The Palmer Tyre, Ltd. (Stand No. 164), for 1912 will have several new patterns in tyres, in addition to the rubber-studded model introduced this season. These will be an improved ribbed tyre, the ribs of which will be both thicker and wider, and a new heavy fabric motor cycle cover, which will be made both ribbed and rubber studded. The ordinary fabric tyre will be made the same as last year, except that it will have an improved and wider tread, while it is also made in the studded pattern. A new type of tyre will be known as the "Privateer," the chief feature of which will be its low price.

It is interesting to note that the Palmer Tyre, Ltd., has introduced a 650 x 65 mm. ribbed tyre specially for sidecar work.

The firm has been specially generous in encouraging the motor cycle pastime this year, and has presented no fewer than four cups and six tyres to be competed for in various local club competitions. F. E. Pither is using Palmer cord tyres for his attempt to establish a long-distance sidecar record.

Michelin.

The Michelin Tyre Co. (Stand No. 24). No special innovations have been made in Michelin tyres for the coming season, as the existing models have been found to give entire satisfaction. Two types of tyres for lightweight machines will be shown with square treads and both wired-on and with beaded edge, and the well-known Michelin "Semelle" non-skid tyre in both wired-on and with beaded edge types. These covers are beautifully made and are manufactured in all sizes.

Hutchinson.

The chief novelty of Hutchinson tyres will be a new rubber studded tread, which will be seen on the three Hutchinson tyres at Stand 26. They are known as the "passenger" type, the "T.T.," and the "Brooklands."

Yet another innovation will be a new light car cover for passenger machines, made in two sizes—650 x 65 and 700 x 65. The smaller diameter cover fits light car rims, but the larger one fits the 28 x 2 rims of the Indian.

Section of the Hutchinson butt-ended tube, showing the extra strong joints.

The butt-ended tube sold by the firm has been considerably altered for next year, and the accompanying illustration will show that the ends where the strain occurs have been considerably thickened and strengthened.

Hutchinson tyres have had this year a record of which their makers may be proud. Machines finishing 2nd, 3rd, 4th, and 5th in the T.T. race were shod with these tyres, and in the Six Days' Trial twenty-six machines entered using these covers gained twenty-six awards.

Section of the new rubber studded Hutchinson cover.

Accessories of the Show.—

Miller Lamps.

Mr. Miller recently showed us a neat motor cycle lamp and generator. The lamp is fitted with Mangin mirror reflector and can be swung to any desired angle. A special bracket can be supplied to carry both lamp and generator.

Powell and Hanmer

are producing a larger motor cycle lamp fitted with Mangin mirror reflector with adjustable focus burner and an adjustment for the angle at which the lamp is to be set. There will be no alteration to the generator. The lamp can be seen at the car Show.

Fafnir Engines.

The Fafnir engine was one of the first to be fitted to a motor cycle, and from the earliest days of the movement it has gained for itself a reputation for efficiency and good workmanship. It is true that not so much has been heard of this well-known engine of late years, but the recent wonderfully rapid growth of the motor cycle movement has brought it once again to the fore. These engines, which are the production of the Aix-la-Chapelle Steel Works, for which Messrs.

The new pattern Dunlop cover showing triple row of studs.

Strauss and Co., 211, Upper Thames Street, E.C., are the representatives, will be seen at the coming Olympia Motor Cycle Show on the stand of the Chater-Lea Manufacturing Co., Ltd. (Stand No. 112). Three types will be on view: The 2½ h.p. for lightweights, 70 × 80, with ball bearing crankshaft, gear-driven Bosch magneto, and side by side valves. Similar to this engine is the new type 4-4½ h.p. engine, 84 × 88, to which a handle-bar controlled Brown and Barlow carburetter is fitted. Like the former, it has a ball bearing crankshaft and an internal exhaust valve lifter. The third type is the 5-6 h.p. twin, 70 × 80 mm., with side by side mechanically-operated valves and ball bearing crankshaft. The chief features of these engines are the excellent casting of the radiator fins, the excellent finish, and their good design throughout.

Cowey.

The well-known and reliable Cowey speed indicator will be exhibited by the Cowey Engineering Co. on stand No. 221. No fresh models are being introduced for 1912, the present model having been found perfectly satisfactory in every particular. As many of our readers are already aware, the Cowey dial has very clear indicating figures. These show speeds from ten to forty, ten to sixty, or in a more expensive model, ten to eighty miles per hour. They can also be supplied to suit right or left side of the fork, and with a clip for any standard diameter handle-bar. All models have a mileage recorder.

A Novel Change Gear Transmission.

It has been truly remarked that this year's Olympia will be a variable gear show. Many of the gears that will be exhibited have been described and illustrated in these columns, but we came across quite a new variable gear in Birmingham last week, which will be exhibited by the Dallison Gearing Co. on Stand No. 133. This gear hails from the city of Ottawa, Canada, and is the

Dallison's gear, which consists of a pinion meshing with five circles of teeth on a disc.

invention of Mr. G. J. Dallison. Reference to the line illustration shows that the type of gear somewhat resembles the Lloyd cross roller gear in so much that the changes of speed are effected by moving a driven pinion on the shaft across the face of a disc provided with five circles of teeth placed radially on the disc. We believe the method by which the changes are effected is novel. To enable the pinion to pass across the face of the disc, its teeth are withdrawn until they come entirely out of mesh with the teeth on the disc. When the pinion is moved opposite any other desired circle of teeth on the disc, the pinion teeth are expanded and are again meshed. The power from the engine to the disc is transmitted by spur gearing, teeth being cut on the periphery of the disc and a pinion being keyed to the engine-shaft. The final drive from the propeller-shaft to the road wheel is by worm gearing. When the teeth on the sliding pinion are retracted the machine will run free, the worm wheel on the bicycle hub driving the worm on the propeller-shaft.

The teeth on the disc are somewhat curiously shaped and difficult to describe, as they differ from all accepted forms of tooth gearing used on cars and motor cycles. Perhaps they are best described as oval-shaped studs. The retractable teeth of the pinion are square studs with the corners rounded off. The drawing reproduced is from a photograph of an experimental machine, which we have examined but not ridden; we were, however, assured that the gear changes perfectly and gives excellent results, four passengers having been carried on the one machine up a fairly steep gradient on the low gear of 16 to 1. The top gear is 5 to 1. We pointed out that there is really no necessity to have a bottom ratio as low as 16 to 1, and were informed that three speeds were already under consideration. The gear in its present state adds about 18 lbs. to the weight of a standard machine, and is somewhat crude in construction. The model gear that will be exhibited will be entirely covered in with a metal case, and consequently weatherproof.

New Silencer.

The same firm will exhibit a very novel form of silencer which we illustrate. The interior is made up with a number of small plates which hang vertically and loosely from a plate attached to the lid. The plates are set in alternate rows, first at a slight angle and then at right angles to the side of the box. In the sketch those placed obliquely are marked A, and the others B. The gases take the path shown by the arrows in their entry and exit. The overall dimensions are 5in. long, 3½in. wide, and 3½in. deep. The lid is screwed to the body, and between the edges is placed an asbestos washer. We have not had an opportunity of testing the silencer or hearing an engine run with it, but Mr. Dallison informed us that he had run an engine at the rate of 3,500 r.p.m. on the stand without apparent back pressure. Another claim for it is that if the engine be over lubricated smoke will not issue from the exhaust pipe, as the burnt lubricant is caught on the plates.

A novel design of silencer—the Dallison, described on this page. It will be exhibited on Stand 133 at Olympia.

The Senspray Carburetter.

Charles H. Pugh, Ltd., will show their new "Senspray" carburetter on Stand 259, as well as a set of frame lugs for building motor cycle frames. These lugs are cold pressed and welded, and are stronger than ordinary steel stampings or malleable castings. The carburetter, which was fully described and illustrated in these pages on Oct. 5th, 1911, gives perfect atomisation with the admission of all air past the jet. The vaporisation is performed in exactly the same method as in a Venturi spray. The power of the vaporiser is such that the setting of the petrol level is a matter of no consequence. Amongst other ingenious contrivances in connection with this carburetter is the rack and pinion arrangement for the control levers on the handle-bar, the wires being attached to the end of the rack, the action thus being a straight pull, obviating any possibility of breakage of wires. The special feature of the Pugh carburetter are the duplex spraying jet, which is formed by fitting the nozzle proper into an air cone and the unimportance of the petrol level.

Accessories of the Show.—**Service Specialities.**

As may be expected almost every known accessory on the market will be seen on the Service Company's Stand No. 292. Among these we may mention two useful methods of giving audible and efficient warning, which are a foot controlled whistle, and the handle-bar controlled "Service Warbler," which is a type of "nightingale" whistle. The "Fitzall" spanner, illustrated in another part of this issue, will be another feature, and the "Votalite" lighting set, consisting of a dynamo driven off the front wheel lighting an electric lamp. In addition to the above the Binks, C.A.P., and other well-known carburettors will be shown, the A.L. generator, the Service belt and belt dressing, which has lately been introduced, as well as various makes of mud-guarding devices. The firm's clothing exhibit will also be worthy of special attention.

A New Tyre Repair.

H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W., have introduced a method of repairing cuts in tyres automatically by means of a plug of rubber and a disc called the "Limpet." The cut is first cleaned, and then the prepared plug of rubber is solutioned into the hole in the cover over which is clamped the "Limpet" disc, which has four arrow-headed points projecting from it. The idea is that the heat generated by the friction of the tyre on the road will vulcanise the plug to the cover, and after a run of an hour or two it is claimed that the "Limpet" disc may be withdrawn and the repair is complete.

Dunhill's Lamps and Clothing.

Our readers may be sure of an interesting exhibit on Messrs. Dunhill's stand, No. 232. First of all we may mention the Dreadnought motor cycle lamp. This lamp is perhaps a little large for the ordinary type of motor bicycle, but it is especially suitable for heavy sidecar machines, tricars, and light four-wheeled motor cycles. It is of the self-contained type. The generator is built on sound lines, and is provided with filters for the gas after it leaves the generator and at the bottom of the burner. The pipes running from the generator to the burner and the water pipes are made as accessible as possible, so that at any time a wire

Details of the Stuart adjustable pulley. A is the stepped adjusting ring (see page 1173).

may be pushed through for cleaning purposes. The lens is of the Mangin type, and the lamp is supplied complete with bracket. A further lamp is an electric one fitted with an adjustable bulb holder, which is also sold complete with bracket.

Other novelties which we may mention are a racing cap fitted with ear flaps, and possessing two long extensions which are intended to be used as a muffler; a numerous variety of mascots for motor cycles, including well finished metal models of numerous birds and beasts; a serviceable pair of hand warmers made of American cloth and lined with wool, intended to be strapped over the handles; an electric lamp lighted by a dynamo and driven by friction off the front wheel; while the greatest novelty of all is an electric hand heater, which is kept hot by means of an accumulator. In addition to the above the firm will have an imposing exhibit of various articles of clothing, such as frieze jackets, waterproof overalls, caps, goggles, and gloves.

Rom 3in. cover to fit 2½in. rim.

Rom Improvements.

The chief novelties shown by the Rom Tyre and Rubber Co. on Stand 157 will be a 26in. by 2½in. extra heavy combination tyre, made to fit 2½in. or 2in. rims, the section of which will be rather larger than that of the standard 2½in. cover, a 26in. by 3in. heavy tyre to fit 2½in. rims, and a 650 by 65 mm. voiturette cover fitted with a special extra heavy tread of greater thickness than the standard. The chief patterns which will be maintained in 1912 will be the well-known combination rubber and steel-studded type, which has been so successful, the square ribbed studded pattern, which is made in nine different sizes, the rubber bar non-skid, and the heavy racing tyre.

Peter Union.

Three different patterns of motor cycle covers made in all sizes will be the feature of the Peter Union Tyre Co.'s stand (No. 29). They are the ordinary type, the twin-ribbed type, and the steel studded non-skid. In the latter, it will be remembered, there are two rows of studs and the studs are placed

fairly wide apart. In form these tyres have not been altered in any way, as they have been found to be thoroughly satisfactory. Another feature of the Peter Union Tyre Co.'s exhibit will be the "Peter" puncture-proof band. A band of rubber is inserted between the tube and the inside of the cover, so preventing most punctures.

Steel-rubber Tyres and Belts.

Wood-Milne, Ltd., have not hitherto marketed a motor cycle tyre, but in response to the demand for a tyre incorporating their successful steel rubber tread they will exhibit on Stand 46 motor cycle tyres to fulfil all requirements.

These tyres are built in three different patterns. The Rubber Studded, the Skewrib, and the Combination Steel Studded, all with the patent steel-rubber tread.

The Rubber Studded and Skewrib patterns are made in two weights, the Special and the Extra Special.

Brooks Saddles and Seats.

At Stand 279 in the Gallery, J. B. Brooks and Co., Ltd., Criterion Works, Birmingham will exhibit a full range of their saddles and seats. These will be of special interest to motor cyclists, and a feature which will most strongly appeal is the Brooks patent compound spring, a device which is both clever and ingenious, and, at the same time, ensures both absorption of vibration and elimination of that common fault—a tendency to bounce unduly. This spring is fitted to various models suitable either for light or heavy weight machines, as also a large and luxurious motor cycle seat which is designed expressly for use on machines of the non-peddalling type.

In addition there will be included the many tool and touring bags which are produced by this firm. These include pannier bags, carrier bags, spare belt and tube cases, carbide carrier, repair outfit case and spare tube box, all of which are constructed of weatherproof materials and provide absolute protection for their contents.

Surridge Patches.

R. Surridge and Co. will be exhibiting on Stand 140 Surridge "Holdtite" patches, which are now so well-known among motor cyclists. This year the patch has been improved by the insertion of stockinette between the two faces of the patch, and as before the patch is designed to stretch only in one direction, the arrow on the patch denoting that it should be placed across the tube.

Exhaust lifter mechanism on the 1912 Rudge.

PRECISION ENGINES FOR 1912.

Precision engines will be found on the stand of F. E. Baker, Ltd. (No. 253 in the Gallery). In addition, Mr. Baker told us last week that he had ninety-six engines ordered for various customers who would show them fitted to their machines.

Great strides have been made by this firm during the last twelve months, and they now have, in addition to the Moor-som Street factory, an excellently equipped fitting shop at the works of Messrs. Webley and Scott, the well-known gunmakers in Birmingham. We recently made a tour of the two factories, and were very much impressed with all we saw. Very little alteration is being made in the design of these engines for

Showing design of the adjustable tappet on the 1912 Precision.

1912, which is a proof that they have been satisfactory. Mr. Baker, however, showed us one or two items which will interest readers, although they only lie in the direction of detail improvement. One item is an adjustable tappet rod. This has been introduced to allow for wear which takes place on the end of the timing gear bell cranks. The line sketch shows that the thread of the loose table top is cut rather fine, whereas the lock nut has a rather coarse thread. This provides a differential locking device which should give no trouble. Many readers may think that adjustable tappets are scarcely necessary, but a considerable amount of wear takes place on the end of the bell crank lever, and unless there is some provision for adjustment the very best timing results cannot be obtained. Wear on the table top is often not so important as wear on the end of the bell crank.

Another device which Mr. Baker

showed us was a variable pulley gear with which the firm are experimenting. F. E. Baker, Ltd., do not sell complete motor cycles, only engines, but the variable gear will probably be sold with the $2\frac{1}{2}$ h.p. unit. It is a variable pulley gear used in conjunction with a jockey pulley with considerable success by a French firm named Terrott, of Dijon. The jockey pulley is fixed midway between the rear belt rim and the engine pulley, and a five-eighth or three-quarter Whittle belt is employed. Operation of the jockey pulley is by means of a handle and reel on the top tube, which winds or unwinds a cord. The same movement of the handle also expands and contracts the pulley flanges.

Precision engine plates and lugs are now being made with a suitable bracket to take the new counter-shaft gear made by the Bowden Wire Co. and recently described in these pages.

The Precision lug is shaped to fit the box, and the engine plates are made with rearward ears through which passes

Showing control of the new counter-shaft gear on the 1912 Calthorpe-Precision.

a bolt connecting the front portion of the gear box to the frame. At the Precision works we saw an interesting process by which the compression ratio of Precision engines is measured. Although this is a manufacturing process, it will interest enthusiastic motor cyclists, and we therefore describe it. It is an extremely difficult matter to arrive at the exact compression ratio of an engine by calculation on the drawing board because allowance has to be made for pockets and also shrinkage in the castings, etc. Therefore the actual compression ratio can only be definitely determined after the engine is assembled. Whenever a new model is completed a graduated glass tube provided with a tap and called a "Burette" is inserted through the compression tap hole. The engine is then placed with the piston at the top of the stroke and the combustion head and pockets are filled with water; by turning the tap of the burette in the case we saw this amounted to 136. The engine was then turned to the bottom of its stroke and again filled up in a similar way, and the amount registered was 635. By division we get a compression ratio of 5.1 nearly and by subtraction a cubic capacity of 599 for that particular engine.

A New 6 h.p. Twin

A new model 6 h.p. twin (see page 1181) has been introduced with the object of meeting the demands for an efficient and powerful engine for sidecar work. It is not essentially a racing engine, although quite capable of high speeds. It can be supplied as a complete unit with twin inlet pipe, exhaust pipes, magneto transmission, and silencer. Both valves are mechanically operated, and the crankshaft is fitted with ball bearings. The exhaust valve lifting device is neat, and the Precision adjustable tappets referred to above are included. The bore is 75 mm. and the stroke 85 mm., total cubical capacity 760 c.c. The angle of the cylinders is 50° , and the belt line, which is the distance from the centre of the engine to the centre of the belt pulley, is $2\frac{3}{4}$ in.

More Rudge Records at Brooklands.

Not satisfied with his already excellent performances at Brooklands, W. Stanhope Spencer started on Monday last on his $3\frac{1}{2}$ h.p. Rudge on an attempt to break the 150-mile and three-hour records for 500 c.c. engines. Not only was he successful in beating these two records in Class C, but he also broke the three-hour records in Classes D and E, Class D being for a maximum capacity of 750 c.c. and Class E for a maximum capacity of 1,000 c.c. Also, he established 200-mile records in all three classes.

The new Rudge silencer, three different types of which were passed by the B.A.R.C. last week, gave excellent results, and the Rudge-Whitworth Co. and W. Stanhope Spencer are to be congratulated on such excellent performances. For a single-cylinder engine to beat the three-hour records in Classes D and E, made with engines of 662 and 964 c.c. respectively, is quite an extraordinary per-

formance. Rhys was also careering round the track, his object being to annex the six-hour record, but he retired after covering forty laps—about 108 miles.

Official Times and Distances.

Below will be found Stanhope Spencer's times and distances with previous best performances: Class C: 150 miles, 2h. 38m. 13s. (previous best, 2h. 51m. 17s., F. A. McNab, June 22nd, 1910). C, D, and E: Three hours, 171 miles 1,764 yards (previous bests, Class C—McNab, June 22nd, 1910, 158 miles 548 yards, Class D—C. B. Franklin, 161 miles 1,545 yards, June 22nd, 1910, Class E—H. Martin, 165 miles 930 yards, November 22nd, 1909).

Spencer also established records for 200 miles in Classes C, D, and E; time 3h. 28m. 51s.

The weather was bitterly cold, and the wind blew at a speed of 40 to 50 m.p.h.

When riding against it Spencer's speed was reduced to 25 m.p.h., and although he wore two waistcoats, two sweaters, and a leather suit he was unable to keep sufficiently warm.

M.C.C. Winter Run.

The second winter run, London-Exeter and back, will be held on December 26th and 27th.

REGULATIONS.

Meeting Place.—At the Bulstrode Hotel, adjoining Heston-Hounslow Station, Tuesday evening, December 26th, starting at 7 p.m.

Route.—The route to be followed, starting from Hounslow, is *via* Basingstoke, Salisbury, Shaftesbury, Yeovil, Chard, Honiton to Exeter, and back in the reverse direction.

A stop of one hour will be arranged at Salisbury, both ways. About two hours will be allowed at Exeter.

CURRENT CHAT

TIME TO LIGHT LAMPS.

Nov. 9th	...	5.18 p.m.
" 11th	...	5.15 p.m.
" 13th	...	5.12 p.m.
" 15th	...	5.9 p.m.

Quarterly Trials Abandoned.

There will be no A.C.U. Quarterly Trials next year; instead, a couple of one day reliability trials—one in the spring and one in the autumn. These events will be supported by the trade as in 1910, and so will be thoroughly representative.

3,000 Miles in Three Weeks.

Advices as to F. E. Pither's progress in his attempt to cover 3,000 miles in three weeks on a two-speed $3\frac{1}{2}$ h.p. Rudge and sidecar show that the weather has been most unpropitious for such an arduous test, and it is extremely unlikely that Pither will succeed in his object.

Accident at Brooklands.

We understand that H. T. Lloyd, who was injured at Brooklands while riding a Triumph motor bicycle one day last week, and had to be removed to the Weybridge Cottage Hospital, is progressing satisfactorily. Lloyd was tuning up a machine for record, and ran into an obstruction warning track users that repairs were in progress. He unfortunately suffered a broken jaw.

R.A.C. School of Tuition.

It is found that some pupils at the Royal Automobile Club's school of tuition in car driving and mechanical matters can only gather a hazy notion of the working of a four-cycle engine when confronted with a four-cylinder car engine. A single-cylinder motor cycle engine, in the shape of a $3\frac{1}{2}$ h.p. Rudge, with parts of the cylinder and crank case cut away in order to show clearly the principle of the four-cycle type, has therefore been installed.

Harry Long's Ride.

In course of conversation with Mr. Harry Long in Coventry last week he informed us that it is his intention next year to attempt to beat his 1911 record on a motor car. He will start from and return each day to his home, and may drive a Vulcan which is made in the Lancashire watering place, Southport, where Mr. Long resides. The question he asks himself is, "Shall I beat the motor cycle record?" The Triumph motor bicycle used for the ride will be on the Triumph stand at the Show, and although it will be cleaned no fresh enamel or plating will be used. Mr. Long himself will also be pleased to meet his friends and acquaintances at the stand, where he will be stationed each day from the opening of the exhibition.

A Severe Test.

A Cheltenham reader sends us a cutting from a local paper, from which we gather that a $2\frac{1}{2}$ h.p. A.J.S. lightweight, with two-speed gear, climbed Birdlip last week with a passenger on the carrier.

Next Year's B.M.C.R.C. Dates.

The following dates have been suggested for next year's B.M.C.R.C. race meetings at Brooklands: March 23rd, April 20th, May 11th, June 1st, June 29th, July 20th, August (any Saturday except fourth), September 14th, October (any Saturday).

The A.C.U. and Provincial Clubs.

We have received a lengthy letter and explanation of the methods adopted by the R.A.C. and A.C.U. in dealing with the question of affiliation of one of the Northern clubs. Unfortunately we received this letter too late for insertion in our correspondence pages, but we hope to publish it next week. The writer of the letter strongly advocates the formation of a Northern Association to deal with clubs in Northumberland, Durham, Cumberland, Westmorland, and Yorkshire, and suggests a conference should be held at Harrogate.

The Trade and the T.T.

Mr. B. Mariani, an enthusiastic rider and one of the directors of Phelon and Moore, Ltd., writes us regarding the Tourist Trophy Races and the decision of the A.C.U., and says that the Competitions Sub-committee of the A.C.U. have probably given the matter consideration, but the General Committee who represent affiliated clubs have had no opportunity to say a single word for or against the makers' suggestion for a race at Brooklands. He thinks the lack of trade support will mean a loss to the organisers, and speaking as one to whom it makes no difference where the race be held, he says the A.C.U. has made a mistake.

L. W. Fox, hon. sec. of the motor cycle section attached to the Brookdale Cycling and Social Club. He rides a $3\frac{1}{2}$ h.p. Bradbury and sidecar.

SPECIAL FEATURES.

WORLD'S RECORDS AT BROOKLANDS.

THE ADJUSTMENT OF LAMP BURNERS.

Hill-climbing at the Cape.

A flexibility hill-climb, promoted by the Cape Peninsula Motor Cycle Club, on the 7th ult., was won by the Rev. S. B. Preston on a $3\frac{1}{2}$ h.p. two-speed P. and M. His fast time was 1m. 16 $\frac{1}{2}$ s., slow time 6m. 22s., difference 5m. 5 $\frac{1}{2}$ s. Second, A. Keyzer (4 h.p. Scott), fast 1m. 8 $\frac{1}{2}$ s., slow 3m. 46 $\frac{1}{2}$ s., difference 2m. 37 $\frac{1}{2}$ s. Third, T. R. Butler ($3\frac{1}{2}$ h.p. Zenith-Gradua), fast 1m. 8 $\frac{1}{2}$ s., slow 3m. 45s., difference 2m. 36 $\frac{1}{2}$ s. A. Douglas ($3\frac{1}{2}$ h.p. Triumph) made the fastest ascent in 1m. 5 $\frac{1}{2}$ s., but failed in the slow test.

Rear Red Lights Compulsory in Warwickshire.

An active campaign in favour of rear red lights on all vehicles has been pursued in Warwickshire for some years, and we believe we are right in saying that the Coventry and Warwickshire Motor Club was the first body to draw up a petition for presentation to the county council in favour of the compulsory lighting of cattle and all vehicles. At the time, the recommendation was rejected without the consideration it deserved, but all readers will be pleased to hear that at last Saturday's meeting of the Warwickshire County Council, held at the Shire Hall, Mr. J. Stratford Dugdale, K.C., presiding, on the recommendation of the County Roads and Bridges Committee, it was decided "to make a new byelaw as to the lighting of vehicles, requiring all such to be provided with a red rear light or a reflector so constructed as to reflect a red light from the lights carried by vehicles approaching from behind."

The Noise Nuisance

The prejudice against motor cycles caused by unnecessary noise reached another stage on Saturday when the Warwickshire County Council had before them a report from the County Roads and Bridges Committee as follows: "We have had before us a letter from the Kenilworth Urban District Council complaining of the fast driving of motor cycles through the town, and the nuisance caused by the ear splitting and rest disturbing noise emitted from such machines, and urging that steps should be taken for reducing the speed limit of such machines. We have drawn the attention of the chief constable to the complaint."

Next Week's Issue

of *The Motor Cycle* will contain our annual Buyers' Guide, as also a continuation of our forecast of 1912 models to be exhibited at Olympia. Thursday, November 23rd, is the date of our complete Show report, written and illustrated by our own staff after a personal inspection of the exhibits.

Humber Activity at Brooklands.

P. J. Evans writes that the 2½ h.p. twin Humber he used at Brooklands on October 25th was an ordinary roadster machine originally fitted with beaded-edged tyres and three-speed gear, and had not been specially tuned up. Although it was his first attempt at Brooklands he rode 51 miles 1250 yards in the hour.

The Olympia Motor Cycle Show.

234 exhibitors have already booked space for the Olympia Show, November 20th to 25th. Of these exhibitors, 169 will show complete motor cycles or accessories for motor cycles. Out of the total number there are twelve stands devoted to motoring and kindred publications, so that the percentage of motor cycle exhibitors at this exhibition is 76.1.

Stand-pipes for Petrol, Air, and Water.

A year or two ago footpath supply stations for petrol, air and water, were referred to in Christmas stories in these pages as possibilities of the distant future. They are realities in the U.S.A., as the Geyser Company, of Indiana, is prepared to fit a stand-pipe for a combined petrol, air, and water supply in front of any garage, hotel, etc. The company particularly points out that air for the tyres and water for the radiator are big inducements for motorists to stop.

A Romance.

Lieutenant C. J. Janssen, late of the Danish Dragoons, who is well-known to our readers as a rider of a Moto-Rève motor cycle in numerous competitions in 1910, produced last week at the Oxford a ballet sketch "The Abduction." Those who knew Mr. Janssen will be sorry to hear he has had to give up motor cycle riding. Last New Year's Eve he was run over by a taxicab in Copenhagen and had both legs broken. In the cab was Mlle. Karina, of the Royal Opera House, Copenhagen. This lady, whom he recently married, takes a prominent part in the sketch above referred to.

A Crock (?)

An amusing little incident occurred at a recent motor cycle hill-climb. A class was set aside for skilful driving, and competitors were expected to see how far up the hill they could induce a certain "crock" to go. Now we were informed by one who ought to know that this "crock" would never climb the hill. True to its reputation, on being started up it stuck with a "wump," and another machine had to be borrowed for the competition. Shortly afterwards it was discovered that the pulley on the original crock had screwed up tight against the crank case. When this was put right we hear that the so-called "crock" surprised everyone by going up the hill at such a pace as to necessitate cutting out at the corners!

FUTURE EVENTS

Nov. 3-11.—Olympia Motor Show (see "The Autocar").

" 20-25.—Motor Cycle and Cycle Exhibition at Olympia.

Dec. 9.—M.C.C. Annual Dinner at the Café Monico.

" 26-27.—M.C.C. Winter Reliability Run to Exeter and back.

" 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions

Dangers of the Road.

To prevent street accidents particularly to children should be the laudable endeavour of every charitably disposed person. A. Brown and Sons, Ltd., educational publishers, 5, Farringdon Avenue, E.C., have sent us some small reproductions of two pictures they have had drawn for hanging in schools. The drawings depict the consequences of hanging on behind carts and similar vehicles and should act as a warning to children to exercise more caution in these days of crowded streets congested with fast moving traffic.

The Motor Cycle in South Australia.

The opening run of the South Australian Club for the season 1911-1912 took place on September 23rd; thirty members and a number of visitors were present. The destination was National Park, Belair, a public recreation reserve situated in the hills about ten miles south of Adelaide. Several new models were brought out for the first time, including Indian, B.S.A., and Lewis (3½ h.p. water-cooled), whilst Triumphs, Nortons, N.S.U., Rex, and Royal Enfields were well represented.

OPENING RUN OF THE MOTOR CYCLE CLUB OF SOUTH AUSTRALIA.

Some of the members in the National Park, Belair, ten miles south of Adelaide.

The captain, W. W. Sampson, drove his forecar, and four members were mounted on 3½ h.p. water-cooled Lewis machines with sidecars. After a short programme of sports had been carried out, the members partook of tea.

The Autumn Quarterly Trial.

The name of J. H. Purcocks has been added to the list of non-stop competitors in the last A.C.U. Quarterly Trial. It appears that Mr. Purcocks was impeded on Farlow Bank by another competitor who fell, but he did not stop the engine of his two-speed Alldays, and succeeded in reaching the summit unaided. He placed the above facts before the A.C.U. Committee, who have considered his appeal, and have awarded him a non-stop certificate.

M.C.C. Second Winter Run.

The regulations for the above run will be in members' hands this week. The date has again been fixed for December 26th and 27th, and the only alterations are that the schedule through the night has been speeded up by one mile per hour, making it about sixteen miles per hour.

Special emphasis is laid on the rules re quiet driving, the M.C.C. committee feeling very strongly that if motor cyclists do not mend their ways themselves, irksome regulations enforced by the police are inevitable.

Cinematograph Show at Olympia.

Every day during the Motor Cycle and Cycle Show a continuous series of cinematograph displays will be given from 2 to 9 p.m. in the balcony tea room, including views of cycling, motor cycling, and motor boating events, admission sixpence. The room being lent gratis by the management, the entire proceeds will be devoted to the Cycle and Motor Trades Benevolent Fund. The programme will be entirely changed every day, except that the most popular pictures will be repeated. Each display will last approximately forty-five minutes.

Auto Cycle Union Notes.

T.T. RACE.—The most important decision at the last meeting of the A.C.U. was to hold the T.T. Race in the Isle of Man next year. We deal with this matter editorially.

MEMBERSHIP.—Sixty-two new members were elected at a recent committee meeting of the A.C.U.

THE 1912 A.C.U. PROGRAMME.—The following trials will be held by the Union in 1912: Two one day trials—one in the spring and the other in the autumn (to take the place of the Quarterly Trials); the Six Days' Trial (to be run from a centre); the Tourist Trophy Race (to be held in the Isle of Man if the necessary permission can be obtained).

AN IMPORTANT RESOLUTION.—At a recent meeting of the committee the following resolution was passed: "That the Auto Cycle Union shall now reconsider their decision relative to the holding of open and other reliability trials by clubs." This should remove the bone of contention between the provincial clubs and the A.C.U.

WINTER PROGRAMME.—The Auto Cycle Union is now considering a winter programme, to include papers on subjects of interest to motor cyclists.

40,000 Miles in 11 Months

Harry Long's Achievement.

Personal Note by the Author.

FOR at least three years the name of Harry Long has been prominent in the wheel world of England (in his native county of Yorkshire his name has been a household word for twelve years as a record holder and cup winner in contests on the road) owing to his exploits of 1908, 1909, and 1910, when he covered respectively 12,940 miles, 23,241 miles, and 25,376 miles per pedal cycle, all three of which constituted world's records, and colossal figures indeed they are. But his latest achievement per motor cycle to my mind easily eclipses these three performances, and the least generous of Mr. Long's numerous friends and admirers (and, mark you, all prominent and popular men have some admirers less generous than others) must acknowledge that this feat of covering 40,000 miles in eleven months on a

motor cycle is a remarkable achievement. Even the most ardent motor cyclist at times tires a little of constant riding and desires either a change or a long stop at his journey's end, but to Mr. Long it has meant one constant grind—no matter whether his inclinations were bent on a rest or not, he had to stride his mount and get out on the open road or his total could not have been reached. It requires tremendous will power and determination to adhere to a pursuit to this extent.

As I have competed against him on a push bicycle, helped pedal a tandem with him in many competitions against time, and now, on his last performance, I have accompanied him many hundreds of miles, a line or two of my personal impressions may not be out of place.

AN ADMIRER.

Characteristics.

Practical, very serious, and crammed full of enthusiasm for the sport and pastime of motor cycling, and withal successful in his strenuous capacity as record maker, thus I describe this marvellous mile-eater. Possessed of a laudable ambition to shine, and though he may not know it himself, this is the real mainspring that gives life and movement to the labour he loves so well, and his best reward, I am sure, is the appreciation of his fellow motorists. With a wonderful energy, a congenial and happy personality, and the rare gift of imparting enthusiasm to all with whom he comes in contact: in his peregrinations he has made a host of friends, and probably no enemy, he counts an indomitable pluck and a knowledge of the geography of his own country as most valuable—such is the man as I have found him at all times.

The first notice of any moment I received from this rider anent his record ride was a postcard, dated January 6th, from Coventry, where he had gone to take possession of his $3\frac{1}{2}$ h.p. free engine Triumph. I cannot do better than give the P.C. *in extenso*. He says: "Having just finished my ride of 25,376 miles on a push cycle, I arrived yesterday, 3rd January, at Coventry, with overalls, ready for my new venture on a petrol mount. As you said, I was only ten minutes learning to ride the Triumph. Mr. W. F. Newsome put me through, and after ten minutes we started on a twenty miles run, and to-day we have done fifty miles. To-morrow (Friday) I drive it to Southport, 140 miles, alone."

Thus did Harry, as he is popularly known, enthuse on his first postcard out of hundreds I have received from all parts of the British Isles. During the early months of the year his experiences were very rough, and from January to the

last week in March he had not a single day's riding on really dry roads. One of his worst experiences was on January 27th, when he travelled from London to Doncaster in a blizzard of snow all day, and was almost perished with the intense cold; at least a dozen times the rider had to dismount and dance about to restore circulation.

The whole of the winter riding was, in fact, simply mud plugging, and on many occasions he wrote to me almost throwing up the ride in disgust, but his persistent efforts were rewarded with the glorious summer, such as we have not experienced for many years, albeit the excessive heat was at times very trying.

An Early Venture.

His first long ride was a daring venture for so uninformed a motor cyclist, seeing he essayed the task of riding from Southport to Land's End, and this in February, which bears the reputation of being the wettest month of all the year. February was true to its name of "fill dyke," and he experienced heavy roads and rain every day, and over the Devonshire hills found plenty of hill-climbing to satisfy his most ambitious desires.

A striking feature of his riding is that he has never yet carried a lamp, not caring for night riding, and this whim of fancy has led him into heaps of exciting sprints to reach his home or his set destination before dark.

A brief analysis of his ride shows me that for ten weeks in May, June, and July he averaged actually 1,000 miles per week, and out of the total months he has been riding he has only had thirty-five days on which he has not done some motor cycling, and deducting these, his ride averages 1,000 miles per week for the whole forty weeks.

INCIDENTS OF HARRY LONG'S MOTOR CYCLE ROAD RECORD OF 40,000 MILES IN 11 MONTHS.

(1) A helping hand.

(2) Which way? Consulting the map with a party of Yorkshire motor cyclists.

(3) A wayside incident

40,000 Miles in 11 Months.—

The tit-bit of his journey was, of course, his ride round the coasts of England, Scotland, and Wales. This stupendous task was, to my mind, much the stiffest problem, as the worst hills are to be found on the coast line. There was also the difficulty in obtaining petrol supplies, as his wanderings at times landed him well off the main highway in his quests for post offices on the sea coasts, and in not a few cases these proved to be in awkward corners.

In many parts of the Highlands the gradients are most severe, the remarkable Applecross Hill being one of the stiffest climbs, rising, as it does, nearly 2,000 feet in five miles. For the whole ride he took thirty-two days, covering in this time 5,043 miles; his greatest day's mileage was 280 miles and his shortest fifty miles, the average per day working out at 157 miles.

En route he had twice to sleep in the open, and on numerous occasions was wet to the skin, despite his overalls, and

the constant rain, which hunted him for ten days on end in Scotland, made the road so bad that at times ten miles per hour was only kept up with difficulty. Only a man of Harry Long's extraordinary stamina, endurance, and experience dare attempt such a performance. I can imagine his plights as he plugged along through the mud day after day, struggling with the apologies for roads up the mountain passes of West Scotland. The average motor cyclist may say that he oftentimes does his 150 miles per day, but let him set out to average this for forty weeks, wet or fine, rain or shine, and he will speedily find that the compulsory part of the bargain takes out all the romance, and it becomes a stern reality.

His 3½ h.p. Triumph, free-engine model, has carried him right through the task, the tyres being Kempshalls, extra heavy on the driver and the anti-skid on the front, Lyso belts, and Bosch magneto. Harry Long completed his 40,000th mile in London at 1.30 p.m. on Thursday last week, and he is in splendid health.

Items of Interest at the Car Show.

HERE and there at the Olympia Car Show one or two items of special interest to motor cyclists are to be found, a few of which are equally well applicable to either motor cycle or motor car.

The first thing we examined was a Simms motor cycle magneto with both ends of the magnets closed in so that the wet is entirely excluded. The high tension lead issues through a wet-proof terminal. The contact breaker, however, is left unclosed, but the Simms Magneto Co. assure us that the contact breaker is, and always has been, entirely waterproof. In appearance this magneto is particularly neat and compact. Quite a novelty on this stand which has not yet been adopted for motor cycle work, but will, we gather, shortly be adapted to a motor cycle magneto, is the Simms universal transmission coupling and automatic advance and retard. The coupling consists mainly of two curved discs, one concave and the other convex. The concave disc attached to the magneto has a semi-circular groove cut diametrically across it; the convex disc has two curved grooves in which lie two large balls, while two smaller balls are placed in sockets to allow the two discs to move easily in relation to one another. As the speed of the engine increases the large balls fly outwards in the curved guides, acting like a centrifugal governor, and alter the relation of one disc to the other, thus advancing the spark. When the speed decreases the governor balls exercise the opposite effect, and the spark is automatically retarded.

C. A. Vandervell and Co. showed us their well-known electric motor cycle head light, which has been considerably improved both as regards general design, and has been made to sell at a considerably cheaper price.

The Skew non-skid tyre is exhibited by Oyleys, Ltd. There are two types for motor cycles, one the anti-skid type, with round tread, and the other the non-skid with square tread.

A useful sight-feed lubricator worked by the vacuum in the crank chamber, and a filler cap with a bayonet joint are the two chief items on Benton and Stone's stand.

Miniature Lodge plugs for motor cycle work, and the double pole plug, are on view in the Gallery.

Harvey Frost and Co. have introduced a new vulcanising material, known as "Plastene," which allows one to

vulcanise in about one-third the time and with about one-third the pressure.

Drummond Bros. make a speciality of small but strong lathes for the amateur mechanic; incidentally we have seen these lathes in use in quite large shops.

The new Pognon motor cycle plug, sold by H. M. Hobson, Ltd., has the electrodes turned inwards, with a special porcelain end fitted to allow the points to keep

Benton and Stone sight feed lubricator.

Fittzall wrench.

The Skew non-skid cover.

cool. The Claudel-Hobson carburetter for motor cycles can also be examined on this stand.

The Laystall Eng. Co. show examples of repair work they carry out, such as rebored cylinders, welding, etc.

The Motor Accessories Co. have introduced an ingenious spanner known as the Fittzall. It is made in all sizes, with jaws opening from ⅜ in. to 1½ in.

At G. T. Riches and Co.'s stand we saw the Brooklands detachable leather non-skid band, lately referred to in *The Motor Cycle*. It is fitted with non-rusting steel studs, and is clipped on the tyre rim.

Oleo plugs and a new preparation known as Petrode are exhibited by Ripault and Co. The latter is a galvanic battery enclosed in a perforated tube which is dropped into the petrol, and by galvanic electrolysis is claimed to increase the affinity of the petrol vapour for oxygen, so obtaining more complete combustion.

The Parsons rapid repair kit, we may remind our readers, consists of a plug which may be pushed through the puncture aperture, and is afterwards clamped up by special pliers.

Powell and Hanmer exhibit a new motor cycle lamp and generator of large size, which is practically a replica of the smaller lamp made by this firm, and so much appreciated by motor cycle riders. The new lamp is a particularly handsome one. It is of the lens mirror type.

The Rotax Motor Accessory Co. showed a well-made lamp of the lens mirror type, of simple construction as regards its exterior and, in consequence, easy to clean. The ventilator is well designed and gives no back glare.

THE NEW SIMMS MAGNETO.
The automatic advance couplings. Complete magneto with enclosed terminals.

CLUB NEWS.

Marlborough A.C.

F. I. Watson, the winner of the solo and sidecar classes in the hill-climb, rode a single-geared $3\frac{1}{2}$ h.p. Premier, not a Bradbury as previously reported.

Chesterfield and District M.C.C.

The official results of the reliability trial held on the 25th ult., over a course of sixty-five miles in Derbyshire, are as follows:

Sidecar class.—1, Jack Haslam (6 Zenith) lost 14 marks.
Solo class.—1, Frank Kelly ($3\frac{1}{2}$ Bradbury) lost 43 marks.

Streatham and District M.C.C.

The formula figures in connection with Class II. of the open hill-climb at Brasted have been checked, with the result that E. W. Cheshire ($3\frac{1}{2}$ h.p. Triumph), who made fastest time in this class and was given as fifteenth on formula, takes fourth place, the figure of merit being 443.

North Middlesex M.C.C.

The winter season opened on the 29th ult., when an all-day run was indulged in over a circular route of about one hundred miles. All are requested to make a special effort to meet at the Gatehouse, Highgate, at 10.30 each Sunday morning during the winter months.

The Bristol B. and M.C.

The annual dinner, at which the prizes won by members will be presented, will be held on Saturday, November 11th, at the Royal Talbot Hotel, Victoria Street, Bristol, at 6.30 p.m. The club heartily invites Messrs. Alec Ross, Cooper, Moorhouse, Reed, Newsome, Brewster, and Slaughter. Others can obtain tickets from the secretary, Mr. Philip Grout, Wormley, near Bristol, at 3s. 6d. each.

Oxford M.C.C.

A breakdown competition took place on October 27th at the Creamery Café, which was won by Mr. H. Askew. This was followed by a musical social to celebrate the winning of the Auto Cycle Union Championship. During the evening, the Rev. Mansell Merry proposed "Success to the Oxford Motor Cycling Club," and the challenge cup was handed round. A most convivial evening was spent.

Harrogate and District M.C.C.

The annual general meeting was held on Thursday, the 2nd inst., at the Clarendon Hotel. There was a fair number of members present, a few energetic ones being, however, unable to attend owing to illness. The report and balance sheet, which gave a balance in hand of over £8, was favourably commented upon. Mr. C. A. Nettleton was elected as president in place of Mr. R. Fortune, who was retiring. Practically the same committee was re-elected, as well as the same hon. secretary and treasurer.

Newcastle M.C.

On the evening of November 1st, before an audience of about 250 members and friends, in the Lecture Theatre of the Literary and Philosophical Society, Newcastle, the hon. secretary of the club gave a short discourse on "The Newcastle Motor Club and its Work." Mr. J. R. Atkinson presided. The Hon. Secretary illustrated his description of the many attractive events held in connection with the club over the past five years with about 200 limelight views which had been taken by Mr. Geo. C. Urwin (hon. sec. of the Heaton Camera Club) and himself.

Cambridge University M.C.C.

A successful reliability trial was held on the 28th ult., fourteen members starting on a seventy-seven miles run. There was a control at Hertford, where a stop was made for tea. An observed hill-climb was made at Standon Hill. Results:

1. H. D. Goodwin ($3\frac{1}{2}$ Rudge), silver cup (presented by Messrs. Rudge-Whitworth) and silver medal.
2. S. Russel-Cooke ($3\frac{1}{2}$ Rudge), silver medal.
3. N. B. Stewart ($3\frac{1}{2}$ Arno), silver medal.
4. R. W. Gosse ($3\frac{1}{2}$ Zenith-Gradua), silver medal.
5. E. L. Mather (5-6 F.N.), bronze medal.

The following finished the course: G. Gillan (2 $\frac{1}{2}$ Douglas), T. P. Ellies (2 $\frac{1}{2}$ New Hudson), Mason ($3\frac{1}{2}$ Bradbury), G. E. Cuffe (5 Indian), G. N. Shackle ($3\frac{1}{2}$ Rex), and M. Isaacs ($3\frac{1}{2}$ Triumph).

North-west London M.C.C.

The "O.T." club held its inaugural run on Sunday, 5th November. The start was from Jack Straw's Castle, Hampstead, and the members turned up in full war paint, suitable to the date. To the huge amusement of the crowd Hal Hill led off with his ancient Centaur. Just past Barnet G. O. K. Thomas set his whiskers on fire in trying to light his pipe, very nearly giving a real 5th of November display. At Hatfield the excitement was tremendous, and after a general inspection, they all retired to a spot about a mile away for the bonfire and burning of masks, etc.

This club will hold an entertainment at the Town Hall, West Hampstead, on Saturday, the 18th inst., at 8.15 p.m., which will include the first official performance of the Omacadians, followed by a burlesque entitled the Shamaten's Bride. Tickets, 2s. 6d. each, may be obtained from Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, N.

Edinburgh and District M.C.

The final competition of this season was held last Saturday on Whitebaults Farm Hill, near Linlithgow. This hill is a new one, has a fair gradient, no bad corners, and excellent surface. There was a very good entry, and some fine sport was witnessed. The following are the results:

CLASS III.—Flexibility (Twins).

	Fig. of merit.
1. S. J. K. Thomson (8 h.p. Bat) ...	5.56
2. R. S. Morrison (8 h.p. Bat) ...	5.45
3. J. R. Alexander (7 h.p. Indian) ...	5.14

CLASS IV.—Knockout (Singles).

J. Gerard ($3\frac{1}{2}$ h.p. Bradbury) beat J. S. Turnbull ($3\frac{1}{2}$ h.p. Bat).

P. E. Tolfree ($3\frac{1}{2}$ h.p. Matchless) beat R. H. Mouat ($3\frac{1}{2}$ h.p. Rudge).

Final: J. Gerard beat P. E. Tolfree.

CLASS V.—Knockout (Twins).

R. S. Morrison (8 h.p. Bat) beat J. R. Alexander (7 h.p. Indian).

J. R. Alexander (7 h.p. Indian) beat S. J. K. Thomson (8 h.p. Bat).

Final: J. R. Alexander beat R. S. Morrison.

CLASS VI.—Passenger Class.

	Fig. of merit.
1. R. S. Morrison (8 h.p. Bat and s.c.) ...	4.80
2. J. S. Alexander (7 h.p. Indian and s.c.) ...	3.80
3. S. J. K. Thomson (8 h.p. Bat and s.c.) ...	3.78

A. H. Alexander (7 h.p. Indian) making a slow ascent in Class III. of the Edinburgh and District M.C. hill-climb last Saturday.

FROM THE CHANNEL TO THE ADRIATIC & MEDITERRANEAN & BACK

By Motor Cycle.

By R.M.B.J.

(Concluded from page 1114, October 26th.)

Tuesday, July 4th.—X having spent the morning repairing his tyre and tube, the while a fine drizzle of rain made the roads nicely greasy, we got going at 2.30 for the run round the western side of Lake Maggiore. This road was in splendid condition, and the views were magnificent—mountain on left, lake and more mountains on right. Turning one of the innumerable sharp corners on the rock-hewn road, we suddenly struck the Italian Customs, where our lead seals were removed—I retained mine as a souvenir—and the Italian *permis de circulation* given up. Round another corner was the Swiss douane, which we cleared, and ran on to and through Solduno, whence the road as far as Bellinzona was very bad, with many narrow, ill-paved village streets. Going right up the valley, round the end of the lake until Monte Cenere greets one, is a stiff climb over very loose surface, especially on the corners. After successfully rounding ten "hairpins" in rapid succession, the road rises straight up, and a magnificent panorama is spread out far below on one's right. Then one long "blind" (I forgot I was in Switzerland again) at thirty to forty, over a good road, down through a village, so narrow that a girl taking her stockings off in a doorway had to draw her legs in to let me pass! A further descent to Lugano, with its lovely mountain and lake views, and the Hotel Bristol was reached at 7.30. Day's run, fifty-seven and a half miles.

Wednesday, July 5th, was spent at Lugano, exploring, and going up to Porlezza by steamer, as there is no road.

Thursday, July 6th.—X departed, not on his bicycle, to see his relatives elsewhere, so at 4.15 I set out alone to finish the tour. A rough, bumpy road brings one out over the lake at Melide, and then along the left-hand shore to Capolago, where I had my first experience of having benzina (petrol) syphoned out of a huge tin into litre wine bottles, and thence transferred to my tank. At Chiasso I left Switzerland, and again had a lead seal attached to the frame, and the permit issued. After some difficulty, I managed to persuade the official that I only had clothes on board, and so was spared the annoyance of unpacking. This was the strictest customs I met. Then down into Como and up out of it again over a very bad road, until Lecco appeared—a very pretty picture, at the foot of a perpendicular mass of rock, on the other side of the Lake of Como. Over the bridge, and I was soon at the Hotel Croix de Malte et d'Italie. Day's run, thirty-eight and a half miles.

The Monotonous Plain of Lombardy.

Friday, July 7th.—Leaving at ten o'clock, over bumpy and terribly dusty roads all the way, Brescia was reached at 3.15. Then the road led on through

dirty, badly-paved villages, on over the intensely monotonous plain of Lombardy, with the sun simply blazing down. The towns now are entered through narrow gateways, over a moat, through another gate in the walls, and so into the town. The machine was running splendidly, in spite of heat, dust, and bad roads, and reeling off a steady 30 m.p.h. Verona is an interesting town, with its amphitheatre, gateways, etc. Pushing on, Vicenza (another of the fortified towns) was reached at 9 p.m. 129 miles.

Saturday, July 8th.—Having explored Vicenza, with its painted house walls, cathedral, and so on, I left at 10.30. On the outskirts of the town I had to get benzina; it was *weighed* to me over the counter of a chemist's shop; 2frs. 50c. for four litres, i.e., 2s. 1d. for not even a gallon. The road improved to Padua, a very difficult town from which to find an exit, only to become hopeless to Mestre, with dust *inches* deep. Only those who have seen the Italian dust can realise its terrors. Just short of Mestre, I had some fun in buying petrol at a cottage, which displayed the official "Italian Touring Club—benzina" sign. I could only succeed in buying three wine bottles (litres) full, with the usual admixture of water, as the woman had exhausted her stock. I wanted to fill my tank and spare tin, as petrol was "cheap" here, being only 50c. the litre.

Venice at Last!

The last fifteen miles through Dolo and Malcontenta (excellent names) are dismal: one long straggling line of houses, a canal on the right, and the everlasting electric tram on the left. Having put up my P. and M. at the Garage Reale at Mestre, on the mainland, where there is a lock up for the Italian royal family cars, the boat soon carried me to my goal—Venice and the Adriatic Sea. It was a fortunate evening on which to arrive, as there was a fête, an illuminated procession of boats, and fireworks on the Grand Canal. Forty-seven miles.

Sunday, July 9th.—To-day was spent exploring the Palace of the Doges, the canals, Bridge of Sighs, prison, the Lido, and the bathers (!) in company with an American acquaintance. By the way, a wag has said: "See Naples and die; smell Venice—same result!" Personally, I found Venice quite salubrious, except that cholera was prevalent.

Monday, July 10th, dawned wet and miserable. Fortunately it cleared and having said good-bye to the American, I set sail for Mestre. Leaving the Garage Reale at 6.15 p.m., I had the experience of a muddy Italian road. The way my tyres held the road was nothing short of marvellous, and all through the tour when grease was struck I never had any cause of complaint. Words fail me to describe Italian mud. Soon the engine, which had run faultlessly from England to Venice, began to misfire badly. Plug, contact

From the Channel to the Adriatic and Mediterranean and Back.—breaker, petrol pipe, etc., were all examined, but still the misfiring continued. Three times I had that carburetter down—no good: then, in the dark, I rode, "bang-miss-bang-miss," into Padua, to be hauled up by a gendarme for riding without a light. I looked innocently at the lamp to see why it had gone out, but the fact that it was stuffed full of dusters gave me away! However, I found a haven of refuge, after a trying and tiring ride of only twenty-five miles, at the Hotel Fanti Stella d'Oro. In Padua a B.S.A. motor bicycle was staged in a shop window.

Tuesday, July 11th.—Starting off full of hope that the misfiring would have departed in the night, as mysteriously as it arrived, I was immediately disillusioned. "Bang-miss-bang-miss," it went again; so I "bang-missed" out of the town, and sat down in a shady, deserted spot, determined to do or die. Now what was it? The small lock-nut on the float had slipped down! What a relief it was to get going at our favourite

very picturesque walled town as one approaches it over a long ramp, defended by drawbridges. Following the monotonous, flat road through Cremona and Piacenza (where I was hauled up by the Octroi at the gates), choked with dust, baked with sun, I stopped at a desolate village for petrol, which was measured out to me from three different receptacles—

an oilcan, a wine bottle, and an old tin. During this performance, the only motor cyclist I met on the country roads throughout the Italian run passed on a Triumph. Being anxious to quit the Italian plain roads as soon as possible, I pushed on in the dark to Voghera. 170 miles to-day.

Terrors of the Turin Road.

Wednesday, July 12th, was the most terrible ride I have ever had in my motor cycling experience, viz., from the Albergo Universo, Voghera, to Turin. To begin with, it was blazing hot. After doing eight miles, at Tortona I had a bullock shoe nail right through the

1. The town where the writer spent the night before crossing the Simplon Pass.

2. The magnificent view obtained from the Simplon Kulm Hotel, at the absolute summit of the Pass. The road can be seen first of all on the right, then far below in the middle distance. Some idea of the immensity of this picture can be gathered from the farm buildings seen in the right-hand corner.

3. The "corkscrew" road from Limone leading up to the mouth of the Col di Tenda Tunnel. The road is marked.

30 m.p.h. gait! Soon the abominable roads and appalling villages made me slow down, and the road was very difficult to find, people imagining I could lift the machine up flights of steps to bridges over the canal. After some patience, I eventually got through Mouselice Este to Leguagno, a quaint walled town, below the level of the River Adige, which is crossed by going up an inclined plane, parallel to the river. Mantova is a

back cover, tearing the tube in two places. This had to be repaired in a dust storm. The dust was terrible—the way very difficult to find. The road for the whole distance was nothing but longitudinal ruts, close together and deep, so that steering became almost impossible. In places I was only able to ride on the 2ft. wide path at the roadside, bounded by periodical stones on one side and a ditch on the other. One collision with a boundary stone stripped

From the Channel to the Adriatic and Mediterranean and Back.—the luggage off the footboard; there were several very narrow squeaks of going into culverts, which I did not see till on top of them. Every bit of luggage I had on the machine fell off several times. When I got to Turin, the city was alive with Exhibition visitors, and the Via Roma gaily decorated with bunting and garlands, and trams everywhere. Eighty-four miles.

Thursday, July 13th.—Before starting I visited the Borgo motor cycle factory. The Borgo machines are wonderful, but I have no space to describe them. I had discussed the road over the Col di Tenda with several Turin motor cyclists, and they, without exception, said it was impossible to motor cycle through the tunnel owing to the mud. In fact, one of them had essayed it a fortnight earlier, and had to retire with a mud bath. They strongly advised me to go round it by train, but I was not to be deterred.

Passing through Racconigi, where the Italian Royal Family were in residence, well guarded by sentries, and getting on to Saluzzo, I ran out of petrol. Fortunately, I had only a mile downhill to go to the nearest village. Then it was more of the chemist shop product, costing 4 francs 20 for six litres. Passing through Cuneo—a city on a hill, where is an electric trackless motor 'bus service with overhead wire connection—the road becomes very twisty, winding up the magnificent Vermentagna valley, with its rocky scenery. The carburetter went on strike again, but though I could not exceed twenty-two miles per hour downhill it took me to my night's stopping-place. A landslide caused me some trouble to negotiate, as well as some very narrow, cobbled streets with dangerous, deep gutters running across at intervals. As the horn bulb had perished, I had to use the exhaust whistle, and every time I raised the exhaust a low bang would take place in the whistle, scaring the women and children, who went rushing into their doorways pell mell. I stopped at the Hotel d'Europe, Limone, in a gloriously pretty spot, where I was most comfortable. If anyone is looking out for an ideal honeymooning place, here it is. Eighty-nine miles.

Through the Famous Tunnel. No Photographing Allowed.

Friday, July 14th.—Leaving at eight o'clock, I had a wonderful corkscrew ride up the mountain, passing two three-mule waggons on two of the hairpins, but doing a non-stop to the mysterious tunnel. William le Queux describes this road thus: ". . . One approaches what appears to be an impassable barrier—the high blue Maritime Alps. Gradually it rises, through remote Alpine villages, higher and higher, then with sharp corkscrew turns, still ascends . . . wilder becomes this treeless scenery, while

the view, looking back, becomes superb. . . Then suddenly the road ends, and you find yourself face to face with a tunnel . . . two miles long . . . deadly cold within." My attempt to photograph the entrance was at once stopped owing to the proximity of an Italian fort. Lighting the lamp, and on the low gear, I entered the blackness, wondering what was in store. The sensation was weird—the banging of the engine reverberating up and down—slithering about (the Kempshalls prevented me actually parting from my machine) in the mud, I went on, on into the narrow blackness. Then after about a mile I saw far away a faint pinhole of light, which gradually grew larger and larger, till at last I emerged, having successfully negotiated the dreaded tunnel. Here I attempted another photograph, with similar results, and I was thankful I was not in Germany. From the tunnel exit the view of the road was extraordinary, as it

This picture gives a good idea of the road near the foot of the Simplon Pass on the Italian side. A "refuge" can be seen by the bridge.

wriggled, in countless hairpins, right down the face of the mountain. The scenery through the gorge defies description. On over the rough road to Cannes, and then along that wonderful road (the Corniche d'Or) round the Esterel Mountains, with the blue Mediterranean always on one's left, to St. Raphael. Sixty-five miles of Alps, followed by the twisting Esterel road, causes a great strain on the eyes and nerves, especially at Bank Holiday time, when numerous cars are about. I found the best way to take the hairpins was: "Machine out and body in." I only had one stop for overheating (due to the carburetter being on strike) in all this mountaineering,

From the Channel to the Adriatic and Mediterranean and Back.—and it was hot, too, for the low gear! Day's run, 113 miles.

Cosmopolitan Marseilles.

Saturday, July 15th.—Leaving St. Raphael for Fréjus, I took the wrong road, and found myself travelling along the magnificent cork and pine-tree forest straight back to Cannes, until I noticed a kilometre post. I did not meet a soul on this road, nor did I regret my mistake, as the road was so beautiful through the sweet-scented forest. I reached Marseilles early in the afternoon. The road in places, as is common all over France, was entirely broken away in lumps, but good for the most part; very narrow villages, with abrupt corners and steep hills. The *pavé* at Marseilles was excellent, and is kept in very good repair. Day's run, ninety-eight miles.

Sunday and Monday, July 16th and 17th, I spent at Marseilles, which had given itself up to the Festival of the Republic. Do not miss seeing Notre Dame de la Garde. Marseilles is chiefly remarkable for smells, mosquitoes, long curving horns on the horses' collars, carters' cracking whips, trams, and ships. Also one sees representatives of every nation under the sun, clad in their native garb, which makes the effect very picturesque. I noticed two motor lorries at the docks, flat belt driven to the counter-shaft, and then chains to back wheels. Talking of chains, my low gear and back wheel driving chains were the original ones I had with machine, having done 2,279 miles with a sidecar and passenger and 4,543 solo before I started on this tour. How does this compare with belts? The high gear chain had been replaced before commencing the tour, and as the pitch of the teeth and rollers did not agree, the rollers constantly broke. The other chains needed no attention beyond greasing.

Tuesday, July 18th.—10.30 a.m. saw me once more awheel on the blinding white roads of Southern France, through Avignon (a sleepy old place, where the old Popes' palace is used at present as a barracks), along the banks of the Rhône, over the typical bridges to Orange with its famous Roman arch. I overtook the first G.B. car I had seen since leaving Abbeville, near Valence, and I finished up in the darkness at 9.30 at Vienne, which looked very pretty, with its twinkling lights across the river. Owing to the carburettor sulking, I could not exceed 22 m.p.h. from Valence, but I managed to reach my destination for the night, having run 193½ miles from Marseilles.

Misfiring and its Cause.

Wednesday, July 19th.—Leaving the Hotel de la Poste, I traversed a very rough, hilly road for some miles, and then stopped to grease chains and clean up a little. After this the machine kept misfiring, and though I kept altering the nut on the float, as the carburation was at fault, this went on for many miles. Now heavy rain descended, and I bumped through Lyon in a downpour, still misfiring. Finding the main road again at Villefranche, and the rain having cleared off a little, I paused to cure the misfiring. Will you believe me? In cleaning up in the morning I had pushed the half-compression lever down, and, forgetting it, had driven nearly forty miles on half-compression, hence misfiring unless I had full throttle! The symptoms, being so similar to those

of previous carburettor troubles, had deceived me. I ran on merrily through Mâcon, Tournus, and Châlon-sur-Saône, where the country becomes very hilly and pretty, with fields and hedges as in England. It is the edge of the Côte d'Or. There is a very pretty view of a chalet perched high up above the village as one drops down into La Rochefort, and again on the climb up the other side. Just as I reached Saulieu my back tyre went flat, and as it was now dusk I stopped at the Hôtel de la Poste for the night. 151½ miles to-day.

More Haste the Worse Speed.

Thursday, July 20th.—Rising at six o'clock, to make up for lost time, I mended the leak and got away over the hot and dusty road. At Etampes, where the road was awful, a bolt came out of the high gear chain, and I did a rapid repair, surrounded by a gaping crowd. I had great difficulty in finding my way. Darkness came on; I had no carbide, hence no light; nothing but cross roads, and no signposts and no moon. After roaming about and almost deciding to sleep in a cornfield, I happened on a railway crossing keeper. He gave me full directions, which at last brought me to Chartres at 10.45, after I had gone no less than thirty-five miles out of my way. Day's run, 191 miles.

The Final Burst to Cherbourg.

Friday, July 21st.—I had now 192 miles to do before reaching Cherbourg, so leaving the Hôtel du Grand Monarque at 6.40, I had only done nine miles, when I ran out of petrol. As the engine was still hot, I managed to get half a litre of paraffin, on which I ran to the next village, nine miles away, and filled up with *essence*. The roads were excellent through Normandy, the only rough *pavé* being through Verneuil. After the usual interview with the back tyre, I got going fast to make up time, through Laigle, Argentan, and Falaise, along the deadly straight road to Caen, thence with the road stretching in view for miles ahead to Bayeux and the undulating road to Valognes, finishing up with a long drop down to Cherbourg, which I reached at 6.45. Putting the machine (fare 4s.) on board the *South-Western* with the aid of half a dozen porters who would help, I had a glorious dinner at the Café du Grand Balcon, and sailed at 1 a.m. for England. Day's run, 192 miles.

I had succeeded in getting across France from sea to sea—728 miles—in four days, heavily laden, and with an engine which had not been touched (save for the new exhaust valve slipped in on the third day of the tour) since leaving England. A week's stay at Bournemouth, and then the 145 mile run home (the Hampshire roads were very loose owing to the drought) completed the tour of 2,595 miles. For the machine which carried me so well I have nothing but praise, and it speaks well for the strength of the frame that no tubes broke, or any part save the carrier and mudguard stays, which were partly supporting the carrier.

NEXT WEEK!

MOTORCYCLE Buyers' Guide

Containing a complete specification
and prices of all 1912 models.

She looks good and she makes good because - she's an **N.S.U.**

There is a masterliness about the designs of the N.S.U. mounts that knowing eyes never fail to appreciate. A compactness without crowding of details, a thoroughness which omits nothing, and a gracefulness achieved so simply, are characteristics, evolved only after long experience and careful observation, of the N.S.U.

Again, you will find that, in general utility, economy and wearing qualities, the N.S.U. works out well on the right side of the owner's balance sheet every time. Let us supply you with technical and other information regarding these most reliable motor cycles.

FOUR 1912 N.S.U. MODELS

2 H.P. SINGLE CYL. 3 H.P. TWIN CYL. 3½ H.P. SINGLE CYL.
6 H.P. TWIN CYL. ——— UNRIVALLED FOR SIDECAR WORK.

ALL models fitted with LOOP FRAME, special spring forks, spring frame, automatic carburetter, handlebar control, special oil and petrol tanks, two powerful brakes, etc. Our famous two-speed gear and free engine apparatus can be fitted if required.

TESTIMONIAL

October 23rd, 1911

Dear Sirs,

"In your advertisement I note you say 'First in 1903 etc.,' well I own a 1903 SINGER bike (No. 1084) and the engine is in fine condition. One or two alterations I have made such as lowering the seat, fitting longer handle-bars, and the old bike carries me everywhere. I ride nearly every day and in the coldest weather the machine will start with ease and once warm will start at a walking pace in 5 yards. I have ridden a lot this Summer and the machine has brought me home every time—no pushing to nearest station. I have never had engine trouble on a journey, the power of this engine is wonderful. It tackled Lansdowne Hill, Bath, last Summer at 20 miles per hour, tested by speedometer on a 1911 3½ h.p. machine of another make, which belongs to a friend of mine, and he admitted he could not pass me. We both started on the hill itself, on this same occasion another 1911 3½ h.p. machine would not go up without the pedals. We three had ridden nearly 50 miles before tackling the hill at a very decent pace.

Wishing your firm every success,
Yours faithfully. "B.M."

Satisfaction is guaranteed to

ALCYON RECORDS AT BROOKLANDS.

Six Hours' and several other Class A Records Broken by N. D. Slatter.

THE Alcyon motor cycle, which made its *début* in England this year, has just finished a season in which its performances have made its name. First and foremost, we must remind our readers of its excellent behaviour in the Six Days' Trials, and, secondly, we have to relate how in the hands of N. D. Slatter it beat the six hour and other Class A records on Tuesday last week. The machine was a standard 2 h.p. Alcyon fitted with an extra large tank, C.A.P. carburetter, Bosch magneto, and Hutchinson tyres, and was running on Shell spirit. The time-keeper, Mr. F. Straight, started Slatter just after 10 a.m.

The morning was fine and cold, but a strong south-westerly half gale prevented any startling times being made. The little machine, however, began by reeling off the laps at a 43 m.p.h. average, and ran most consistently. A stop was made at seventy-six miles for replenishments, the tanks being filled in 1m. 20s. At the end of the next lap, however, Slatter had to pull up to replace the contact-breaker cover of his magneto, which came adrift. In the first hour 43 miles 850 yards were covered. At the end of the forty-seventh lap a stop was made to tighten the carburetter union nut and to take in a further supply of petrol and oil, and at the end of the next to file down a stretched valve. The distance covered in the two hours constituted a record—84 miles 1,575 yards—beating C. S. Franklin, who on a 257 c.c. M.R. covered 50 miles 1,285 yards, on June 9th last. Slatter also gained the 100 miles record for Class A, time 2h. 21m. 45 $\frac{1}{5}$ s.,

N. D. Slatter, who, riding a 2 h.p. Alcyon, captured several Class A records at Brooklands last week.

N. D. Slatter stops during his record ride to replenish the petrol and oil tank.

beating Yates on a 198 c.c. Humber, time 3h. 18m. 50 $\frac{4}{5}$ s., October 8th, 1910, while the three hours record also fell to the Alcyon, 127 miles 126 yards, beating C. S. Franklin, who in the time covered 77 miles 472 yards. Slatter continued to average about 40 m.p.h., but his fastest lap, his forty-ninth, was

45.71 Miles an Hour.

Later in the afternoon misfiring set in, and it was found that the exhaust valve had again stretched. The four hours distance was 163 miles 1,622 yards, while in five hours 196 miles 1,011 yards had been covered.

The wind by now had become very strong, the sky clouded over, and a cold and heavy rainstorm came on, which spoilt the gripping powers of Slatter's belt. At the seventy-fifth lap he changed his belt, and again at the seventy-sixth he did likewise. The belt slip was apparently incurable, and the average speed was now reduced to twenty-eight miles an hour. The record, however, was safe, but just before the six hours were up the belt broke in the railway straight, and the ride was ended.

Two hundred miles were covered in 5h. 5m. 12 $\frac{4}{5}$ s., and at the conclusion of the ride 223 miles 1,494 yards had been accomplished, easily beating Franklin, whose distance was 159 miles 1,055 yards, on June 9th this year.

To accomplish an average speed of thirty-nine and a half miles an hour for two hundred miles at Brooklands on a machine fitted with such a small engine as the Alcyon is a splendid performance, and one of which Mr. G. N. Higgs, the agent for these machines, may well be proud.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Good Performance of a 2½ h.p. Lightweight.

[6023.]—On Saturday, October 28th, I witnessed an ordinary 2½ h.p. single-speed A.J.S. lightweight climb (without pedal assistance) the famous Griffin Hill, Gresford, North Wales. This hill is well known to Chester district motor cyclists as a good test, the gradient being at least 1 in 6, and is declared by some to be 1 in 4, there are also some very sharp corners. The machine was taken from stock at the North Wales Motor Exchange, Rhosdda, Wrexham, and ridden with a view to purchase.

(REV.) D. T. SILIAN EVANS.

Hill-climbing in Cheshire.

[6024.]—Permit me, as a regular reader of *The Motor Cycle*, to ask if many of your readers ever get into the rough parts of Cheshire. I hear it said on all sides that the Cheshire roads are grand bowling roads, but I may suggest that any motor cyclist desirous of testing the climbing powers of his machine should try the roads around Macclesfield.

If he would take the road from the last-named town to Wincle, Wildboardclough, Swythamley, and Macclesfield Forest, or through Quarford to Buxton, and return by way of Chapel-en-le-Frith, Kettleshulme, and Rainow, he will land in Macclesfield after a very exciting time, and I think he will find roads rough enough to last him a lifetime.

I ride a 3½ h.p. Bradbury, but a single-cylinder machine is hardly enough, to my mind, for this district.

Over these roads, any machine, no matter what make, will have to struggle hard to surmount most of the hills.

I should like to hear of any riders climbing these Cheshire hills.

A. BURGESS.

Hints on Dismantling the N.S.U. Gear.

[6025.]—In one of your October issues there appeared a letter under the above heading, which I feel, if left unanswered, might have the effect of frightening amateurs like myself, with but little mechanical knowledge.

Two years ago I bought a 6 h.p. N.S.U., for use with sidecar. This was my first machine, and I knew absolutely nothing about motor cycles. I was warned to leave the gear alone, in the sense, that is, of trying to take it to pieces to see how it worked. I have followed that advice. I have never even oiled it through the little screw provided for the purpose, but I have been careful to see that the engine always had plenty of oil, and I concluded that as long as the outward appearance of the gear showed that oil was coming through, all was well. I admit I have not been in for competitions, extraordinary hill-climbing, or anything of that sort, but I have covered over 8,000 miles by Cowey, of which the greater part has been with my wife and two young children in the sidecar, and a by no means small proportion has been town riding, when the gear is constantly in use. I have had no trouble with the gear whatsoever, partly no doubt due to the fact that I adhere rigidly to the makers' advice never to leave the machine standing in the road or the garage with the low gear in, when the spring is compressed, but always turn the handle back to the "high," when the spring is relieved. I hesitate to differ from an expert such as the writer of the letter under reply, but I can truthfully say that I have not found any of the five faults, which Mr. Philips enumerates, to exist. The best "hint on dismantling the gear" that I can give is *Punch's*: "Don't."

N.S.U.

Water in Petrol Tins.

[6026.]—I should like to recount a recent experience with my 6 h.p. Zenith. Running short of petrol, I called at a large garage and asked for a gallon of Shell. My tank was duly filled, and after paying 1s. 3d. I departed. Taking a hill a hundred yards or so from the said garage, my machine misfired once or twice and then stopped altogether. Badly sooted plugs thought I, so, of course, I immediately cleaned them and then confidently pushed the machine to start it, but for some reason it would not start. I then put a spare Bosch plug in, but no use—it would not start. I examined carburetter, it was in perfect order. I then cleaned carbon brushes, and did everything I could, even to injecting, although the engine was hot. As it would not even fire the "petrol" I injected, I naturally concluded something was seriously amiss with the magneto. I had already spent an hour trying to put machine right, and as I was in a hurry, I decided to go back to the garage where I purchased the petrol and see if there was anyone capable of diagnosing what was the matter. I was told what was wrong immediately I entered the garage. In calm tones I was informed that someone had put water in my tank by mistake. I think that if anything is more than idiotic, it is to put water in a spirit can, and then place that can among the other cans that do contain spirit, as was done in this case. I write this to warn readers that it is not always the farm labourer who has turned his cowshed into a garage by some country roadside who is to be carefully watched, but many garages in towns.

SYDNEY R. AXFORD.

A Conversion—Trembler Coil to Plain.

[6027.]—A friend of mine has converted his trembler coil to a plain coil in the following manner: Positive of accumulator to positive of coil. Negative of accumulator to the old contact terminal of coil. Plug to B (on coil) as usual. Wire from trembler screw and bridge to handle-bar switch, and frame wire from screw which previously held the trembler blade (now entirely removed) to contact breaker (an ordinary make and break). This has been converted over six months and has run over 1,000 miles. My friend

Manner of connecting up a trembler coil to work as a plain coil.

says he has noticed a great improvement in the running. Another point worth noticing is that the coil can now be run on two volts, using one cell of the accumulator at a time—previously it required four volts. As I have frequently seen it stated that a trembler coil cannot be used as a plain coil, this seems to be of unusual interest.

E. E. SMITH.

Is your Magneto a British **SIMMS** ? Are the Plugs you use British **SIMMS** ?

because if they are not you are not getting the highest possible service from your engine. This may sound a very bold statement, but it is, nevertheless, a fact,

SIMMS

ALL-BRITISH MAGNETOS

are not affected by vibration, which is the cause of a big percentage of ignition troubles at this season of the year when roads are heavy and rutty—this is a point worth consideration.

Mr. James Murton's 2,157 miles in 6 days was accomplished on a machine fitted with the Simms Ignition. He writes: "Had not the slightest trouble with magneto, and it was not touched the whole of the journey."

Let us send full particulars at once.

By the bye, we have a unique service for **Magneto Repairs**, overhauling, repairing, and dispatching same **within 24 hours**. Can we be of service to you?

We shall be at Olympia Motor Show, Stand 251, Gallery.

The Track at New Brighton.

(6028.)—Your correspondent "Limelight," obviously without the courage of his convictions as he signs with a *nom-de-plume*, makes some absurd remarks regarding the above track. I think I need only show his crass ignorance of the subject on which he presumes to write by pointing to his comparison of New Brighton Track (a flat one with banked ends) with that of American "saucer" tracks.

I should be only too pleased to meet and fix up matches with "Limelight," but presume he will not come out of his shell.

It is hoped that if your correspondent answers this he will at least have the courage to put his name to his letter, otherwise I shall let the subject drop. E. F. BAXTER.

Cost of Running a 3½ h.p. Motor Cycle.

(6029.)—With reference to letter 6015 regarding the above heading, perhaps the following may be of use.

3½ h.p. Humber and sidecar, May to October (inclusive); mileage 4,000.

	£	s.	d.
Shell spirit, 45 gallons, at 1s. 0½d. ...	2	6	10
Vacuum A oil, 8 gallons, at 4s. 6d. ...	1	16	0
*Tyres, belts, and repairs ...	16	3	4

£20 6 2

*Including one non-skid band, one steel-studded cover, one suit new clothing, four rubber belts, two inner tubes, and two repair bills and one repair bill for collision.

Total inclusive cost per running mile, 1.21d. (say 1½d.).

C. A. M. HOWARD (Capt).

[Deducting the clothing and the repair bill due to a collision, the cost would be reduced to some extent. These items should not be included in running costs.—ED.]

Will the Ultra-lightweight Return?

(6030.)—It is very interesting to see the way in which exploded ideas are resuscitated in these enlightened days. There were numerous attempts between five and ten years ago to make the ultra-lightweight by means of a so-called "conversion set" to fit a push cycle. Every attempt to make a complete roadster motor bicycle at under £30 and 75 lbs. has failed, dismally—the principal reasons being that it is impossible to turn out a comfortable and efficient machine of good workmanship and hill-climbing capabilities at this price; also these very light machines hold the road very badly, even at ordinary low speeds, and the flimsy frame seems incapable of absorbing any road or engine vibration.

The 2½ h.p. New Hudson three-speeder started life at 110 lbs. "lightweight," but with the numerous additions that have been made to increase the efficiency and stability of the machine and the rider's comfort, the weight is now nearer 140 lbs., and there is not the slightest doubt that the machine has been improved by this, especially the 12 lbs. added weight of the Armstrong three-speed gear.

THE NEW HUDSON CYCLE CO., LTD.

—ROY W. WALKER.

The Trade and the T.T.

(6031.)—The trade have ample justification for refusing to continue to countenance an event whose title "T.T." was always a flagrant misnomer. Mr. H. W. Fortune's tribute to the A.C.U. is one which everyone recognises. On the other hand, few will share his alarm at the manufacturers' abandonment of a race which, if transferred to Brooklands or Benares, makes no difference.

Mr. Fortune might well exclaim, "I have here a machine—a T.T. machine—that has averaged its thirty miles per hour. Its valves have kept in excellent condition. It has needed no overhaul after even 12,000 miles. It is still sound and strong enough to resist Scottish moorland roads."

But could he in truth continue, "I have here a machine—a T.T. machine. To start it, I have neither to pedal nor to vault into my seat, nor get going by the help of a stand; a machine that turns in an ordinary roadway without dismounting, that climbs any hill without a rush, and with sidecar attached will take any slope from standing start; a machine that enables me to reach my destination respectably

attired, without the disguise of overalls, without gaiters for my boots, and without cumbersome strappings for the carriage of spare tube, belt, and the like; a machine that in traffic never puts my life in jeopardy, never causes me the smallest inconvenience in negotiating a busy market town; a machine that is in short no less easy and handy to start and operate than a car?"

Until such a type is standardised, it will be prudent not to condemn the makers hastily. The way has been paved enough for speed. With less clamour for its repetition, and more for exhibition of some added comfort and convenience, a new era of construction will steadily arrive that will do far more to popularise the motor cycle than all the racing events combined. The coveted machine as represented in the average T.T. model is one that only enthusiasts will tolerate, and one that gives no promise of any permanent career.

ARTHUR W. WALL.

(6032.)—Being an interested spectator of the T.T. race, and one who has had great pleasure in witnessing the famous road race during the past three years, I read with regret the attitude some manufacturers are showing toward this coveted trophy. Surely hundreds of motor cyclists who have been attracted by the prospect of sport attached to the open road race will lack the enthusiasm to go to Brooklands where the skilful rider and touring type of machine are certainly less likely to be required. You would interest the motor cycling world if you started a plebiscite on the lines you did in regard to the day of publication of *The Motor Cycle*. Who votes for Brooklands? Who for the open road? It is a pity that financially the race should have been dependent upon the trade. Why do not the promoters encourage a larger entry by reducing the entrance fee? Then reduce the entrants by eliminating tests that need not take up as much time as is now devoted to practising. But perhaps the novelty has worn off. Motor cycles run like chronometers. And the incidental excitement has waned. I remain a most interested reader.

FRANCIS C. MASON.

(6033.)—I have read with interest, and not a little disappointment, your article on the decision with regard to the T.T. arrived at by the Manufacturers' Union.

Though I have never had the good luck actually to witness the race, I can claim to have been as much a spectator, through the medium of your excellent paper, as some of the onlookers who were there at the time.

I am convinced that a great number of motor cyclists decide on their next machine according to the T.T. results, and for this reason alone, apart from the sporting side of

Wm. Hughes Butterfield on his 1912 pattern 2½ h.p. two-stroke single-cylinder Baby-Levis. The exceptionally low frame will be noted.

the race, I think it would be a great pity if it were allowed to die out.

I do not intend, however, to dwell on the sentimental side of their decision or the pros and cons of their complaints, but rather to suggest a means of surmounting this extremely artificial obstacle.

Now, sir, I put forth this plan, not with the conviction that it is bound to succeed—I do not even know if the idea is feasible, for I am not a county magistrate, nor am I an A.C.U. councillor—but I submit it as a method, that your readers are free to censure or to propagate, as the basis of a wider scheme, as the spirit moves them.

I understand that, in the course of the week before the race actually takes place, the competitors are allowed to practise in the early morning, and this, apparently, without causing the slightest annoyance to the inhabitants.

Now, might not this fact be made use of, and might not leave be obtained to hold the races in some scarcely-populated county in the South of England (such as Devonshire or Cornwall), and, moreover, in the early morning?

Personally, I see no reason why so much time should be allowed for practising; surely two or three days ought to be enough; besides, the course being in England, there would be nothing to prevent the competitors from acquainting themselves thoroughly with the course at an ordinary touring speed.

I think the idea is worthy of consideration, and might give rise to a more feasible plan.

I think it would be extremely tame if the race were to take place at Brooklands; the same sort of exhibition can be seen equally well once a month or so.

H. A. BUSK.

[To legalise the race in England, a special Act of Parliament would have to be passed. We do not think that such an Act would be considered for one moment in this country.

—ED.]

Up Edge Hill on a Single-gear Sidcar.

[6034.]—In reply to W. G. Bower [5993], I should be pleased, if there are any Zenith-Gradua riders in Coventry or district, if he would ask them to run over to Edge Hill and show how easy it is to get up with a sidcar and passenger, the weight to be within a few pounds of 6 cwt. Personally I can make it convenient to run over any time, and, if any Zenith-Gradua rider succeeds, I should be very pleased to give him every credit for doing so.

W. BRANDISH.

Analysis of Carbon Deposits.

[6035.]—I was interested in reading letter 5997, by D. R. Edwards-Ker, giving an analysis of deposit removed from his cylinder. From the letter it would appear that there is very little road dust in the deposit, but the editor points out that the letter was written from Kent, and suggests that tarred roads may account for the absence of road dust. Although there is comparatively little dust on tarred roads, what there is consists of tar which has been worn off the road, and this contains a large proportion of carbon in combination, which when heated in the cylinder would be liberated, and so form a deposit which would consist chiefly of carbon. It would be interesting to compare analyses of deposits taken from machines ridden over ordinary gravelled roads, and see if the proportion of silicates and lime was materially increased.

A. J. DREW.

Wear of Big End Bearings.

[6036.]—Referring to Mr. Kennedy's letter in the issue of October 26th, I beg to differ from his remarks. He writes, "I have a 3½ h.p. single of well-known make which has now done 4,400 miles, and the third big end bush is now audibly worn, the average life of each bush being roughly 1,466 miles." Something is very much wrong with his engine for so small a mileage. Does he oil his machine well, say every ten miles? Does the engine knock excessively? Has the best phosphor bronze been used for the bush metal? Is the crank pin defaced, bent, or not set true?

I have had a similar experience with a bent pin. On the other hand, I have had single-cylinder 3½ h.p. engines down when they have done between 10,000 and 12,000 miles, and the big end has only been slightly worn. Only recently I had a 1909 T.T. Triumph engine down which had covered 9,000 miles, the bushes of which were in excellent condition and looked good for another 5,000 miles. This proves that Mr. Kennedy is wrong in saying that the average life of a big end bush in a T.T. single only does between 4,000 and 5,000 miles.

LEONARD B. HENDERSON.

Rear Springing.

[6037.]—Re "Ixion's" article on "Rear Springing," I can assure you that I have been riding a spring frame (not a spring saddle, like most of the so-called spring frame machines) for the last six months, and have never ridden a more comfortable machine, and I have had considerable experience in motor cycling. The machine I refer to is the "P.V." spring frame (3½ h.p. Peugeot engine), and I shall be very pleased to show "Ixion" at any time a real rear sprung machine. I have no interest in the machine except that of a satisfied owner.

P. F. BUTLER.

Stands as Nail Catchers.

[6038.]—As the writer of the letter that lured "Never Again" to his fall, I am naturally gratified to read Mr. Hughes's letter [No. 5984]. There is no danger at all if the stand be properly adjusted. I am still running with a small clearance like Mr. Hughes, and shall go on like him. If "Never Again" does not like the stand as a nail-catcher, let him adjust a piece of copper wire above his wheels, of such a gauge that it will carry away if there is any fouling.

AB 668.

Silence and Silencers.

[6039.]—*Apropos* of your leader on Silence and Silencers, it may be of interest to describe an experimental silencer I had fitted in 1904. Under full power, running fast, it was very silent, ditto at low speeds, running light, but it was noisy when accelerating from slow on full throttle. As shortly afterwards I took to four wheels, I did not carry the experiment further.

At that time I was doing blow pipe work and needed a quiet, but powerful jet, and, in a certain book, I read that the only way to secure this was by making a smooth cylindrical jet of length 15 to 20 diameters. In actual work, I found that with a steady gas pressure behind I obtained a powerful, yet silent, flame. The idea came to me to try this on the silencer of a motor cycle. The normal pattern was a cylinder about 5in. diameter and 8in. long, the exhaust entering radially about 2in. from one end of the cylindrical portion, the gases passing through a series of baffle plates. We left the exhaust pipe and cylindrical portion, but ripped out the ends and the inside. We then made two end plates

End view and section of the silencer described by PS 7.

distinctly substantial. To one we fitted about twenty-five ½in. tubes 6in. long, perpendicular to the plane of the plate. The other end plate was solid. A single long bolt and nut held the two plates with asbestos washers against the ends of the cylindrical portion, that containing the tubes being nearest the exhaust entry. I append a rough sketch to make details quite plain.

This silencer was most easy to clean out. All one had to do was to take off the one nut and the whole parts came adrift. There was also no question about its efficiency. I had a 1904 76 x 76 mm. engine (automatic inlet), and 26in. wheels. With a 5 to 1 gear it took the first London-Edinburgh without any pedalling, except on Alconbury Hill, struck in the dark, and on 4½ to 1 it took me up Reigate Hill unaided. The old brigade of the Motor Cycling Club knew well my R. and P. I have it still, and on the tenth anniversary of the Land's End Run and the International Championship of the M.C.C. I propose to turn out and show I have not entirely forgotten how to use a two-wheeler!

Part of this letter is a little personal, but the point is plain. By chance I hit on a plan which may commend itself to further investigation by Brooklands speed mechanics.

PS 7.

Overheating.

[6040].—I am inclined to think that the mechanical conditions have as much to do with this as the chemical conditions (mixture). I understand you to indicate this in your editorial note to letter No. 5987. We all know how hot a pump will get if there is any obstruction in the connection. It is the compression that does it. When an engine slows down on a hill there is more obstruction (load) against the explosion, and consequently, as it seems to me, more heat. Change over to the low gear (I ride a machine with P. and M. gear) and the engine is relieved at once, though if one drove hard on full throttle on the low gear the engine would overheat from another cause. AB 668.

[6041].—Mr. B. Starks Field's letter [No. 5987] reads like sound logic and close reasoning, but it is not. The logic in your footnote is very much better where you say, "bad running always makes the engine hotter, hence it causes overheating."

When the mixture is perfect in every way, that is, properly proportioned and properly mixed, then the maximum explosion takes place, or, in other words, the mixture reaches the maximum temperature in the minimum time. This explosion is so quick that it takes place quite at the top of the stroke, so the piston gets the benefit of the very high pressure quite early in the stroke. As soon as combustion is completed the gases begin to cool, due to expansion inside the cylinder, and when the end of the stroke is reached the gases are comparatively cool and the pressure low. The average temperature throughout the stroke may therefore be lower than if the mixture had been a little faulty with the resultant slow explosion and smaller power. But this is not all, for, as you are taking advantage of all the power the petrol will give in that particular engine, you are not using so much of it, as you find that you go fast enough with the throttle almost closed.

If the mixture be weak the explosion will be slow; often it is so slow that even with the spark fully advanced maximum pressure is not reached till the piston is well down the cylinder and combustion goes on right to the bottom of the stroke and into the silencer. In extreme cases the gas that remains in the cylinder is so hot that when the suction stroke begins it ignites the incoming charge and pops back into the carburetter. When the mixture is weak therefore you run with the throttle full open, and the cylinder above the piston is full of flame during both explosion and exhaust stroke. Therefore the weak mixture overheats the cylinder.

If the mixture be too rich the slowness of the explosion seems not to be so marked, but the maximum explosion does not take place because the petrol does not get properly burnt. If the oxygen in the cylinder would burn a proportionate amount of petrol properly and leave the remainder alone it would not be so bad, but it tackles the lot as well as it can and only half burns it, thus producing a much more poisonous exhaust gas and much less power. As the power is less, you must open your throttle more to get the speed, and the large charges overheat the cylinder. Another peculiar thing about too rich a mixture seems to be that when the charge of oxygen meets more petrol than it knows how to manage, some of it sulk and will not do anything; the bulk of it half burns the petrol and the remainder burns it properly so that the exhaust gases may consist of half burnt petrol, properly burnt petrol, unburnt petrol, and free oxygen.

WILLIAM SCOTT AND SON.

[6042].—In your correspondence columns of the 26th ult., under the above heading, there seems to be some misunderstanding of the working of an internal combustion engine. There is only a small range of the correct mixture for a given load and of complete combustion, the latter depending on the intensity of the spark. If the amount of air is varied, the power, and therefore the speed, of the motor will fall off. This can be proved by any good and quick following tachometer.

I can regulate my correct mixture like this: Suppose the speedometer shows 30 m.p.h.; by opening the air lever I reduce the speed to, say, 28 m.p.h.; by closing the air lever I pass the maximum speed, and note the position when it shows 28 m.p.h. again. The middle position is the best for correct mixture and maximum power.

Overheating is due to incomplete combustion and burning of the gases when they leave the exhaust ports. I have found this confirmed by an interesting experiment, or rather accident, last year. In order to silence my machine more fully I had fitted a long pipe instead of the normal box in front of the motor. As the autogenous welding had not been done properly, this pipe broke, and I had the finest open exhaust there is on the market.

Riding home at night, I saw a blue flame shooting out of the pipe, which disappeared as soon as I gave more air and appeared again when still more air was given, the colour now being yellow-red. There were several long hills to be passed, and I could see the flames again whenever the machine slowed down, showing that the mixture was no longer correct.

How will an automatic carburetter behave? With my next "one lever" the first test will be to try the machine without exhaust pipe at night (not in town, of course), and whatever be the effect, I wish to have an additional air lever.

An automatic carburetter can only be right if set for one size of jet, as I believe. If the jet chokes up—or when a smaller jet is fitted—I have to open the throttle wider and, at the same time, close the air lever. How is this done in the "automatic"? R.R.

Large Twins v. T.T. Singles.

[6043].—Regarding above article by Mr. Mackenzie Cott, my experience of the big Matchless on the road may be interesting. It is absolutely fine; beautiful to steer, quiet as a lamb, with throttle shut one can glide through country lanes with ease, and when I open the throttle on the open road, well—I should like to meet the car owner who would take me on for a wager. My answer would be "Yes, sir. I shall be delighted to give you a good view of my Hutchinson back tyre." Joking apart, the 8 h.p. Matchless-Jap is a beautiful machine, so easy to handle, everything on the handle-bar. Hand-operated oil pump, throttle and air lever, exhaust lifter, magneto control and front brake—plenty to amuse oneself with. The best of these big twins is that one never runs all out with them, they are never fully extended, and have such a wonderful reserve of power. One eats mountains, and then with the high gear you tick along the level on a "whiff of gas" at a nice speed. I consider the big Matchless my ideal in motor cycling.

W. HARRY BASHALL.

A NEW DESIGN. Gloria sidecar attachment to be exhibited at Olympia. In an extension of the chassis at the back, a framework has been formed for a small touring trunk and a two-gallon tin of petrol.

SUMMARY OF CORRESPONDENCE.

LAMPS AND WINTER RIDING.—The makers of the Voltalite magneto generator, mentioned in letter 5988, write to warn readers not to use a cycle generator on a motor cycle. All the modifications suggested by Mr. Turner are carried out in the latest motor cycle Voltalite in a much more substantial form, so as to withstand vibration.

A Growing Firm.

R. S. Fox, M.A., A.I.A.E., has joined the staff of Markham and Prance, consulting engineers, Dudley House, Southampton Street, Strand, London, W.C.

Progress.

Anyone on the look-out for a good place to open in the motor business as repairs to motor cycles or cars should pay Glossop a visit. A correspondent advises us that at present there is only one garage there, and they are extremely busy.

1910-11 Balance Sheets.

The firm of J. Lucas, Ltd., have had an excellent year, and in their report and balance-sheet to August 31st, 1911, the directors recommend a dividend on the ordinary shares for six months at the rate of 15% per annum, making, with the interim dividend already paid, 10% per annum. The net profit for the year is, with the balance brought forward, £36,174 11s. 11d.

The Enfield Cycle Co. have had a successful year's trading, and the directors recommend payment of a dividend on the ordinary shares at the rate of 5% per annum. £2,000 is allotted to the reserve fund and £6,297 carried forward to next year's account. Since the formation of the company the 7% dividend on the preferential shares has been distributed half-yearly, and an average dividend of 7% has been paid on the ordinary shares. The total profit earned in fifteen years amounts to £169,570, or £44,600 more than the total amount of the paid-up capital.

A New Carrier.

A novel form of carrier has been produced by Mr. E. A. Wallbridge, of 31, Wood Street, Woolwich, and sold under

The Wallbridge motor cycle carrier, the sides of which as may be seen are all collapsible, or the whole case may be detached as shown above.

the name of O.A.I. It consists of an angle steel carrier made to fit almost any machine, in which lies a collapsible metal box. This box is made to form a kind of metal hand bag in its normal condition, but by an ingenious system of hinges it can be extended to carry a large amount of luggage or shut up quite flat to form a solid carrier, or the box can be detached from the carrier by a simple spring clip. The stays of the carrier sent us for inspection were formed of twisted strip metal, but we are told that the more usual form of tubular stays will be fitted in future.

Spring Belt Rim.

Mr. J. W. C. Basnett sends us the accompanying illustration of a belt pulley which he has invented and protected.

The flange B is slotted and prevented from revolving on the flange A by the studs D. The springs C force the two flanges together, but when the belt tension is increased or diminished as when raising

A new spring belt rim in which the inner flange is adapted to take up the slack of the belt when changing gear.

or lowering the gear by means of a variable pulley, the belt drops or rises in the rim and assists still further in the change of gear. Another advantage is that belt tension is kept constant. Mr. Basnett would be glad to hear of any manufacturer who would like to make the rim.

Armagh Enterprise.

Patrons of the firm of Messrs. J. J. Millar and Co., of Armagh, will learn with pleasure that its foreman mechanic

is now at the Triumph motor cycle works, Coventry, and will for some time be put through a course of thorough tuition by an expert in the repair department. It is essential that repairs should be properly executed and finished, and all riders of Triumph machines in Armagh who may require their machines putting in order for any special event will do well to bear in mind this wise move on the part of Messrs. Millar and Co.

Agents for the Ceylon M.C.C.

It is somewhat of a novelty for a club whose members reside abroad to appoint a home firm to act as its purchasing agents. The Ceylon Motor Cycle Club, an active body of over sixty members, which has done much towards popularising the sport in that island, has, we are told, just made arrangements with H. Taylor and Co., 21a, Store Street, W., to represent it in this country.

Douglas Depot Changes.

Gordon L. Fletcher, the well-known exponent of Douglas motor cycles, has been appointed manager of the London depot of Douglas Bros., at 338, Goswell Road, E.C. What Mr. Fletcher does not know about lightweight motor cycles is not worth knowing, so that riders of these machines who are not absolutely sure they are getting the best results from their engines, should call and consult this well-known expert rider.

Sidecar Frame Design.

The additional stay from sidecar to motor cycle which was mentioned on October 5th under the photograph of Mr. and Mrs. Jones with their motor bicycle and sidecar, is shown attached to one of the Garrard-Maxfield sprung wheel sidecars. These are all fitted with this special stay when the sidecar is intended for use with an additional front seat for a juvenile.

C. Pusterla (3 1/2 h.p. Triumph), winner of the Campionato Italiano road race over a course of 324 kilometres, winning the Bronze Statue presented by the Queen Mother. He was also second to finish in the motor cycle race at the end of last month held on the Brescia Circuit.

This Week's Business Getter.

What about that order we are expecting?

Have you FORGOTTEN US? If so, we have not forgotten you. We are still in hopes of getting it. Without hope man cannot live. We have on the STANDS at the Olympia Show, and for immediate delivery afterwards, models of all the best machines, comprising the following:

Premiers, Scotts, P. and M., Matchless, Bradbury, Douglas, Humber, J.A.P.-Bat, Clyno, Zenith, A.C. Tri-car, Morgan Run-about, and Indian.

Don't you want one of them; if so, you will have to be very handy and let us have your order. Besides these, we have continual deliveries of the same machines all through the year. Orders can be booked for any week in any month. Don't fancy you want one in May, as they will most likely be all sold before then; get on the JUMP NOW, there is no time like the present. You can buy them on Cash, Deferred, or Exchange terms; only, please be handy and let us have your orders. We do not like to lose anything, and we do not like to miss any orders, which will sure to be the case if you come along at Easter. Get them booked now, and you will be sure of them. We have over 300 Two-speed Gear Sidecar Machines purchased for next year's delivery. These are what the boys will want, and if you get your order placed now, you will not be disappointed later when the sun shines.

We are wishful to make terms with those gentlemen who have machines at present, and are looking out to exchange for one of next year's models, and who are prepared to send it along at once and fix up the contract for next year. By doing this they will get rid of the machine while it is in good condition, and get their order booked, and he fixed up re delivery. The matter is then off their mind, and they have no responsibility in regard to keeping the machine free from rust during the winter months. Take a tip from us, and send them along at once; it will pay you to fix up now.

What about that good Second-hand Machine that you are thinking about getting. Now is the time to get them cheap, as we wish to keep the stock as low as possible, so as to find room for the dozens of new machines that we have coming through between now and Christmas. Peruse the following list, and you will be sure to find something to suit you. If you don't see what you want, write us, as it is just possible that we shall have the very thing in, as we are getting them in daily from exchange deals and for sale on commission.

By the by, have you ever noticed the similarity between our advertisement, say, this week, and those of other firms a few weeks hence? One would think that somebody copied us. They do say that "Imitation is the highest form of flattery." However, we don't mind it in the least, feeling sure that the boys will twig it quite soon enough, and give credit where credit is due, and also give their orders to the firm who are UP AGAINST IT, and are out TO TREAT THEM WELL. If we cannot do well for you, no one else can, what with the largest stock in the entire world to go at, and the most up-to-date business system behind us. We can cut out the small man, and save you pounds on the fancy prices charged by the private Motor Cycle Broker, while no other firm or private individual will send you goods, the same as we do, for you to look at, and if you don't like them, let you send them back, and RETURN YOU THE MONEY IN FULL. This game places us FAR AHEAD OF ALL OTHER FIRMS. We are the largest advertising firm in the trade, but this alone would be of little avail. It is the originality of our system of business and straightforward dealings which does the trick, finds us customers and keeps 'em.

What more can you want? If you are not satisfied, you get your money back. If you ARE SATISFIED, all that we ask of you is to TELL YOUR FRIENDS, as we believe that this form of advertising is far ahead of any other, and very much cheaper.

We have now been chipping for over two years, week by week, and still have PLENTY more TO SAY. Our stock of ideas is still green. When these run dry, we will fall back upon the thousand and one satisfied customers that we have in all parts of the world to help us to add to our fame and reputation.

DON'T call round and ask your Local Agent WHAT HIS OPINION OF HITCHEN IS BEFORE YOU SEND YOUR ORDER. Don't ask the Club Critic what he thinks about us. It won't make "tuppence" difference what either one or the other of them think. You cannot be "had," as if you don't like what we send you, you are not compelled to keep it. Send it back WITHIN THREE DAYS, and the deal is off, and you have your MONEY BACK, and have a chance to have a packet with somebody else. Someone might say that Hitchen's cannot do it; if they do it, why don't other firms do it? The answer is, that we imitate no man, while others try to imitate us in this respect, but don't go the FULL HOG, they finish up with EXCHANGING your motor cycle or accessory. We, on the other hand, RETURN THE MONEY PAID IN FULL and ask no questions. Now, boys, what is it to be? Say the word, and it's done.

NEW 1911 MODELS.

P. and M., 1911, two-speed, just in	£56 10
BAT-J.A.P., 5 h.p.	£58 0
SCOTT, 1911, two-speed, just come in	£60 0

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I. Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II. York and Lancashire.

SECTION III. Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV. Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V. Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI. Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembrokeshire.

SECTION VII. Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII. Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX. Somerset, Devon, Dorset, and Cornwall.

SECTION X. Scotland.

SECTION XI. Ireland and Isle of Man.

THE Daily Mail

OFFICE IN FLEET ST.

is only a few yards from our building, where we are holding—

London's Largest Single Exhibit of Motor Cycles.

Visitors up for the Olympia Show should make a point of seeing this great display, and arrange now with us to exchange their present machines for the newest 1912 models delivered at the opening of the new season. We quote lowest prices none can beat, make largest and most liberal cash allowance, and give most complete guarantee, ensuring absolute satisfaction.

WAUGHOPES

9, SHOE LANE, FLEET ST., LONDON, E.C.

Telegrams: "Opifcer, London." Telephone: 5777, Holborn.

A LAND MARK TO HELP YOU TO FIND OUR SHOW.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear on the advertisement. Replies should be addressed, "N 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown person may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard this silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to each one by post.

The Olympia Show.

THIS, the second of our Show issues contains the annual Buyers' Guide, a feature which is of the greatest interest to motor cyclists, coming, as it does, on the eve of the opening of the Olympia Exhibition. Particulars of every machine which will be on show next week will be found in the Guide. In addition there are others which for various reasons will not be exhibited; this feature, therefore, forms not only a guide to the Show, but a complete list of motor cycles on the British market, excepting the lesser known locally-built machines.

Visitors to Olympia should pay particular attention to the variable gears; more of these devices will be in evidence than in previous years. A few methods of springing the rear wheel will be on view; these should be carefully examined as a development of the future. One or two examples of a laudable desire to throw off the trammels of the usual splash method of lubrication will be in evidence as a sign of what may be eventually standardised.

The growing tendency towards the single pedal or kick starting mechanism, particularly in connection with variably geared machines, will be very noticeable; of course, it is not a novelty, but many more makers have adopted it for 1912 than previously. Among accessories the all-round improvement in adjustability of carburettors, both with regard to the regulation of air and petrol and general accessibility and the further protection of magnetos, should be especially noted. Visitors to Olympia who make a hurried survey are apt to miss the Gallery. We recommend our readers to make sure they see these exhibits, which will be composed almost wholly of accessories, among which will be the new carburettors and magnetos

A.C.U. 1912 Programme.

IN framing its 1912 competition programme, the A.C.U. has had two points to consider—the support of the trade and the avoidance of interfering with provincial club events. Consequently the 1912 programme referred to last week has been considerably curtailed. The Quarterly Trials, it will be noticed, have developed into two one-day events in the spring and autumn; the inter-club championship has been dropped, and no mention is made of the annual race meeting.

No one will regret the abandonment of the inter-club championship. It is but a recently established event, which undeniably clashed with a most important inter-club function, which was actually the inter-club championship. We refer, of course, to the M.C.C. inter-team trial, founded seven years ago, and always well supported. The annual race meeting, however, should not be abandoned. Surely the Union does not intend to give up its one and only track event, which has been run uninterruptedly for nine years, and in which perpetual challenge cups, given nine years ago, are competed for.

The meeting was first run by the A.C.G.B.I. under N.C.U. rules, and dates even prior to the time when the N.C.U. gave the control of the sport and pastime to the A.C.G.B.I. (now the R.A.C.), which in turn delegated it to the then A.C.C.

Lastly, reference must be made to the Six Days' Trial. All that is known about this event is that it is to be run from a centre. This centre, it is reasonable to assume, will not be in Yorkshire. But we must urge that it be found in a district where hills are many and the course is of the stiffest. The same remarks apply to the two one-day trials.

NOTES ON T.T. SILENCERS.

THIS heading may appear rather misleading, as it will be remembered that this year's T.T. regulations demanded merely a long pipe leading to the rear of the frame, no actual silencer being required. It is concerning this long pipe that these remarks are penned. Firstly, let me say that the new T.T. regulations have had an evil effect, in this way. A certain class of speed merchant who goes tearing about the country with both ends of him at about the same level is apparently under the impression that noise means speed. The class of rider I refer to, with the excuse of the Isle of Man regulations, immediately discarded his reasonably effective silencer, and in some cases extended his exhaust pipe to the rear of the frame. I am not sure that some of the present outcry against noisy motor cycles cannot be traced to the "long pipe" brigade.

I must confess that for some time past I have been riding machines fitted with this type

The longer the exhaust pipe, the more silent the engine.
Above is an amended design of spiral exhaust pipe which should prove effective.

of silencer, and have seen it in most of its many and various forms.

The two most successful forms that I have used so far consisted (1) of a pipe extending to the rear wheel, blocked up at the end, and drilled with 3-32in. holes for a considerable part of its length (probably 18in.) When throttled down this machine was extraordinarily quiet, and when opened out made only a pleasant sound to which no reasonably-minded road user could take exception. No perceptible increase of power was noticed when the end was cut off, giving a clear exhaust, so that back pressure must have been practically non-existent. The second silencer arrangement was on a twin-cylinder engine. This had the ordinary pattern separate exhaust pipes and silencers, the only outlet from the latter being along a pipe connecting the two and extending to the rear hub. The engine never got hot, an engine knock was less frequent than a puncture, and at slow speeds the exhaust was practically inaudible.

Interesting Effect of Saw-cuts.

It is curious to note that the exhaust noise from an open-ended pipe can be considerably decreased by drilling a quantity of holes, or making saw-cuts near the end of the pipe. The diameter of the pipe considerably affects both the power of the machine and the noise, and in this respect I should like to mention that a great increase of power can be procured by fitting enormous pipes permitting rapid expansion of the burnt gas. It is possible with a pipe of correct diameter and length to get a suction effect in the pipe,

caused by one charge leaving the pipe at high velocity, so causing a partial vacuum and helping out the succeeding charge.

An Actual Experience.

Recently while striving after this effect I reduced the diameter of my exhaust pipe from $1\frac{3}{8}$ in. to $1\frac{1}{4}$ in. outside measurement, and though the pipes were of the same length and shape I was astonished at the pronounced increase in noise. At first this struck me as curious, but the explanation is very simple, for owing to the reduction in diameter the gases leave the pipe at a higher velocity, and so cause a louder explosion. I am inclined to think that the reduction in exhaust pipe diameter has slightly increased the power of my engine, but it has been fitted so recently that I have not had time to make certain of the fact. I do not wish to advocate a general reduction in the diameter of pipes, but merely to call attention to the fact that they can be made too large as well as too small.

It does not appear to be generally known that with a properly designed silencer an engine will produce more power than when exhausting direct into the air. This fact was established at the one and only real silencer trial in Paris in 1907, and proves that a user of an exceptionally noisy machine is very inconsiderate, for he is gaining nothing. While there is such an outcry against noise, why are not trials of this description organised here? Surely we are sufficiently in need of an efficient motor cycle silencer. Only recently we heard that a certain well-known rider in tuning up at Brooklands petered out after one lap when using a really silent silencer.

The Good Effect of the Brooklands Rule.

Let us hope that the new Brooklands regulation, requiring all motor cycles to be fitted with efficient silencers for racing purposes, will induce our designers to pay more serious attention to this all-important matter.

I should like to point out that the Brooklands silencer rule has not affected the speed, as was predicted. The Humber lightweight records were accomplished since the rule came into force, and while I write I hear that Stanhope Spencer has just beaten his own long-distance records on a Rudge, this time with a silencer fitted. Other aspirants are now practising on the track, and may attempt record at any time. If

Suggested "injector" silencer.

these records are possible, why not fit efficient silencers as standard to all touring machines, and do away with the cut-outs, which are bringing motor cycles into evil repute?

There is much room for experiment in the design of the final outlet for the gas, and from my own

Notes on T.T. Silencers.—

experience I may say that a swaged down outlet causes quieter exhaust, but produces a whistling sound, while a flattened end causes still further reduction in noise and does away with the whistle.

I believe that a very efficient silencer could be constructed on the injector principle, *i.e.*, with a funnel or series of funnels fitted over the end of a long exhaust

pipe, with their large ends facing forwards. By this means the gases would be gradually cooled, and at the same time no back pressure produced. If anything, there should be an opposite effect. I am told that a silencer on these lines is being marketed, but I do not know its name. I should, however, be interested to hear of it and its effect on noise and power.
H.D.T.

The Luxury of a Spring Frame.

DISMOUNTING from a rigid framed machine we were riding the other day, we were attracted by a smart-looking spring frame motor bicycle leaning against the pavement, and the owner, by some means learning our identity, pressed us to try the machine. We did, and never remember a more convincing testimony to the luxury of a spring framed mount. Instead of the jolting we had experienced on the single-cylinder rigid framed mount every time a pothole in the road lay in our path, the spring framed mount glided over the roads, no matter whether they were rough or smooth, absorbing the road shocks in a truly surprising manner. That machine was the P.V., a comparatively little known make, which made its appearance about Show time last year, and, hearing that the machine was to be exhibited at Olympia, we arranged with the makers a more extended trial to satisfy our cravings for comfort, so that we are in a position to speak from actual experience.

The machine is illustrated on this page, and it will be obvious at a glance that the P.V. does not possess the disadvantage of many spring framed machines, *viz.*, unsightliness. The suspension of the front portion of the machine can well be left to the Druid forks; the springing of the rear wheel is the novel point. Around the seat tube long spiral springs are mounted. These springs control the movement of a pair of stays, at the opposite end of which the rear axle is supported. The stays are hinged at the point at which the ordinary rear stays meet.

Spring Frames and Spring Seats—the Difference

This design cannot be compared with a spring seat pillar. With a spring frame the rider remains practically motionless, whereas in the case of a spring seat pillar—which admittedly is a step in the right direction—the rider is constantly moving up and down. The engine fitted to the P.V. is the new $3\frac{1}{2}$ h.p. m.o.i.v. twin J.A.P., with cylinders 60×76 mm., and this little store of compressed energy largely conduces to the extreme comfort of the machine. By that we mean that the engine is beautifully balanced, besides which the machine is a hill-climber of exceptional merit, and speedy at that.

Altogether we were very much impressed with the running of the P.V., and any reader who may be dis-

satisfied with the comfort of his mount would do well to try the machine under review. It is an object lesson in itself to glance down whilst riding the P.V. and observe the action of the wheel-supporting stays. Though the rider is unaware of it, since none of the jolts and jars occasioned by road inequalities are transmitted to his spine, the springs are never still a moment. The member of our staff who rode this machine has no hesitation in saying that it is the most comfortable of the forty-six different motor cycles he has sampled this year.

Other features of the P.V. include a dropped top tube giving a low saddle position, handle-bar con-

The 1912 4 h.p. twin-cylinder P.V.-Jap with sprung back wheel.

trolled magneto, and rubber-covered footboards. The silencing arrangement is most effective. The exhaust first enters the large-sized box under the right footrest, and the burnt gas is afterwards conducted

Showing details of the P.V. springing mechanism.

rearwards along a short spout-ended pipe. At low speeds the exhaust is practically inaudible, yet the engine remains comparatively cool on long non-stop runs, and seldom, if ever, knocks. Messrs. Seale and De Becker, Ltd., 162, Gt. Portland St., W., are the sole selling agents for the United Kingdom.

OCCASIONAL COMMENTS

G. Ixion

Clean Crank Cases.

A valued correspondent, who is a stickler for detail perfection, writes anent the above to say that there are many engines which cannot be cured of their dirty oil leaks, either by machining the surfaces, anointing the joints, smearing the faces with shellac, or inserting asbestos or paper washers. A common trouble is excess of pressure in the crank case, and if the oil deluge be checked at the faced joints, it will be exaggerated at the tappet holes. He believes that many of the crank case release valves on the market are efficient only at one speed. At any rate, he claims to have cured several engines, infamous for this propensity, merely by adjusting the lift of the non-return valve, and he personally recommends a very reduced movement for the ball, *e.g.*, $\frac{1}{32}$ in. There is obviously a great deal of sense in this. These tiny balls must be ruthlessly flung about at high speeds, and it is obvious that they may "chatter" at one speed, and be held almost constantly against their stops at other speeds—especially at those higher speeds beloved of friend Gibson's bugbears, when oiling is frequent and free. If the pressure be sufficient to hold the valve permanently shut against the egress of compressed air (or "oily fog," as somebody calls it), the pressure may well drive oil out of the most workmanlike joint. What is to be recommended—a double valve, an entry of wide bore to the valve, a small lift, or what? I leave it to the makers to experiment. I will only say that at present there are very few makes of engines that are clean by nature, without prolonged faking. I know a man who last spring paid upwards of £60 for a 1911 model, which was the worst oil-finger I ever encountered.

Side-slip.

I sometimes fancy I may begin to call myself an old hand at our pet game, but within the last month or so I have made two discoveries about side-slip that are new to me. The first is that one of my machines was a great offender on grease with the saddle well back, as I usually rode it; I then lent it to a friend, who set the saddle right forward, as he was shorter in the arm. Taking the machine out without readjustment, I found it rode absolutely steadily over filmed tramlines. The man who slithers may therefore derive relief by experimenting with his saddle position. Incidentally, this experience explains a series of events which upset my pride vastly some years ago. I always fancied myself on grease, but in a certain trial, when the road surface was at its "vaselinest," I could not keep my machine straight, although several comparative novices steered a bee line, and mocked me uproariously. Query: Had I got my saddle too far astern?

The other discovery relates to wide handle-bars. I usually employ a pair of gigantically wide dropped bars, and with them I am at times rather daring around

greasy corners. Exchanging them for the usual narrow and demure upturned tourist types, I found myself slithering with the worst of them. For this winter, gentle reader, watch for a short, portly, middle-aged rider of fourteen stones careering at highly illegal speeds over the worst grease, his saddle right forward over the pump handle, and his arms akimbo over a pair of 4ft. bars. When you sight this astounding phenomenon, you will know you have solved the interesting puzzle of "Ixion's" identity.

Magneto Drive.

I wrote some while ago of the need for an improved method of adjusting the magneto timing, and specially emphasised the dexterity needed to obtain a very close adjustment, and the possibility of the friction-held sprockets and pinions to slip. These defects were admittedly small, but perfection is composed of a multitude of refinements, and the defects in question are a far greater nuisance to the average rider than to a select band of experts. The accompanying reproduction shows that one firm at least has endeavoured to eliminate these imperfections. The illustration re-

Details of the Rudge magneto timing, similar to the Vernier micrometer adjustment.

presents the Rudge 1912 drive. The spiral groove cut on the spindle is designed to conduct excess of oil away from the armature. The driving sleeve is an integral part of the axle, and has fourteen teeth or flutings cut on it; on this is threaded a driving pinion with thirty-one similar teeth or flutings, which has a little flange enabling it to be picked off by the finger-nail or a knife-blade during adjustments. The flutings afford a range of 434 settings, *i.e.*, adjustments to less than one degree. There is no springing, prising off the pinion, to be done, and the parts cannot change position when once adjusted, as is the case with the ordinary taper and lock-nut. [The Simms Co. were exhibiting a micrometer adjustment at Olympia last week, and A. H. Hunt showed a similar contrivance last year.—ED.]

A REDUCING TRANSMISSION GEAR.

An Interesting Design having Possibilities for Motor Cycle Use.

THE main characteristic of this invention, which was introduced some years ago, is a form of constant wedging action of the peripheral engagement and release of the eccentric rings, which offers the necessary resistance to slip, the noise and expense of spur gear being eliminated.

In the illustration a driven disc D is provided with a trio of rollers B, carried by the pins A. Each roller B is embraced by a wide tempered steel ring E, approximately two millimetres in thickness, and riding loose on the rollers. There is a driving sleeve C, and a stationary circular containing-case F, both of which exert pressure against opposite sides of the rings E, so being spaced that they compress the rings out of round for about one half of a millimetre. It is further to be noticed that the driving sleeve C is borne solely by the rings E. An apparatus upon this plan has been constructed whereby the sieve turns at 10,000 revolutions per minute with the disc D rotating at some 825 revolutions, immunity from any tendency to slip being claimed by the manufacturers.

COCKERMOUTH MOTOR CYCLISTS.

The solo rider is T. W. Hall (who rode in the Isle of Man races) on his Bradbury. The occupants of the sidecar are Mr. and Mrs. R. Wigham on their 3 1/2 h.p. L.M.C.

This style of gearing constitutes an epicycloidal train of friction wheels wherein the compensated elasticity of the rings E is adapted to impart rolling friction. I am inclined to believe that such a system would work well when applied to the motor cycle, and by the exercise of a little ingenuity it could be disposed to form either part and parcel of the engine or the rear hub, as might be found most convenient. The mechanism is undeniably compact, it possesses but few parts, is weather-proof, and there is little liability to get out of order.

ENGINEER.

A COMPLETE TOURING KIT.

A SIMPLE HOME-MADE VALISE.

FOR the benefit of tourists, I venture to describe a kit which is the outcome of twenty years' experience in motor cycle touring and military camping. The main idea is a canvas or holland roll, like a tool roll. Open, it measures 12in. wide x 17in. long, and rolled has a girth of 15in.; weight, 2 lbs., with two pairs of socks inside. I always keep this packed ready for a start at a moment's notice. There is a named and buttoned pocket for each article.

This was made for me by a little girl about twelve years old, to show her skill with the needle, so nothing very elaborate is needed.

I bought the thinnest pair of pyjamas obtainable, and a flat rubber sponge in a canvas bag—the mackintosh ones wear through so soon.

PACKING.—Place the kit at the end of the pyjamas duly folded and extended. It then forms the nucleus of a very compact and tightly rolled bundle. A small towel is rolled outside, and an old pair of evening shoes go under the strap. Weight, 4 1/2 lbs.; length, 12in.; girth, 20in. This fits into a black japanned bag known as the "Ark," and made by Lycetts. It resists wet, and does not absorb dust like canvas. It is strapped to the carrier, and remains there for the duration of the tour. On arrival, undo one all round strap, extract your "swag," and take it indoors clean and free from dust. At a pinch I can include a pair of grey flannel trousers, and can then tour in comfort for an indefinite period, having the necessities for a week-end or Bank Holiday when shops are closed or otherwise inaccessible; for a longer period I should have to buy a few things or get some washing done.

The point is that the packing can be very much closer when everything is rolled instead of folded. Likewise, the packing and unpacking every morning and evening, usually such a bugbear, are reduced to a minimum, and having a named place for all small articles ensures everything being brought away from each stopping place. Many a time have I reached home to find on unpacking my kit that I had left something behind.

TOURIST.

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 26, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Hints on Lubricating the N.S.U.

[6044].—With regard to the letters that have recently appeared on this subject, by simply oiling my gear with thick oil I find I do not get any oil working from it. A delay of fifteen minutes once in a couple or three months to take out the clutch is amply repaid in smoothness and ease of running. Blacklead is sifted into the oil and smeared all over the clutch parts, and then grease pressed into the gearing part. I used to find the latter part almost dry after a short time if only oil were used, but the grease keeps it in fine condition for months. The oil hole provided certainly allows oil to be injected into the gearing part (where I do not require it), but not into the clutch itself unless the whole of the back part is very much over-oiled, when the clutch gets the overflow. My gear never grips suddenly with the blacklead lubrication, nor do I think it slips so readily when on top gear.

J. T. G. PHILIPS.

An American Lamp Hint.

[6045].—I have gathered from previous issues that a great deal of trouble is experienced in the maintenance of a good light for winter, and it occurred to me that the following might be of use to your readers.

A small bandful of absorbent cotton or waste placed on top of the carbide for the water to drip on before reaching the carbide will cause the flame to burn as steadily as gas from a Presto-lite tank.

The cotton should be moistened when put in to get ready service.

I have been told that two ounces of peroxide of hydrogen H_2O_2 added to one quart of soft water makes an excellent liquid for the generator, and that it almost doubles the light.

Virginia, U.S.A.

FRANCIS C. TURNER.

A Light Belt-driven Quad.

[6046].—Along with others I have been experimenting with a light quad-car to carry one person, as I am a great believer in this sort of machine for many purposes. I have adopted for preference a 4 h.p. water-cooled Fafnir motor which is placed car fashion in front with radiator and bonnet. Motor drives by chain to counter-shaft, on which is fixed a substantial leather-faced cone clutch to give free engine. This clutch is worked by pedal like that on a motor car. Back wheels are driven by side belts (Whittle). Back axle is mounted on single elliptical springs with long shackles, and so is free to move backwards and forwards, but in normal condition is held back by a strong coil spring which always keeps the driving belts at the right tension. For simplicity and lightness I have adopted tiller steering. A foot accelerator works the throttle. A simple bucket seat or any kind of light body can be fitted. The weight of the machine complete is $2\frac{1}{2}$ cwt. The frame is made of ash, and reinforced with steel flitch plates. The tyres are 26in. x 24in. I consider this machine can be made and sold for £55, and show a reasonable profit. I should be pleased to show it to any of your readers in this district (Southport) who may wish to communicate with me.

J. COOP.

B18

A Farlow Bank in the Manchester District.

[6047].—Having seen letter 6002, headed as above, I may state that I accompanied Mr. Geo. H. Shaw on the day that he failed at the second attempt. I was riding a $3\frac{1}{2}$ h.p. two-speed Bradbury and sidecar, and I climbed the hill with a passenger until I was within twenty yards from the top, when my machine stopped, owing to the slippery state of the surface. I immediately re-started and reached the top without further trouble.

As Mr. Shaw states, the first hundred yards of the hill make a gradient of about 1 in 4. I had never seen this hill until the day of the performance.

RUPERT WHITWORTH.

The Suggested Midland Racing Track.

[6048].—With reference to the proposal for a circular track for motor cycle racing in Birmingham, I may say that I was the instigator of this idea, and knowing the sporting proclivities of the Birmingham public, and also the fact that it is in the centre of the motor cycle manufacturing district, I think there is every hope of a track of this description proving a big success in the Midlands. What I would like to propose is, that a meeting of the manufacturers and all interested should be called at Olympia during the Show week to discuss this matter fully. I may say that many of the manufacturers to whom I have mentioned this matter promise financial support, so that if it is fully discussed at the Show, I should think there would be no difficulty in getting the scheme to work.

FRANCIS A. McNAB.

Up Edge Hill on a Single-speed Sidecar.

[6049].—The letter from Mr. W. G. Bower, of Zenith Motors, Ltd., in your issue of the 26th ult., seemed to me to be quite uncalled for.

I take it that the Triumph Co. had nothing to do with Mr. Brandish's attempt to climb Edge Hill single-gear.

However, since Mr. Bower has chosen to write in this strain, it would be interesting to recall how Zenith-Gradua

Novel design of spider quad referred to by J. Coop.

machines fared in the last T.T. race, which was admittedly the most severe test that the variable gear has yet experienced. If I remember rightly they were not placed very high in the list, whereas the single-gear Triumph secured the first four places of the single-cylinder machines.

TRIUMPHITE.

'CLIPPER' EXHIBITS AT OLYMPIA (STAND 25).

AMONGST THE CROWDS AT OLYMPIA

Motor Cyclists will be on the look-out for anything and everything new in the way of Motor Cycle equipment.

ALL ARE INVITED TO STAND 25

where the Clipper Tyre Co. Ltd., will have a unique display of their Motor Cycle Tyres and Accessories, Repair Outfits, Motor Clothing, General Rubber Goods, Wood Rims, etc., etc.

MAKE A POINT

of inspecting the Reflex-Clipper "Ideal" Tyre for Motor Cycles—the tyre that is built on Car Tyre lines, and which, for speed, hard wear, and security, stands high in the public favour. Two new tyres have been added to this class, viz.: the Clipper (Rubber Studded) and the Clipper (Ribbed Pattern), forming a trio of tyres equal to every demand.

ASK TO SEE "CLIPPER" DETACH- ABLE TUBES (Butt Ends).

This latest of time savers bids fair to revolutionize tyre repairing. Can be drawn clear of the cycle repaired and replaced without removing the wheel—a great saving in time and labour.

"CLIPPER" BRAND ACCESSORIES.

This famous Line covers the whole range of necessities for Cycle and Motor Cycle Tyre repairs and replenishings. A variety of new features will be found, including the "SILENT" REPAIR OUTFIT for Motor Cycles. This is a leather roll whose numerous pockets contain every conceivable necessity for tyre repairs. Folds up surprisingly small, and is noiseless—compact and highly efficient. These are but a few of the items contained in the Clipper Company's comprehensive range on view at the Olympia Show.

**REMEMBER THE DATE—NOV. 20—25
AND THE STAND—No. 25.**

Record Breaking Methods.

[6050].—I have been interested in a case recently tried at a London police court, which shows a little of the inner history of record-breaking and, incidentally, how the A.C.U. may be induced to accept some men as private owners.

In the evidence it transpired that for breaking a record a sum of £10 and a motor cycle was to be the remuneration. It is useless to expect any reduction in the price of motor cycles and accessories so long as such large sums of money are frittered away in this manner. I hope the A.C.U. will deal with such riders in the proper way by banning them.

H. E. RENDALL.

Wear of the Big End Bearings.

[6051].—I have read Mr. C. Binks's letter on this subject, and I quite agree that the arrangements made for lubricating big end bearings are ludicrously inadequate. In fact, it has always been a mystery to me how they obtain any lubrication at all, since they do not even dip into a pool of oil when the engine is running. Any oil there is in the crank case is carried round in two ridges on the periphery of the flywheels, and the "oily fog" he refers to is clearly useless for lubricating a bearing subjected to very high pressure, even if it exists at all. On the other hand, motor cycle big ends have been oiled in this way from time immemorial, and the rapid wear of which I complained is only a development of the last two years.

The forced lubrication which your correspondent suggests, together with half a dozen other features I could name, will inevitably be found on every machine in a few years' time, but manufacturers appear to have a rooted objection to fitting even the most obvious improvements until they are absolutely compelled to do so.

JOHN KENNEDY, jun.

[Mr. Kennedy is somewhat hard on the makers. The best makers are only studying their clients' interests in testing every new device and improvement before adopting it.—Ed.]

Analysis of Carbon Deposit.

[6052].—With respect to my seeming omission of figures (page 1146, November 2nd) given in the composition of the ash, the difference, in the addition of the constituents, from the total percentage, is due to the oxygen combined with the metals present not having been given to you.

To simplify the description of my analysis, I gave the results of the metals only, not the metallic oxides.

In explanation, the iron found is determined as ferric oxide (Fe_2O_3), it being present as such in the ignited residual ash.

Now the 9% of iron, plus the oxygen necessary to convert it into ferric oxide as found, amounts to 12.8%.

If about half a dozen of your readers would send me, through you, some of the deposit from their cylinders it would be a decent sample to operate upon to see if there is very much road matter present. Of course, the deposit I analysed was from *inside* the piston head, which accounts for the absence of road matter.

W. ELDER (AO 302).

Single-cylinder Machines and Sidecars.

[6053].—A good many letters have appeared on the subject of $\frac{3}{4}$ h.p. machines taking a sidecar satisfactorily.

For the benefit of those who may be perplexed, and in doubt if long journeys can be taken, I should like to say that during the early part of last August I drove my $\frac{3}{4}$ h.p. two-speed 1910 Humber from Essex to Exeter and back, and not by the most direct route, 600 miles. We rode six and a half days; the passenger I shed once only through under-estimating the gradient; weight of passenger and self $19\frac{1}{2}$ stones. It was the hottest week in the summer. A strong head wind I find the most troublesome for the machine, and it is a very formidable hill the low gear will not take the combination up—one would then like three speeds, driving against a strong wind on the middle gear.

Our only trouble was a puncture or two and belt pulling through. Since the journey I have used a 1in. belt for sidecar work. You get a larger gripping surface on the small pulley with the same gear owing to the belt not bedding itself down so much in the back pulley groove. I have not found the belt jump the pulley.

R. H. ADAMS.

[6054].—Your correspondents' letters [5985 and 5986] would lead your readers to think that none but expert riders with well-tuned engines can successfully tour with a single-cylinder machine and sidecar.

Now, I am no expert, yet I have had some most pleasant and successful tours this summer with my Bradbury (two-speed) and sidecar, for one of which tours, Lancashire to south coast of Wales, you most kindly and promptly sent me the route, and a most delightful one it was.

My machine has not been tuned up all the summer, but I have ground the valves in and cleaned out all carbon deposit after about every 1,000 miles.

If a single cylinder two-speed machine will do what my machine has done—150 to 200 miles per day—without any further trouble than tightening the belt, your readers need not fear being able to do some good touring with a single cylinder machine.

The advantages of a single-cylinder machine are: (1) Initial cost 30 per cent. less; (2) cost of running 30 per cent. less; (3) simple construction.

If your readers can afford the more expensive twin, by all means have one, but to those who are not "speed merchants" and have not a long purse, my advice is, do not miss the pleasure that can be got out of a good inake single-cylinder two-speed machine for sidecar work.

W.B.L.

[6055].—Certain enthusiasts claim that a $\frac{3}{4}$ h.p. will take a sidecar and passenger "anywhere," and do anything a 5-6 h.p. twin can do. Let them try route 746 Contour Book, Tavistock to Ashburton (Devon) with sidecar and passenger.

I was over this in the direction of Ashburton with a 5-6 h.p. two-speed (4.4 and 7.7 to 1) Bat and coach-built sidecar last week, and for a succession of steep gradients should imagine it hard to beat. I am acquainted with Birdlip, Sun-rising, and Edge Hills, etc., but none approach the climb out of Dartmeet for gradient on two humps. What say others acquainted with this hill?

I have had experience with sidecars attached to $\frac{3}{4}$ h.p. P. and M. (two-speeds), $\frac{3}{4}$ h.p. Triumph 1903 (single-gear), 4 h.p. Roc (two-speed), $\frac{3}{4}$ h.p. Triumph-Roc 1908 (two-speed), $\frac{3}{4}$ h.p. Humber 1911 (two-speed), $\frac{3}{4}$ h.p. Triumph-Roc 1910 (two-speed), but I did not find any of them equal to a good twin. Occasional sensational climbs up estimated and grossly exaggerated gradients, with highly tuned, very low geared (a factor nearly always missing or guessed at) $\frac{3}{4}$ h.p. machines have not changed my view. Also I find

Miss M. E. Fisher ($\frac{2}{3}$ h.p. Douglas), who is said to be the first lady motor cyclist in Taunton.

my twin more economical of the two in actual running costs. I get sixty to seventy miles to the gallon according to country and speed, and can average thirty miles per hour and take Birdlip, etc., on the run (provided my belt is tight). A 2½ h.p. Kempshall has done 1,820 on the back and 250 so far on the front, and has a lot left. The fly in the ointment is belts—a Whittle perhaps alone is up to the work, and these slip very badly sometimes on steep gradients even when properly adjusted. Chains are troublesome, unless run in an oil bath chain case. H.P.B.

The Strength of Sidecar Axles.

[6056].—Adverting to a correspondent's enquiry in the last issue regarding the strength of our sidecar axles, may we be permitted to say that during the ten years we have made sidecars we have never known one of our sidecar axles to break. We attribute this to the fact that all our axles are turned from the bar, and the hubs are made throughout in our own works. We have never used hubs or axles other than our own make. MONTGOMERY AND CO.

Appreciation of a Quadcar.

[6057].—In one of your September issues there appeared a photograph of a quadcar seen at Shanklin, Isle of Wight, describing it as having an 8 h.p. Aster engine, etc. I am sending a photograph of this vehicle with special body (which has just been fitted) at the conclusion of a 200 miles run, in the day, last month. It is a G.N., with an 8-10 h.p. J.A.P. engine, and is capable of 45 m.p.h. on level roads (by speedo-

An 8 h.p. G. N. runabout, capable of 45 m.p.h.

meter). It seats two abreast, and is extremely comfortable and well sprung. The petrol consumption works out between 50 and 60 m.p.g.

I have not yet found a hill that it would not take (two up), and in the island it roared up Ventnor's steepest hill, which is supposed to be about 1 in 4. I have had no trouble with it, except that the belt required shortening when new. It is extremely light on tyres and infinitely more enjoyable than riding a motor cycle. CECIL WHITEHEAD.

Overheating.

[6058].—With reference to letter No. 5987 entitled "Overheating" in the correspondence column of *The Motor Cycle* of October 26th last, I should like to offer my theory as to the reason why overheating takes place with either too weak or too strong a mixture.

As practical experience shows, the line of reasoning adopted by Mr. B. S. Field must be wrong. It may seem quite reasonable to a person who is not a trained engineer, but certain important points have been omitted which have a very great effect on the matter.

It should first be clearly understood that a perfect explosion (such as is obtained by a perfectly correct mixture) with a high speed engine, such as a petrol motor, gives

very nearly adiabatic expansion, that is to say, an expansion during which no heat is either added to or taken away from the expanding gas. All the work is then done at the expense of the heat stored up in the gas, and accordingly the temperature of the gas falls very rapidly during expansion. Now considering the case of either too weak or too strong a mixture.

In both of these cases a bad mixture is obtained which will, however, burn, but only gives a comparatively feeble explosion on ignition. Accordingly what happens on ignition in the cylinder is that a feeble explosion results, giving a fairly low maximum pressure. Then for some portion of the stroke burning of the mixture takes place. Now considering what happens during expansion, we have the gas expanding and doing work at the expense of its heat energy, and its temperature should drop accordingly, but, on the other hand, heat is still being added during the expansion from the burning mixture. The temperature of the gas, therefore, remains higher than it should be, making the adiabatic expansion approach more nearly to an isothermal or constant temperature expansion.

It is obvious that by suitably proportioning the mixture an isothermal expansion could be obtained. If we now consider the heating of the cylinder in these cases we can see that in the case of a perfect explosion the temperature of the gases may be high at the start, but drop very rapidly to the exhaust temperature. The mean temperature, therefore, will be approximately that of the cylinder walls, and will be fairly low.

Now in the case of a bad mixture, heat is being constantly added during expansion, and therefore the mean temperature, which will again correspond approximately with that of the cylinder walls, will be fairly high.

This is the reason why overheating takes place with bad mixtures. A proof of the correctness of the above theory is found in the fact that the temperature of the exhaust is much hotter with bad than with good mixtures, and in many cases if the mixture is excessively bad the exhaust gases will still be found to be burning. GRADUATE.

Will the Ultra-lightweight Return?

[6059].—With all due respect to Mr. Roy Walker's contentions, I think he is rather sweeping as to "flimsy frames" and "impossibilities." Many are situated like myself, living in a terrace house with many steps up to the door and as many to the basement entrance. The ultra-lightweight makes motor cycling possible to such. My own machine is a 1908 1½ h.p. Motosacoche. The frame has given no trouble. I carry this with ease up and down the steps, and while, of course, comfort cannot be a first consideration, the machine is a splendid little mount, and if kept in tune will run and average on a fifty miles journey well up to the legal limit in flat country. RAE GRIFFIN.

[6060].—I have read with much interest and a considerable amount of amusement the effusion of Mr. Roy W. Walker No. 6030. Your readers will be amused when I tell them that it was a 1½ h.p. Motosacoche attachment fitted to a light bicycle which was used by Mr. Walker's company to test and bring out the Armstrong change-speed gear. Judging by Mr. Walker's remarks, one would conclude that it was possible to test and bring out this gear with a so-called flimsy engine.

When Mr. Walker states that "every attempt to make a complete roadster motor bicycle at under £30 and 75 lbs. weight has failed dismally, etc.," he is apparently in ignorance of the motor bicycles that have been on the market during the last five or ten years. Has not the Motosacoche proved that it is possible to turn out such a machine?

I have not the slightest doubt that the thorough lightweight will again become popular, much more so than the 140 lbs. weight machine, for the following reasons: There are an enormous number of people who are tiring of pedal cycling and want a motor cycle. They want a thorough lightweight, but their "knowing" (?) friends have advised them that lightweights are not reliable, so these people have bought and are buying the heavier machine, but it will not be for much longer; the speed craze will end just as surely as did the scorching and long distance touring on pedal bicycles. One day the public will know which is the suitable machine; Continental folk have discovered this to their advantage long ago. OSBORNE L. DE LISSA.

CHAIN DRIVE

has been the standard form of transmission on the _____

Indian
MOTOCYCLE.

for the past eleven years, and its designers have found no reason to make any alteration in this respect.

It is significant that in the recent A.C.U. Quarterly Trials, out of the 12 machines with a perfect score, representing 11 different makes, no fewer than 9 were chain driven.

This testimony to the efficiency of the form of drive which has been standard on the INDIAN from its inception is worth your careful consideration when deciding upon your mount for 1912.

Designed for British needs—and equal to all conditions.

The Position of Counter-shaft Gears.

[6051.]—Your correspondent, "Long Belt Drive," is evidently working out what should occur in theory. My experiences on the road with a counter-shaft two-speed gear and short belt drive are exactly in opposition to his views. I have now driven my new two-speed $3\frac{1}{2}$ h.p. Singer over 600 miles, with and without sidecar, without adjusting the belt or even removing it at all. It is a 6ft. 3in. x 1in. Lyso, was put on new, and looks like running another 600 miles before shortening is required. This mileage has always been impossible with the average belt drive, without attention, in my experience. I may mention that the machine carried me through the last Quarterly Trial and the Midland Trial on the 28th ult., also in pouring rain, and the belt has never shown signs of slipping yet. I put the success of this form of drive down to two factors, viz., the large diameter of pulleys and the low speed at which the belt travels. Anyhow, your correspondent can order a rear counter-shaft two-speed machine at the Show with perfect confidence.

J. J. WOODGATE.

The A.C.U. and Provincial Clubs.

[6062.]—The members of the Newcastle M.C. have watched during recent weeks the correspondence in your columns with mixed feelings, and recent events bring home to us again the feeling that the conduct of the A.C.U. is "a comedy to those who think, and a tragedy to those who feel."

In view of the publicity which has been given to the dispute between some Northern clubs and the A.C.U., I consider it a public duty to acquaint the motoring world with the treatment accorded to the Newcastle M.C. early this year when applying for direct affiliation to the A.C.U.

I will briefly make public the particulars of our case and leave motor cyclists to judge as to what little practical support or sympathy a small provincial club may expect from the A.C.U.

The Newcastle M.C. has for some five years been affiliated (through the North-Eastern A.A.) to the A.C.U., but in December last year we decided to apply for direct affiliation, which latter privilege has been and is still enjoyed by several clubs in the Northern Centre. An application for affiliation was made to the R.A.C. (the club consisting of motor car members as well as motor cyclists), and this body advised us to deal with the A.C.U. on the dual affiliation agreement, and the same post brought us a letter from the A.C.U. giving full particulars and sending blank agreement forms. On the 15th December we advised the A.C.U. that we had previously been affiliated through the N.E.A.A.; and asked if by joining direct our car members would have the same benefits as before, and in a letter dated December 17th the A.C.U. replied: "In the event of your club affiliating to the Union, your car members would enjoy the same privileges that they now enjoy through being affiliated with the N.E.A.A." On the 11th January we advised the A.C.U. that we had decided to affiliate, and on the 14th January the agreement signed by our committee was posted and an acknowledgment received stating that the same would be laid before the A.C.U. committee on 2nd February. Meanwhile a rumour circulated in the North that the N.E.A.A. was opposing our direct affiliation, upon which I proceeded to London and interviewed the chairman and secretary of the A.C.U., and was much surprised to hear that the N.E.A.A. claimed that all affiliation of clubs in the Northern territory must go through it. As our club had received no notice of any such agreement and being no party to it, although affiliated members of both organisations, we repudiated this. A proposal was, however, made to us with a view, I suppose, of settling our dispute with the N.E.A.A., but this proposal I indignantly rejected, and confirmed the rejection in a letter to the A.C.U. on 21st January. I could find no trace in the A.C.U. rules or N.E.A.A. rules giving power to make any such agreement, and was at that time at a loss to know how, if such an agreement were in force, the Cumberland, Westmorland, and Aspatia clubs could have direct affiliation. (Cumberland and Westmorland were included in the Northern Centre when same was formed in January, 1909.) A request was made to the A.C.U. for particulars of the alleged agreement, but the application was met with silence. On pressing the point of direct affiliation we got the admission "that the club rules of the Union permit direct affiliation of any club within

the sphere of a local centre, but that an exception had been taken to the policy of so doing, for, in some cases, it might be held that the principle of local government might be prejudiced by such an act." A further proposal was made to us which we refused, and in a few days came the intimation that the A.C.U. was unable to accede to our application for affiliation.

On the question of principle, we were inclined to press the matter, but meeting with poor support from the other affiliated clubs we decided to "stand outside the pale," and, instead of remitting a large sum in fees to Piccadilly, we purchased a handsome trophy for competition.

I should suggest that a strong Northern Association should be formed composed of clubs in Northumberland, Durham, Cumberland, Westmorland, and Yorkshire.

WILLIAM DUNN.

Hon. sec. the Newcastle Motor Club.

SUMMARY OF CORRESPONDENCE.

If "A.E." (Godalming) will forward stamped addressed envelope several replies to his query are awaiting him.

G. Gilbert writes in strong praise of the way he was recently treated by Zenith Motors, Ltd., in connection with a repair undertaken during the rush of Show work.

"A Victim" wishes to warn readers of the ten-mile speed limit in Stony Stratford, a village on the London-Birmingham Road about fifty miles from London.

R. Walker writes in strong praise of the 1911 Scott for use with a sidecar.

THREE PASSENGERS UP NETHERHALL GARDENS.

A $3\frac{1}{2}$ h.p. standard P. & M. with standard gears of 5 and 9 to 1, taking two passengers and the driver—W. Prait—33 stones 2 lbs. in all, up the 1 in 7 gradient of Netherhall Gardens. This is probably the best known of the London test hills. (1) The right angle bend immediately at the foot of the rise. (2) hearing the summit. Such a performance proves the efficiency of the $3\frac{1}{2}$ P. & M. as a sidecar machine.

NEW DESIGN MOTOR CYCLES

1912 MODELS

TO BE EXHIBITED AT OLYMPIA.

A.J.S.

A 5 h.p. twin-cylinder A.J.S. machine is to make its bow to the public at Olympia. This is quite a new type, and presents several novel features. The twin-cylinder engine has a bore and stroke of 70 x 82 mm. respectively, and has its valves lying side by side and carried in detachable cylinder heads.

Details of the valve gear on the new 5 h.p. A.J.S.

These heads are held on by a forging which bears on a central boss and is held down by two swing bolts (see sketch). A dowel pin is placed on one side, so that the head can only be put on in the correct position. Separate cams operate the exhaust valves, while one is made to serve both inlet valves. A U.H. mag-

neto supplies the current, and an Amac carburetter lies between the cylinders. A simple counter-shaft two-speed gear on the lines of this year's 2½ h.p. A.J.S. gear, but enlarged and simplified, is employed, in conjunction with a clutch consisting of a single plate carrying cork insets, gripped by a plain steel plate on either side. A new feature for this machine is the simple kick down starter. Chain drive is employed throughout, the chains being amply protected from mud by metal shields. The gear is actuated by a lever carried on a quadrant which is brazed to the top tube. The clutch lever lies on the left handle-bar. The A.J.S. gear was described in a recent issue, so it is only necessary to repeat that it, with the clutch, is particularly easy to dismantle, and the merest novice could make no mistakes in re-erecting it. The pistons have two top rings and oil grooves cut in them right up to the gudgeon pin boss. The gudgeon pin is held in position by brass washers.

The 1912 frame is fitted with a dropped top tube, and the tank has all the fittings on one side, so that it is very easy to remove in case of damage. A very neat toolbox is carried in a steel case below the carrier. The back of this case forms the number-plate, while a strap fixed to the carrier descends and acts as a mud-guard support. The foot brake pedal is carried on a separate lug, and the shoe acts above the chain stay, and is pivoted so as to come into action evenly. Druid spring forks are employed, and a neat

head lug is fitted with provision for a lamp and generator. All the above remarks apply to the 2½ h.p. A.J.S. with the exception of those concerning the engine, which in this case is a single-

Showing details of the detachable cylinder head on the 2½ h.p. and 5 h.p. A.J.S.

cylinder 70 x 82 mm. Both these models are well made and neatly finished, and the 2½ h.p. has performed extremely well in this year's trials.

A.J.S. special lamp and generator bracket.

Edmund Spring Frame.

This machine, which was exhibited last year, will again be shown by Charles Edmund and Co., of Chester, at Stand 100. The spring seat has been designed to enable both saddle and footrests to work in unison, both being supported by laminated springs. The saddle is attached to an upper member pivoted at the front to the head of the rigid frame nearest to the rear wheel axle. The footrests are attached to a member which passes through the seat tube of the rigid frame and are connected by means of link motion to the seat tube. The luggage carrier is situated on and supported by laminated springs, and by means of an adjustable link motion the tension of the springs against the carrier can be increased or diminished.

The Charles Edmund-Jap spring frame machine to be shown at Olympia.

Next Week's Issue of this Journal will contain a complete Show Report, with profuse illustrations.

1912 Models.—

Rex Patterns.

The alterations from the 1911 Rex models are not drastic, but they are sufficiently important to warrant a fairly lengthy description. For example, overhead valves have been discarded in favour of those side by side; large diameter valve springs are employed, and the shape of the cylinders has been slightly altered. The cylinders are secured to the crank case by two swinging bolts, which are hinged on the crank chamber connecting bolts, and pass through holes in the head, thus the cylinder casting is in compression to some extent, and can really be made slightly lighter in the walls than if held down by studs and nuts at the base of the cylinder.

Type of roller bearings used in the Rex engine.

One of the most novel alterations is the eccentric rim to the flywheels, recently illustrated. This has been adopted to secure not only a better balance without bob-weights, but the makers also claim that they can obtain a higher engine speed owing to the lessened friction due to air resistance in the crank case when ordinary bob-weights are fitted with angular projections. The internal cams have been discarded in favour of the usual type of outside cam. In place of ball bearings to the crankshaft, Hoffmann roller bearings have been adopted, and it is claimed that there is no more friction with this type of bearing, and line instead of point contact is obtained, the former being considered an advantage by the makers.

The taper gudgeon pin in the piston is retained, but a set-screw is added which

locks the pin in position and renders it absolutely secure. The magneto is chain driven, and is carried at the rear of the crank case, the timing gear cover plate and one-half of the magneto driving chain cover being cast in one as in the 1911

Showing design of connecting rods of the new Rex twin.

models. Arrangements have been made for re-timing the magneto by providing a special nut which screws on to the end of the armature-shaft. This nut is screwed externally in such a manner that when it is removed from the shaft and reversed

endwise, the externally screwed part engages with a thread cut on the inside of the sprocket wheel. The nut is then screwed inside the recessed sprocket until it butts against the end of the armature-shaft, when the force exerted by the screw draws off the sprocket, which is fitted on the coned end of the shaft in the usual manner. Of course the sprocket need not be entirely removed; the moment it is loosened the magneto can be re-timed and the nut reversed.

The Rex firm was one of the first to adopt the vapour pipe from the crank case to the combustion head, *via* the carburetter, and it has now been decided to fit this pipe direct from the crank case to the inlet port in the cylinder. The oily vapour which is forced up this pipe every time the piston descends assists in lubricating the top portion of the cylinder walls.

There are practically no alterations to the bicycle itself, except that the aluminium footboards have been replaced by neat wooden boards, which will be fitted on springs and covered with rubber matting. The arrangement of the exhaust pipes on the twin is neat. The end of the tube is merely flattened, and the result is not by any means noisy.

Singles and twins, air and water cooled, will be staged at the Show in racing and touring trim.

Showing the new 7-9 h.p. twin M.M. handlebars, and control arrangement from the twist grips.

The first of the new 6 h.p. Speed-King Rex machines.

1912 Models.—

A.S.L.

"Ixion" has lately drawn attention to the desirability of spring frames. Those readers who agree should on no account miss Stand No. 103, where the luxurious riding A.S.L. will be exhibited. $3\frac{1}{2}$ h.p. single and 5 h.p. twins are standard for 1912. Quite recently we had the opportunity of testing an A.S.L. $3\frac{1}{2}$ h.p. J.A.P. engined motor cycle. The machine started very easily, and declutching (the Albion engine clutch was fitted), we took our seat on the comfortably padded cushion supplied. On letting in the clutch the machine went away smoothly, and we were surprised at the absence of road shocks. Our first impression was that we were riding on a partially deflated back tyre, but the feeling passed off after the first few minutes. Although we intentionally found all the worst bumps in the road, we suffered from no unpleasant jars, and only in the worst pot holes did we find the small wheels affect the smooth running of the machine. It is certainly the best sprung motor cycle we have ever ridden, and the action of the air springs should go far towards prolonging the life of the engine and frame fittings. Magneto, throttle, and air levers are placed one above the other on the right handlebar, and come easily to the hand; in fact, we were able to control on the throttle lever only most of the day, as the Amac carburetter fitted was almost automatic in its action. By way of a hill-climbing test, we took the machine to Sunrising, and succeeded in climbing it at the second attempt with a little clutch slipping, the first failure being due in all probability to the control being new to us. Regarding the effect of the springing on belt tension, we noticed no belt slip, and as the springing forms a comparatively large angle with the chain stays, we see no reason to expect slip from this cause. The A.S.L. is sure to attract visitors to the Show.

Valve side of the new $3\frac{1}{2}$ h.p. lady's Premier, a new departure for next year.**Osmond.**

This is a new firm in the motor cycle industry who will exhibit on Stand No. 20 two Osmond-Precision models, one with fixed and the other with free engine. Both machines will be fitted with Bosch magneto ignition and B. and B. carburetters.

Hobart.

The Hobart Bird Co. are listing four models for 1912, two of which are quite new. The $2\frac{1}{2}$ h.p. 70 x 76 mm. ladies' machine remains much as this year, except that the dressguards are more easy to detach, as they slide on in one piece (for each side), and are held by wing nuts all fitted in accessible positions. The Armstrong three-speed hub will be fitted as standard, and foot-rests are now brazed to the frame in a convenient position. The 4 h.p. twin also remains unchanged

in its main features, but is now fitted in an improved frame specially constructed to withstand the strains of passenger work, and having sidecar lugs brazed to it. On this model the Lake and Elliot two-speed and Brown and Barlow carburetter will be standard fittings. The $3\frac{1}{2}$ h.p. single is quite new, and has an 85 x 88 mm. vertical engine, with side by side valves fed by a B. and B. carburetter, and carrying either a Bosch or Eisemann magneto in front. This power unit is carried in a strong frame with dropped top tube, and allows a very low

 $2\frac{1}{2}$ h.p. twin-cylinder Forward power plant.The new $3\frac{1}{2}$ h.p. 85 x 88 mm. N.S.U., which has a new design spring frame.

saddle position. The Villiers hub clutch is fitted, and instead of being operated by the usual long rod, which is liable to fracture through vibration, two short rods joined by a double lever pivoted on the rear engine plate are employed. The $2\frac{1}{2}$ h.p. gentleman's model has a vertical 70 x 76 mm. engine. This is a very neat little machine on standard lines, and may be classed as a lightweight. In this case the magneto is fitted behind the engine. Druid forks, side flaps carried right up to the crown head, handle-bar magneto control, and a foot-operated cut-out are standard on all models. As will be seen, the firm market a very complete range of machines, and great care in design and attention to details is noticeable in all four types.

1912 Models.—

Clyno.

In a recent issue we described a long run over severe hills and roads on one of the new 5-6 h.p. Clyno passenger machines, and we are now in a position to give details of the latest mount. The engine has two cylinders set at an angle of 55° of 76×82 mm. bore and stroke. The valves are placed side by side, closed within neat aluminium covers, and are operated by two cams only. Very large diameter flywheels are employed, though, as the weight is well in the rim, they are comparatively light. The lubricating oil

Clyno expanding clutch mechanism used for the high and low gears.

is led into grooves round the bottom of the cylinders, into which the pistons dip, and by this means the oil is led first to the cylinder walls, which are most in need of it. A two-speed gear is standard, and consists of two chains, one on either side of the rear wheel, which are brought into engagement by means of large expanding clutches placed between the rear stays and operated by a sliding wedge. The whole of this gear can be easily detached or adjusted, as it is held in position by four bolts (see sketch). It runs on ball bearings throughout, and is actuated by a double pedal working on a quick thread screw. When desired, this gear can be converted to a four-speed by

Mechanism of the Clyno foot starter, also showing neat appearance of countershaft two-speed gear.

a system of double chains from the engine to the counter-shaft, the change being made by means of dog clutches. All chains are enclosed, and a kick-down starter is fitted which works as follows: On what is usually the bottom bracket is fitted a toothed quadrant and a crank mounted in an eccentric bush (to allow of chain adjustment). This engages with a gear wheel mounted on the counter-shaft and driving it through a ratchet. To start, the crank is pressed sharply down by the heel, and when the engine starts the quadrant is left out of engagement

with the gear wheel, which is therefore free to revolve with the counter-shaft. A strong carrier is fitted, and an ingenious stand which gives three positions and allows the machine to stand approximately vertical even on a cambered road. The tank is held well away from the frame, and has rounded edges. It is fitted with very large spring-joint filler caps and an outside glass-barrelled oil pump, while the tool bag is placed on top of the tank. The exhaust gases pass to separate silencers which are connected to a common pipe leading to the back of the frame and flattened at the end. An Amac multiple jet carburettor feeds the engine, while a Bosch magneto set high up behind the engine supplies the current for ignition purposes. The 1912 model has been so arranged that both cylinders can be detached without dismantling the engine. The saddle remains the same height from the ground. Druid forks are employed, and the front mudguard has large side flaps. Both wheels are shod with 26in. \times 2 1/2in. Palmer Cord tyres. The Clyno sidecar is supported from four points instead of three, there being an extra stay to the side of the front of the car. In future all sidecar lugs will be

The toe and heel pedal operating the Clyno two-speed gear.

braced to the frame, though the Show models may not have this feature. The machine is extremely well finished both inside and out, and the buffed aluminium crank case gives an extremely smart appearance to the machine. For the running and hill-climbing powers of the Clyno we must refer our readers to our issue of the 2nd inst., in which the run previously alluded to was described, also to our reports of reliability trials.

Macbeth.

The Colmore Depot, Birmingham, will exhibit on Stand No. 102 a number of well known makes, including Scott, Douglas, Matchless, Zenith, Premier, Enfield, and Chater-Lea. In addition they will also show two examples of the Macbeth motor bicycle, a $3\frac{1}{2}$ h.p. machine built upon standard lines. One will be a fixed gear model and the

Section of the special front tube fixing of the Canoelet sidecar, described in our last issue.

other a two-speed. This is another case of a well known name in the push-cycle trade being applied to motor bicycles, the Macbeth machines having been known for several years to the cycling public, particularly to London

Front wheel stand, the legs of which serve as mudguard stays, fitted to the 1912 Singer, also showing the one piece mudguard with side extensions.

cyclists. We welcome the Macbeth machine as an addition to the industry, and have no doubt that in the hands of the Colmore Depot it will soon achieve a name for itself.

Latest design of the $3\frac{1}{2}$ h.p. A.S.L.-Jap.—an exceptionally comfortable machine to ride.

1912 Models.—

3½ h.p. Three-speed New Hudson.

The design of these successful machines has not been altered in any vital manner for next year, as they are already quite up to date. In consequence, the alterations are chiefly in connection with de-

Method of multiplying the clutch leverage on the 1912 New Hudson.

tails. For example, the rear mudguard and carrier can now be detached complete, leaving nearly the whole of the rear tyre accessible for repairs. The method of detachment is to unscrew two or three turns a nut on the mudguard bridge, when a slot in the clip allows for its removal. The same method is followed where the carrier stays are attached to the frame, the stay ends being slotted, thereby obviating the complete removal of the nut. The carrier and rear guard are riveted together and come away as one unit.

The method of carrying the pannier bags has been strengthened, and the interior of each bag is now provided with a metal framework which encircles the bag inside, thus strengthening it and preventing sagging; the fastening is a strong spring hook, and compares most favourably with the flimsy locks fitted to some bags, and the screws for attachment enter the metal band in the bag, and do not protrude inside, as in many cases. On the rear of the carrier is a special bag in which is carried a Lucas force feed oiler for lubricating the three-speed gear and other parts where oil should be injected.

The method of locking the axle of the

Armstrong hub to the back fork ends is as follows: The jaw of the back fork is made from a very strong steel stamping. The axle is provided with flats which prevent it turning in the jaw, and, in addition, a shouldered washer with a square hole fits inside the fork end. The face of the washer has holes which register with similar holes in the locking nut, and when all is screwed up firmly a grub screw passes through the nut and the washer, thus obviating the bursting strain on the jaw of the fork end, and relieving the axle of part of the stress to which it is subjected when the high and low gears are in operation.

The engine lug at the extremity of the down tube is now extended to take the clutch pedal, so that all strain is removed from the foot rests, and the pedal is not likely to be damaged in case of a fall. Where possible the lugs to which the engine is attached are brazed to the frame and not merely bolted. This has been found particularly necessary in the case of the variable speed geared machines where there is a heavy torque passing through the transmission and frame when the gears are in use.

On the New Hudson engine, which, by the way, is being made with extreme accuracy, the magneto drive is now provided with a chain adjustment, the mag-

Brazed-on lug carrying change speed lever of the Armstrong gear on the New Hudson.

neto machine sliding upwards at an angle. Slots are provided on the magneto table on the crank case, the drive being by means of an ordinary roller chain, the silent chain being discarded. The makers thought that in the event of a chain breakage (a remote possibility), riders would be able to obtain an ordinary link of ½ in. chain anywhere, whereas difficulty would be experienced in obtaining a link of silent chain, which

is not always stocked at garages. The new clutch-operating mechanism, which we illustrate, is now provided with an improved system of leverage, enabling the clutch to be operated with less pressure. The gear control bracket on the top tube is brazed to the frame. Nail catchers are fitted to both wheels, magneto control from handle-bar, and a front wheel stand.

Sidecar Self-aligning Stand.

A novelty in the form of a self-aligning stand for sidecars will be exhibited by the New Hudson Co. The ordinary stand when in use with a sidecar causes the machine to tilt at an angle owing to the sidecar wheel not being raised at the same time as the rear wheel of the bicycle. This new stand enables the back wheel to be jacked up off the ground without the base of the stand assuming a slanting position in relation

Browning's patent collapsible sidecar.

Valve side of the 1912 pattern 3½ h.p. three-speed New Hudson.

to the sidecar. All parts of the New Hudson 3½ h.p. engine are made to Government limit gauges which are within one-thousandth part of an inch. We recently examined the engine parts which were going through the works and came to the conclusion that greater accuracy is not employed in any factory where motor cycle engines are manufactured. Next year's New Hudson should give even a better account of itself than it has done during 1911.

Win-Precision.

The Wincycle Trading Co., Ltd., will show at Stand 16 two 3½ h.p. Win-Precision motor cycles, one of which will be fitted with the Villiers hub clutch. As the name implies, the engine will be a Precision, while Druid forks, B. and B. carburetter, and Bosch magneto will be fitted. The company will also show a patent collapsible sidecar, made under Mr. Browning's patents, which will appeal to those readers who have only restricted storage room.

1912 Models.—

2½ h.p. Enfield.

Very few alterations have been found necessary in the 2½ h.p. Enfield; in fact, refinements only are noticeable. Long footboards are fitted, and the two-speed gear will be operated by pedals. A new

be withdrawn while the rider takes her seat. An auxiliary dressguard has been fitted over the engine, and a cushion drive is employed. This is also standard on the 6 h.p. sidecar machine, and can be fitted as an extra to the 2½ mount. It consists of six rubber blocks divided by arms, through which the drive is taken. Three

days and Onions, Ltd., Birmingham.

This new runabout possesses several interesting features, particularly in connection with the springing. The frame and two-seated side by side body are supported on laminated springs which extend both sides of the single rear driving wheel, and are there coupled to a lever and rod system which enables the rear wheel to rise and fall and yet keep perfectly vertical. The engine, which is at present a water-cooled 7.8 h.p. twin m.o.v. J.A.P., is fitted between the body and the rear wheel mud-guard, and drives through an epicyclic gear carried alongside the engine, providing two speeds forward and a reverse. The transmission from the gear box shaft to the rear wheel is by a roller chain running in an oil bath, metal-cased. Side radiators are placed between the body

Left-hand side of the 1912 Model 2½ h.p. Enfield, showing the new sight-feed lubricator.

silencer with no cut-out is now used, and the crank case relief valve has been moved to the right hand side of the rear cylinder, and from it is led an overflow pipe, so that any surplus oil serves to lubricate the rear driving chain. An improved exhaust valve lifter is employed, having a very neat and simple action. The gear ratios have been raised to 5½ to 1 and 7½ to 1 instead of 6½ to 1 and 9 to 1. Lubrication is by a sight-feed drip, a hand pump being fitted for emergencies. Side flaps are fitted to both front and rear mud-guards.

The 2½ h.p. open frame has two or three extra refinements. A lever is fitted on the handle-bar, by means of which, when the engine has been started, the gear can

of these arms lie in the hub shell and three in the corresponding case on the driven sprocket. We rode a 2½ fitted with this device, and though the machine was exceptionally highly geared (4½ to 1), we noticed not the slightest jar even when running slowly.

We have already dealt with the new 6 h.p. Enfield-Jap sidecar combination which will be a feature of the exhibit.

Autorette.

The Autorette, which is a new two-seated three-wheeled runabout manufactured by the Enfield Autocar Co., Ltd., of Birmingham, and illustrated on this page, will, we understand, be on view next week at Stand No. 38, All-

Enfield rear mud flap.

and the rear mudguard, one on each side of the engine, and the whole mechanism is enclosed by a metal case provided with a sliding top panel. The steering is by wheel with inclined steering column like a car, and there is also a Cape hood and wind screen. The wheels are 650 x 65 mm., with plain tread to the front and steel studded to the rear; a butt-ended tube is fitted to the rear tyre. Two brakes are provided, one on the rear hub operated by a hand lever at the side, and one on the front wheel operated by pedal. The whole machine is finished

THREE-WHEELER PASSENGER MACHINES AT OLYMPIA.

(1) The Enfield Autorette with hood up. This machine has a water cooled two-cylinder engine.

(2) The Cyclonette which is propelled by a two-cylinder air-cooled engine, situated over the front wheel. The exhaust valve caps have special radiators.

1912 Models.—

Valve side of the new pattern $3\frac{1}{2}$ h.p. clutch model Excelsior.

in French grey, and the body is well upholstered, side doors being fitted exactly the same as on the larger four-wheeled vehicles made by the Enfield Autocar Co.

Excelsior.

One day last week we saw one of the new Excelsior motor cycles. This model has a $4\frac{1}{2}$ h.p. 86×112 mm. single-cylinder engine, and it presents several interesting features. A $3\frac{1}{2}$ h.p. 85×88 mm. machine is also built, but, as practically all the details are the same, a description of the $4\frac{1}{2}$ h.p. model will suffice.

The valves are placed side by side and have adjustable stem ends. They are operated by tappets through rockers, and these rockers are slightly offset to the cams, so as to get a more direct lift. The lubrication is ingenious, the oil being led from the new Best and Lloyd semi-automatic sight-feed lubricator to the cylinder walls and hollow gudgeon pin direct through the side of the cylinder, while a branch pipe lubricates the main crank case bearings through a system of ducts. The air release passes through the crankshaft. The frame is on standard lines with a dropped top tube, and is fitted with Druid forks, a strong carrier, and front and rear wheel stands.

Wulfruna.

The Wearwell Cycle Co., Wolverhampton, will exhibit several Wulfruna motor cycles on Stand 59. One will be a $1\frac{1}{2}$ h.p. machine with vertical engine, Bosch magneto fitted at the rear of the engine instead of in front, Druid spring forks, luggage carrier, stand and number plates. A machine with similar equipment will be the $2\frac{1}{2}$ h.p. model, but this will be fitted with a two-speed gear and free engine. A $2\frac{3}{4}$ h.p. and $3\frac{1}{2}$ h.p. single cylinder, also a 4 h.p. twin cylinder with two-speed gear and sidecar will be on exhibition.

Ariel.

Components, Ltd., Birmingham, have decided to list next year seven Ariel models. These will comprise $3\frac{1}{2}$ h.p. touring, $3\frac{1}{2}$ h.p. roadsters, and $2\frac{1}{2}$ h.p. lightweights. The Ariel engine-shaft, variable gear, and free engine will be fitted

to the touring patterns; the same machine will be sold with an adjustable pulley, and, if required, a similar model will be offered with a three-speed hub gear. The T.T. roadster models will be fitted with an adjustable pulley and no pedals, also a similar machine with Ariel patent variable gear and free engine pulley minus pedals. The two last-named will have dropped frames, and will follow the lines of the T.T. Ariel, which was the second fastest make of single-cylinder machine in the 1910 and 1911 T.T. races. The lightweight models are entirely new. One machine will be fitted with an adjustable pulley and the other with the Ariel variable gear and free engine.

Among the improvements for 1912 on the $3\frac{1}{2}$ h.p. models may be mentioned a new front wheel stand, new type rear stand and carrier, and improved rear brake. The half compression device for easy starting has also been redesigned, and will be found even better than before. Quite a novelty on the roadster Ariel machines will be a detachable tank and middle tube, enabling the tank to be bodily removed in a few moments, considerably facilitating the valve grinding.

and naturally without any obstruction the usual engine adjustments can be made with far greater ease. It also enables the cylinder to be lifted off quite easily without any risk of injury to the thin edge of the piston, which requires somewhat careful handling.

L.M.C.

We have recently had an opportunity of examining one of the new 4 h.p. L.M.C. sidecar motor cycles. The power unit is much on the lines of the standard L.M.C. $3\frac{1}{2}$ h.p., but the engine has had the bore and stroke increased to 89×92 mm. The compression is medium, and the radiating fins have been extended. The engine is fed either by a B. and B. or Amac carburetter, while a new type Bosch magneto is carried on a platform cast on the front of the crank case, and is driven by a train of gears. Handlebar control is used for both carburetter and magneto. The Roc type two-speed gear is employed in conjunction with an adjustable pulley. The left foot operates the high gear and emergency brake, while on the right footboard are placed the low gear and band brake pedals. Long rubber-covered footboards are fitted pivoted at their front ends and sprung towards the rear. The wheels are specially heavy, and shod with $2\frac{1}{2}$ in. \times 26 in. tyres. A new silencer and cut-out are used, and a plate is fitted over the end to protect the rider's trousers from the exhaust gases. All fittings are very substantial, and the front mudguard is fitted with side wings right up to the fork head. In the 1912 models the front wheel can be dropped away by removing two split pins and slacking off two nuts. As is usual on L.M.C. machines, a universal joint is fitted near the small end of the connecting rod, and a foot-operated exhaust lift is used as well as the usual hand lever. The spring up stand is prevented from rattling by a spring clip on the mudguard. B. and L. lubrication can be supplied. The 1912 T.T. and Tourist models have drop frames, and the front wheel is more readily detachable than previously. With these exceptions they remain almost unaltered. The engine has a bore and stroke of 85×88 mm., and the Autovaria gear can be fitted if desired.

4 h.p. L.M.C., with L.M.C. two-speed gear, made under Roc patents.

1912 Models.—

Bradbury foot starter, two-speed gear and clutch operation.

Bradbury.

The principal item of interest in the Bradbury models will be the well-tried two-speed gear. The following models will be marketed, all having the same sized engine, and differing only with regard to the gear employed: Two-speed chain-driven with Bradbury gear, two-speed belt-driven with N.S.U. gear, three-speed belt-driven with Sturmey-Archer gear, single-gear with belt-drive, and single-gear with Villiers free engine clutch.

We illustrate the new Bradbury two-speed gear and kick starter, the gear box being placed on the chain stays immediately behind the engine. The drive both from the engine to gear box and from gear box to back wheel is by chain. The gears are always in mesh, and are thrown into engagement with dog clutches, the top ratio giving a direct and the bottom an indirect drive. The clutch, which is arranged on the left-hand side of the gear box, is a very simple type, and consists of a metal-to-metal cone, which is operated from the handle-bar through a rod. This rod is connected to a crank carrying a quick thread screw, the nut for which is ormed by a bracket bolted inside the gear box. This quick thread screw

Toe and heel rocking gear pedal on the new Bradbury.

operates a plunger rod which passes through the primary gearshaft, at the further end of which the clutch is situated. The adjustment of this push rod can be controlled by a small grub screw, placed, as shown, concentrically in the quick thread screw.

The box is supported by a very simple form of bracket, by means of which it is readily removable from the chain stays: all that is necessary for this purpose being the undoing of five bolts and the disjoining of the engine chain and clutch rod.

The gear is lubricated through a sensibly large cap screwed into a special lug cast at the side of the gear box.

The kick starter consists of a semi-circular gear wheel, formed in one with a pedal crank, which is returned to its normally upright position by a helical spring wound round its supporting pivot. The semi-circular gear wheel meshes with a pinion carried loosely on the primary gearshaft and engaging with a couple of under-cut ratchet pinions. The engine is started by kicking the pedal downwards and backwards.

The control of the gear is by rocking pedal, this being placed on the rear side of the machine, and, although not formed integrally with the footrest, is nevertheless well protected by it. Both are carried in an extension lug from the side of the aluminium crank chamber, one of the best points of the arrangement being that in the event of a "spill" the footrest would

Bradbury new design double width mudguard and back number plate.

take all the brunt, and derangement of the two-speed pedal gear become very unlikely. The pedal gives the low gear when rocked forwards and high gear when rocked backwards. Free engine position is obtained midway, and is easily felt for, since the crank to which the gear control rod is fixed works over a quadrant and carries a plunger which engages with notches cut therein. This is shown in the second sketch. The engine chain is contained inside a quick detachable casing. Handle-bar control of the magneto is only

one of the refinements of the 1912 Bradbury.

The combined lamp and generator bracket has been thoroughly webbed for strength. A lubricating oil squirt intended primarily for use with the gear box is supplied. The foot brake is of commendably large size, and is arranged above the chain stay. This brake acts on a special belt rim spoked to the off-side of the back wheel. The rear mudguard, with its double extension, is fitted as a standard to all models, and contains also a combined number-plate and reflector tail light, which we illustrate on this page.

N.Y.E.

Nye and Co. will stage on Stand 62 the new Italian S.I.A.M.T. lightweight, a Triumph with Mabon two-speed gear on counter-shaft which will be shown as a working model driven by electrical power, a 6 h.p. Enfield sidecar combination, a Moto-Rève, a P.V., and a Stuart Turner two-stroke; the last two named have already been described in previous issues. In addition, a Polkey-Jarrott electric generator lamp set adapted for motor cycles will be on view.

Stuart drip feed lubricator.

Further P. and M. Details.

In our last issue we outlined some of the more important P. and M. improvements. We are now enabled to illustrate a few of the special details for 1912. The kick starting device consists of a semi-circular drum, at the corners of which are anchorages for a short length of chain, which passes over a small sprocket supported by a projection cast on the timing gear case. Internally this sprocket carries a ratchet free wheel with under-cut teeth, a similar ratchet forming the end of the engine-shaft. The under-cutting of the teeth prevents the two disengaging themselves so long as pressure be applied to the foot crank. The manner in which the free wheels are engaged is ingenious. Normally a short spiral spring holds them out of engagement, but on the crank is

Latest model 3½ h.p. two-speed P. & M., which now has a kick starting apparatus.

1912 Models.—

a U-shaped flat spring, the inner face of which, when the crank is pressed forward in order to start the engine, rubs against the end of a small sprocket, and in doing so forces it inwards, thereby engaging the two free wheels. A helical spring, not shown, is wound round the shaft on which the semi-circular drum is mounted, and when pressure of the foot is relaxed it returns the drum to its original position.

The new carburetter contains several improvements, notably the ready detachability of all parts, including the float chamber, the throttle and air slides;

P. & M. new design single jet carburetter with piston control.

the latter are depicted withdrawn from their tubes. The float chamber is formed with a concentric boss in which is turned a groove for the reception of a peg on the flat spring which holds it in position. Upon lifting the spring and turning it slightly sideways, the lid is free to be removed. Another item is the new P. and M. exhaust lifter, which consists of a short crank hinged to a projection cast on to the aluminium cover of the tappet guide.

The arrangement of the foot brake has been entirely re-designed, the pedal being now operated by the heel. The footrests also carry a very practical and neat front wheel stand. The magneto advance is now operated from the handle-bar. The bracket, which forms both the guide for the Bowden cable and an anchorage for the return spring, is bolted to the

magneto itself, from which it is rendered detachable, the fixture being an extremely neat and simple one. The other refinement is a petrol priming device. Owing to the inclined position of the cylinder, a specially turned-up compression tap is required, and in order to make this operation

Handle-bar controlled magneto advance of the P. & M.

P. & M. foot brake pedal.

easy, the cock-plug is considerably extended forward so that the handle of the cock does not foul the cylinder support. A short tube from the tank leads to the tap, the outlet being controlled by a screw-down needle valve. With regard to the 2½ h.p. lightweight, this will have the latest B. and B. carburetter and handle-bar control to the magneto.

Armstrong Gears.

A few days ago we were given an opportunity of thoroughly inspecting the manufacture of the Armstrong three-speed hub for motor cycles. Accompanied by Mr. Reilly (works manager), we made a tour of the splendidly equipped works, and one of the first things we noticed was the special machinery for cutting the pinions. A row of these machines has been laid down, and no drifting or broaching of the pinions is allowed in the manufacture of this gear. All the pinions of the Armstrong gear are milled, and subsequently gauged to a thousandth part of an inch. Our visit was of absorbing interest, and we feel confident that, equipped as the Armstrong Gear Co. is, no inaccurate part can issue from its works.

For next year a few slight alterations have been made, as the firm will market two types one called the Mark 2, which

is suitable for machines up to 3½ h.p. solo, and the other Mark 3, which is intended for 3½ h.p. sidocar machines. The latter model will have a slightly increased number of plates in the friction clutch, and they will be made alternately of phosphor bronze and steel. The total number of plates in this hub is fourteen, and the added weight 2 lbs. All the hubs before being sent out are subjected to an extremely severe test to prevent any possibility of clutch slip.

The best way to lubricate the hub is to disengage the clutch, and to lubricate on the clutch side with thin lubricating oil such as is employed for push

B.S.A. new Bosch magneto bracket and exhaust cut-out.

cycles. If this be done the oil will reach the clutch plates more readily.

At the Armstrong stand, No. 33, will be found sections of the gear and other interesting items.

Power plant of the 3½ h.p. P. & M., showing kick starter and gear control.

The 1912 chain-driven twin-cylinder Bat-Jap, showing method of operating the new pattern two-speed countershaft gear.

Bat.

As may be expected, the exhibit of the Bat Motor Manufacturing Co. will be an imposing one. The chief novelty consists of the sidecar machine, which is fitted either with a 5-6 or 7-8 h.p. J.A.P. engine.

In the first place, the transmission is by chain through a counter-shaft gear box of the sliding dog clutch type. Ball bearings are fitted throughout, and on the sprocket side of the driven shaft double ball bearings are used. The clutch is in the rear wheel, and is one of the internal expanding pattern. The expanding segments are made from the solid metal and are operated by means of wedges. Powerful spring coils pull these wedges into the splits in the phosphor bronze and expand the segments against the drum on the sprocket. Normally, therefore, the clutch is in engagement. To disengage the clutch the operating mechanism is put into action by means of inclined planes on the exterior of the clutchshaft. A ball bearing thrust is provided. The gears are changed by means of a lever on the top tube, surmounted by a wooden knot working in a quadrant. The clutch is operated by a pedal situated close to the rider's left foot. The attachment of the gear box is interesting. It is suspended on a slotted aluminium plate, webbed to add

to its strength, fixed in front to the rear end of the crank case and at the rear by stays running from the ends of the back forks. The engine chain is adjusted by sliding the gear box along the slots, and the back chain by the usual type of chain adjusters. A further improvement in this machine is the re-designing of the spring frame. It will be remembered that in the Bat spring frame both saddle and footrests are inter-connected. In the new type the moving portion of the frame is suspended at its lower end, forward of the crank case, and it will be seen from the illustration that there is ample provision for large footboards, which provide a very comfortable position. The movable portion of the frame is held on two powerful coil springs, which not only give to the road shocks but also take the rebound. One spring is carried on each side of the top tube. The spring forks have been slightly altered, and the girders are now brazed solidly to the lugs. Side shields are fitted to the front mudguards. A crossbar is fitted to the handle-bar to add to its strength, and for the purpose of carrying accessories. 650 x 65 mm. grooved Dunlops are fitted.

The engine, with its well-known magneto drive, remains unaltered, and the B. and B. carburetter is fitted in all cases. Altogether the machine is well designed throughout, and the finish is excellent.

The single-cylinder 3½ h.p. Bat continues to be fitted with the P. and M. gear, and the latest type control is now employed. On this the spring frame follows the 1911 lines, but a new and improved type of spring is used.

The Bat exhibit will include all the models the firm manufacture, including a new 8 h.p. T.T., 90 x 77½ mm., fitted with overhead valves, and a 5 h.p. T.T., 85 x

65 mm. In these T.T. models the magneto is carried low down in front of the engine.

Lincoln-Elk.

Kirby and Edwards will have a comprehensive exhibit of ten Lincoln-Elk machines at Stand No. 84. The model A is a 3½ h.p. machine fitted with the firm's own 85 x 88 mm. engine, Bosch magneto, B. and B. carburetter, and Druid spring forks. Palmer tyres are fitted, and this model will be supplied with the Lincoln-Elk two-speed gear and free engine, free engine clutch alone or fixed gear. The

3 h.p. model B has a 79 x 82 mm. engine and the same specification as above. The 2½ h.p. model C is a lightweight, 70 x 72 mm. engine, and is sold at a remarkably low figure. All machines are

The inside chain casing and magneto platform of the Trump-Jap is cast in one piece as shown.

manufactured complete on the firm's own premises. Visitors to the Show should not fail to inspect the new two-speed gear and free engine clutch, which are also made in the same factory and claimed to be novelties.

New design balanced Douglas crankshaft.

Horizontal section through the dog clutch gear on the Bat.

1912 Models.—

B.S.A.

The B.S.A. Company will list four models for the 1912 season. They are a roadster, a free engine, a two-speed, and a T.T. model. All these types will be fitted with the 85 x 88 mm. engine, which has undergone practically no alterations. A dropped top tube is now employed on the frame. Inverted levers are used for the brake and exhaust lifter, and the B.S.A. spring fork, which has given great satisfaction, is retained. The new type Bosch magneto is used, and the metal magneto cover fitted to this year's machine is dispensed with, as the efficient front mud flap protects the magneto from mud, while the construction of the new type Bosch guards against shorting by rain. The tank is similar to this year's, but a screw petrol tap is fitted, and the T.T. and two-speed models are fitted with Best and Lloyd sight-feed lubricators. In all types the new B. and B. carburetter is used. The front wheel can be detached by removing a central bolt on which the hollow hub spindle is carried. Pedalling gear is fitted to all except the T.T. model, and in this case it is replaced by a second pair of footrests. The foot brake is carried on a special lug. A new carrier has been evolved, having pannier tool-bags carried in metal pockets, which protect the ends, backs, and bottoms of the bags from mud splashed from the rear wheels. It will be remembered that the B.S.A. clutch, a sketch of which was published in a recent issue, consists of a double ended and double-faced cone gripped between corresponding side pieces. A new and very neat two-speed gear is fitted in the hub. It is small and light, but smooth and positive in its action. Its operation is as follows: The gear is of the epicyclic type controlled by a double-faced clutch, and is placed in the rear hub. Normally, the springs S

force the cone A into engagement with the corresponding cone B, which is splined to the hub shell H, thus locking the belt rim to the hub shell, and giving the high or direct gear. By depressing a pedal the rod K forces A out of engagement, and the gears revolve idly, giving the free engine position; but by further depressing the pedal the inner face of A is forced into engagement with the cone C, which is anchored to the frame, thus holding the sun wheel S (to which A is splined) from revolving, and causing the hub shell to be rotated through the planetary pinions P at a reduced ratio (in this case 38%).

From a short trial spin, we are satisfied that the gear is extremely simple to manipulate, and very smooth in action, and when once engaged we noticed no tendency to slip.

The Scott Two-stroke.

Although none of the modifications which will distinguish the 1912 Scott from that which has performed so creditably during the past season are very obvious, they are worthy of note, because they are the outcome of practical riding tests by the designer who has carried an original type to success.

1912 Scott two-stroke engine. The crank chamber and cylinders with water-cooled heads removed.

Foremost in interest naturally comes the engine. To start with the bore has been increased $\frac{1}{4}$ th of an inch and now measures 2 $\frac{1}{2}$ in. with a stroke of 2 $\frac{1}{2}$ in., the cubic capacity of the cylinders being 555 c.c. as against the previous 485 c.c. The cylinders themselves have been completely remodelled, and are now a wonderfully smooth casting from which all dirt catching nooks and crannies have been entirely removed. This is indicated by the first illustration, which shows a pair of cylinders without the water jacketed head, mounted on the aluminium crank chamber. The latter has a rounded front instead of the previous square section.

Section of the new B.S.A. two-speed gear. (See accompanying description.)

whilst it has been further strengthened by numerous reinforcing webs. Between the upper transfer port, which is on the side of the cylinder, and the lower transfer port, which is in the crank chamber, is a ridge of metal, which is machined to act as a guide for the transfer port covers and gauzes. It is, therefore, impossible to put these latter in any but

the right position, and choking of the port following upon their incorrect situation is thereby avoided.

The joint between the cylinder casting and the crank case is formed by machined cups in the last named, into which rings turned on the base of the former register, the packing being made by a narrow linen washer.

An exceedingly clever and thoroughly practical device has been introduced to take the place of the usual holding-down bolt, the use of which necessitated four pockets for the nuts in the side of the casting. Instead of the usual bolt is a shouldered stud, the smaller diameter of which passes through a lug on the side of the crank chamber, and is threaded for its bolt in the ordinary way. The larger cylindrical shoulder lies inside a blind hole drilled in the water-jacket casting, where it is held in position by a knob-headed pin. In order to remove the cylinders all that it is necessary is

The new Scott carburetter.

to slacken the underneath nuts to a slight extent, when the securing pins are withdrawn and the cylinders free to be lifted clear.

The carburetter has been remodelled. The second illustration indicates that the arrangement remains the same. All the air for the mixture is taken past the jet (except that which may in special circumstances be allowed to enter through the jet cover), and it all comes from the space between the crank chamber walls, where it is not only warmed but free from dust. An automatic valve with an air cylinder dashpot controls the main air admission, and to allow for additional air adjustment the whole of this valve with its circular brass seating can be lifted to a certain extent above a second seating, this movement being accomplished by a screw action and operated by the lever shown on the right of the sketch. The spring against which this lever works is contained within a closed brass cylinder, fixed on the near side of the air valve drum, which effectively shields it from dust, dirt, and water. A similar cover is used for the throttle sleeve.

Scott two-speed gear, showing one of the drums and its expanding clutch

1912 Models.—

The new Triumph T.T. roadster, the improvements in which were enumerated in our last issue.

The throttle valve consists of two concentric sleeves moving in opposite directions and giving a central cut-off immediately behind the jet. The moment the throttle is closed two air ports come into register and deliver fresh uncarburetted air to the inlet pipe. This air is also drawn from the crank chamber, the ports (the top of which can be distinguished in the sketch) opening out into a cast-in duct which leads thereto. The sleeve and handle controlling the jet cover have been strengthened as shown.

Not only has the appearance of the engine been made neater by the hiding of the carburetter control springs, but a further effect in the same direction has been gained by having the control cranks pointing downwards, the Bowden wires to which they are attached being anchored in special lugs cast on the crank chamber (see sketch on previous page). The extra air valve and its seating can readily be removed by slackening the nut on the side of the drum which is partially split for locking purposes.

The Scott detachable spring footboard (shown upside down).

Turning now to the two-speed gear, this has been entirely re-designed and now runs on four large diameter ball races with 9.32in. diameter balls. Apart from this point, however, the wedge action, which is used to expand the hardened steel clutches, has been considerably improved, and is now so easy to operate that either gear can be put in (and will remain in) with the pressure of a finger. The sketch on the previous page illustrates half of the gear, showing the wedge action. The ends of the expanding rings are inclined towards one another, and into this converging gap are thrust a couple of hardened steel rollers supported in a cage. The peripheries of these rollers bear together, and as they roll upon one another the friction in producing the expanding action is very slight indeed. Their housing is carried by a sliding ring keyed to the

centre spindle and operated by an internal push rod. The drive between the spindle and the expanding ring is, however, not taken through the wedging

Detachable number plate. The lower separate fork

front guard and of the new Scott. sketch shows the attachment.

rollers but through a tongue made integral with the sliding ring, which engages with a key slot in the expanding ring. (In the sketch this tongue and slot are shown at the bottom of the clutch and the roller-wedge at the top.) The expanding clutches are fitted with specially hardened end pieces, and are ground perfectly cylindrical, so that their pressure of contact with the outer drum is uniform around their periphery.

Valve side of the 1912 clutch model 7 h.p. Indian.

Sidecar attachment lugs are brazed to the frame at the steering head and also immediately in front of the back axle slots. The down tube, which forms the oil tank, has been increased in diameter, and the filler placed lower down, so that spilling out of the back tube is impossible.

An excellent point is that the spring footboards are now made completely and almost instantaneously removable (see sketch). In the rear the footboard is supported upon a sprung D tube, to which it is secured by a spring latch and a couple of claws on a brass lug. In front it is supported and also suspended by a single leaf spring which slips on to the end of the cross tube. It will be seen that, although the boards are detachable—a very handy thing in cleaning or adjusting—the machine can be safely leant upon them, as they cannot shift in an upward direction.

Amongst other minor improvements are: Petrol tank increased to two gallons capacity; adjustment of automatic oil-feed made quicker and self-locking; recessed pannier tool-bags in carrier; side wings of curved form, die-stamped, and therefore quite rigid (these protect the front of the engine completely and are fitted with a bright stout aluminium beading which will stand any amount of scraping, etc., and look little the worse for it); larger diameter back wheel bearings, stronger spokes, and heavier rims; chain guard covers entire upper part of chain; enclosed magneto; shorter wheelbase (this is now 54in.); kick starter put forward of back axle, so as to be independent of driving chain adjustment.

Altogether the 1912 Scott will be in general considerably nearer perfection than the 1911 model, and this is high praise indeed. We are informed that the past somewhat restricted output is to be doubled next year.

E.L.I.

The E.L.I. Motor Mfg. Co., Bristol, will show at Stand 54 an example of their motor bicycle which is named the E.L.I. The machine has a Precision engine. The same exhibit will also include a Superbe sidecar with sprung axle and special luggage carrier, several samples of a new registered spring front fork, a provisionally protected sidecar stand, and the E.L.I. mudshields.

1912 Models.—

The 1912 T.T. model Ariel, which now has a dropped frame.

Matchless.

Messrs. Collier and Sons will exhibit ten Matchless motor bicycles and two sidecars, also C. R. Collier's famous red 7 h.p. racer, on which he has made world's records for the kilometre, mile, and five miles. The lady's 2½ h.p. m.o.i.v. is fitted with a three-speed gear, and the engine is vertically placed in a new open frame. The following men's machines will be on view: A 3 h.p. twin, m.o.i.v., 60 × 76 mm. engine; a 3½ h.p. single-cylinder, 85½ × 85 mm., m.o.i.v., free engine clutch; a similar machine with three-speed gear; a 5 h.p. twin, 85 × 65 mm., overhead valves, fitted with the Matchless six-speed gear, as used in the T.T. races; a 6 h.p. twin, 76 × 85 mm., m.o.i.v., with free engine clutch hub, and special touring equipment. In addition to the above there will be six standard models fitted with the latest ball bearing Bosch magnetos, spring front forks, adjustable pulleys, stands to both wheels, number plates, bags, and tools.

The principal improvements introduced by Messrs. Collier are the six-speed gear already referred to, stronger mudguards with metal side shields to front wheel, and back mudguard fixed without stays.

The Matchless engine will make its first appearance. Several notable improvements will be noticed in this engine especially the timing gear, valve lifting mechanism, and compression taps, whilst all running parts will be absolutely inter-

changeable with the J.A.P. engines, which Messrs. Collier have previously used so successfully. The adjustable pulley has a positive locking arrangement.

twin 76 × 85 mm., at 8 h.p. twin 35 × 85 mm., and a 4 h.p. single-cylinder 35 × 85 mm. The back wheels of the sidecar machines are fitted with 650 × 65 mm. voiturette tyres, and the front wheels with extra heavy 26 × 2½ in. non-skids. Lubrication in the case of all these machines is by J.A.P. automatic lubricator and auxiliary hand pump. Mud shields are fitted over the belt rim, and the front wheel can be quickly detached by means of a hollow spindle. The two-speed gear and clutch is in the back hub and operated by two pedals which prevent any possible mistake being made in changing gear. A racing model will also be on view fitted with an 8 h.p. twin-

New design fork and front brake stirrup on the 1912 Triumph.

New model ladies' Matchless-Jap, with three-speed gear.

P.M.C.

The Premier Motor Co., Ltd., Birmingham, will exhibit, in addition to the Rex-Jap, illustrated last week, several De Luxe models specially designed for sidecar work. Among them are a 6 h.p.

cylinder J.A.P. engine. The P.M.C. Motorette will, of course, be staged.

A.C. Sociables.

For next year two types of the A.C. sociables will be manufactured—the Standard and the De Luxe. An improved form of two-speed gear has been introduced, the design of which is exceedingly neat, even the brakes with which the changes are effected being enclosed. The new gear control is by two pedals, that on the right when pressed down engages the low gear, and when up allows the high speed to come into engagement. The left-hand pedal controls a ratchet brake, and when pressed down releases the clutch before applying the brake. The steering tiller is now hinged direct to the steering column, which turns on ball bearings, and all steering connections are of the ball and socket type. The stub axle pivots are provided with a ball thrust beneath, and an oilproof and wet-proof central pivot steering is provided, which includes front wheel brakes of the external type, the wearing parts of which are interchangeable with the gear brakes. Sankey detachable steel artillery wheels will be fitted both to the front and rear.

New model 2½ h.p. T.T. m.o.i.v. Douglas with two-speed gear.

New Sturmey-Archer Three-speed Gear.

A combined hub gear and clutch of great ingenuity is being placed upon the market for 1912 by Sturmey-Archer Gears, Ltd., Lenton, Nottingham. The device is conceived on quite original lines, and as will be seen possesses certain advantages, among the most important of

second sun-wheel J can be looked to the drum A in a precisely similar manner, and by means of dog clutches cut on their faces, the two sun-wheels G and J can also be locked together.

The high gear, in which none of the pinions transmit any power, is obtained by locking one sun-wheel J to the ring A and the other sun-wheel G to the ring H. At the same time G is locked to the sun-wheel J. The whole of the hub, therefore, revolves solid. To obtain the second speed, the sun-wheel J is locked to the hub spindle. In this case the driving pulley A, to which is spoked the belt rim, drives the ring B, which carries round with it the planetary pinions CC. These take round with them the ring D, which drives the flange H directly through the

The change-speed lever and quadrant on the top tube. In the forward position shown, the low gear is engaged.

clutch is accomplished by means of a quick-thread drum operated by a pedal.

The gear is changed by a lever on the top tube working in a notched quadrant, the lever contains a small wedge-shaped spring plunger. When the lever is pulled right back the gear gives the direct drive; in the middle notch the second speed, and in the position shown in the sketch the lowest speed. Between the

second train locked solid.

The Low Gear Action.

To obtain the lowest gear both sun-wheels are locked to the spindle, then the ring A drives the ring B, which carries with it the planet pinions CC, which accordingly revolve the ring D exactly as before, there being a fifty per cent. reduction be-

The quick thread drum and clutch-rod.

tween A and D. D, however, is in one piece with the ring E, and as this rotates the planet pinions FFF follow it round and roll upon the fixed sun-pinion G. In doing so they carry round with them their bracket H, from which the power is taken to the clutch.

Ingenious and Simple.

The operation of the gear is carried out entirely by means of the two sun-pinions, which are arranged in a very ingenious manner, so that they perform their three functions at three different positions along the hollow spindle. An intermediate free engine position is provided between the direct drive and the second gear, but this is only incidental, the clutch being used for this purpose in the ordinary course of events. A free wheel clutch is fitted outside the hub shell, and allows the engine to be started by pedalling with the wheel on the road. The second illustration shows the internally-grooved outer hub and two of the clutch discs, of which there are forty-one, made alternately of phosphor-bronze and steel. The operation of the

The clutch pedal which remains in the "out" position until the heel of the pedal is pressed.

top and second gear notches is a half-notch which represents the free engine position which has already been mentioned. This notch is provided for the purpose of adjusting the controlling rod. The clutch pedal is furnished with a neat ratchet device which allows the clutch to be locked either in or out. When the clutch is disengaged by pressing the pedal forward with the foot, the ratchet automatically comes into operation and holds the clutch in its "out" position. Upon pressing the heel of the hinged pedal the ratchet is disengaged until the pressure is released.

A 1912 P. & M. IMPROVEMENT.

Details of the new P. & M. foot starter. The crank is pressed forward, the small chain wheel being mounted on the half time shaft.

The Sturmey-Archer three-speed hub gear shown with gearing withdrawn from the hub shell.

which may be mentioned the fact that upon the highest gear the power is transmitted direct, the two lower speeds both being indirect. This allows the use of a large diameter engine pulley. In addition to containing a multiple disc clutch, the hub comprises two separate, but inter-connected, trains of epicyclic gearing. The top gear being direct, the second drives through one train of epicyclic pinions, and the lowest through both trains. Reference to the first illustration, which shows the gear portion of the hub withdrawn from its shell, will make the arrangement clear. The hollow spindle is a fixed one; running on it on ball bearings is the hub A of the spoked belt rim; the spokes are shown dotted. This hub is integral with the epicyclic drum B, which also runs on ball bearings. Meshing with the internal teeth of B are four planet pinions CC, which revolve loosely on pins fixed to the carrier D, which, in turn, forms part and parcel of the second epicyclic drum E. This last again has four internal planet pinions FFF which mesh with a sun-pinion G. The planetary pinions CC mesh with a similar sun-wheel J, and both of these sun-wheels are capable of being locked in turn to the driving ring H, the flange

The S.A. hub shell and two of the clutch plates.

of which is recessed to engage with the driving members of the multiple disc clutch. The locking between H and G is effected by an internally-toothed ring, the teeth of which, like the teeth of G, are backed off in a very special manner to facilitate very rapid engagement. The

The *Motor Cycle* report of the Olympia Show. The descriptions will be written and illustrated by our own staff of experienced motor cyclists after a stand to stand inspection of the exhibits.

This Issue.

To-day's issue, the second of our Show specials, contains advance descriptions and illustrations of a number of 1912 models, the majority being exclusive to this journal. From a study of the pages, a reader may gain an insight into the new departures in next year's design of motor cycles before the opening of the Show.

1912 Improvements.

Alterations in 1912 pattern motor cycles generally are not sweeping, the improvements being confined mostly to detail work. The "kick" starter, the change-speed gear, brakework, and sprung pan seats have made the most headway.

The Number of Motor Cycles.

From *The Motor Cycle Buyers' Guide* it will be seen that there are 323 different patterns of motor cycles on the market, of which 215 are single-cylindered motor bicycles. Below we give the percentages of the various types of mounts:

	Number.	% of total.
Single-cylinder cycles	215	66.6
Multi-cylinder cycles	62	19.2
Passenger machines	12	3.7
Ladies' machines	12	3.7
Sidecar combinations	22	6.8
	323	100.0

Tied Houses in the Tyre Trade.

The A.A. and M.U. has addressed a letter to its officially appointed agents and repairers throughout the United Kingdom drawing attention to the action of a firm of tyre manufacturers who have inserted a clause in their agreement to the effect that retailers of their tyres under exclusive arrangements shall not hold tyres of any other make on sale or return. The A.A. and M.U. committee expresses a hope that firms holding its appointments will not enter into any such contract, giving as the reason that the arrangement is inimical to the interests of its members in that the proposed arrangement is practically an attempt to create tied houses in the tyre trade, and it feels that the Association's appointment should not be granted to firms whose power to cater for the various needs of its members is so restricted. The above is of interest to motor cyclists, as undoubtedly the clause in the agree-

ment would apply to motor cycle tyres, and although the Manufacturers' Union has decided to adopt a standard size of tyre rim there are thousands of motor cycles in use with rims of various sizes.

Australia's First Motor Show.

This show, which was a great success, concluded, last month, with a gymkhana. The motor cycle events were as follows: Tilting at the Ring.—1. R. Readford (5-6 h.p. F.N.); 2. A. C. Searl (5 h.p. B. and B.-Jap).

Novice Race.—1. W. Meldrum (3½ h.p. T.T. L.M.C.), 45 yards; 2. W. Miller (3½ h.p. L.M.C.), 50 yards.

Obstacle Race.—1. R. B. Archer (5-6 h.p. F.N.); 2. A. C. Searl (5 h.p. B. and B.-Jap).

Speed Race.—1. A. Levi (3½ h.p. L.M.C.); 2. R. Robinson (3½ h.p. T.T. Speedwell).

Lifebelt Race.—1. J. E. Yee (3½ h.p. T.T. Triumph); 2. A. C. Searl (5 h.p. B. and B.-Jap).

Potato Race.—F. Holmes (3½ h.p. T.T. Speedwell); 2. R. B. Archer (5-6 h.p. F.N.).

SPECIAL FEATURES.

GUIDE TO THE SHOW.
NUMEROUS ILLUSTRATIONS AND DETAILS OF 1912 MODELS.

T.T. SILENCERS.

COUNTER-SHAFT GEARS AND
VARIABLE PULLEYS.

O. C. Godfrey Convalascent.

We received a letter from Mr. O. C. Godfrey on Tuesday last which shows that he is back at business once more. He tells us that he has every hope of being well enough to attend the Show. The winner of the Senior T.T. wishes to thank all the kind friends who made enquiries as to his progress while at the Hampstead Hospital, as he finds it quite impossible to write to them all.

An Easy Road out of Lynmouth.

Commenting on an article in *The Motor Cycle*, "Kuklos" writes as follows in *The Daily News*: "A capital road leads into Lynmouth (or out of it) by gradients so easy that they present little difficulty to the bicyclist and none to the auto-cyclist of any power whatsoever. It leaves Lynmouth between the two horrors referred to, winds easily and beautifully up the Watersmeet Valley as far as Hillsford Bridge, where it breaks away from the Brendon and Oare Road, turns right and north over the 'new motor road,' and climbs with only one sharp pitch to Simonsbath, on Exmoor. There you either turn right and west for Challacombe, Blackmoorgate, and Ilfracombe or Barnstaple, of left and east for Exford, Wheddon Cross, and Exeter or Minehead or Taunton. The latter is the way to Lynmouth for all those ordinary autocyclists who are not out to ruin their tyres or twist their frames." "Kuklos" adds, "It goes nowhere near the Doone Valley, where there is no road at all." Perhaps the Uxbridge motor cyclist who regularly uses this road will enlighten "Kuklos."

The 3 h.p. Rollo tandem-seated quadcar, which weighs 4½ cwt. The transmission is by silent chain and two Whittle belts. This machine will be further described in a future issue.

British Imports of Motor Cycles.

The Board of Trade returns show that the imports of motor cycles for the month ended October 31st for the last three years were as under:

	1909.	1910.	1911.
Motor cycles—			
£	£	£	£
3,221 ...	1,390 ...	1,709	
Parts thereof—			
3,014 ...	4,559 ...	3,018	
Total—			
£6,235 ...	£5,949 ...	£4,727	

For the ten months ended October 31st for the three years the figures were:

	1909.	1910.	1911.
Motor cycles—			
£	£	£	£
35,364 ...	40,655 ...	37,739	
Parts thereof—			
24,027 ...	47,032 ...	54,847	
Total—			
£59,391 ...	£87,687 ...	£92,586	

British Exports.

The exports of British-made motor cycles for the month ended October 31st for the last three years were as follows:

	1909.	1910.	1911.
Motor cycles—			
£	£	£	£
9,295 ...	15,906 ...	33,020	
Parts thereof—			
2,552 ...	2,847 ...	7,844	
Total—			
£11,847 ...	£18,753 ...	£40,864	

For the ten months ended October 31st our exports are represented by the figures hereunder:

	1909.	1910.	1911.
Motor cycles—			
£	£	£	£
46,945 ...	93,346 ...	198,293	
Parts thereof—			
26,722 ...	32,063 ...	56,568	
Total—			
£73,667 ...	£125,409 ...	£254,861	

From the above statistics it will be seen the exports for the ten months of 1911 are just over double what they were for the corresponding period of 1910, and nearly four times the amount in 1909.

A.C.U. Notes.

Subject to confirmation by the General Committee of the Auto Cycle Union, the Competitions Committee has decided that the dimensions of the engines to be used in the 1912 Tourist Trophy Races shall be as follows:

SENIOR T.T.—Capacity limit up to 500 c.c. (viz., Class C) for any type of engine; that is to say, for single and multi-cylinders or two-strokes.

JUNIOR T.T.—Engine dimensions to be up to 350 c.c. (Class B) for any type of engine. Race to be held one day in June or September, according to when permission can be granted by the island authorities. Every effort is to be made to get this date settled at the earliest possible moment. Naturally it depends upon permission being granted whether or not the race will be held in the Isle of Man, and consequently in this preli-

iminary announcement no idea of a definite date can yet be given.

As regards the two one-day trials. The Spring trial is to be held on March 2nd over a course to the south of London. The Autumn one-day trial will be held on October 26th over a course in the Midlands. The regulations governing these trials will be discussed at a meeting of representatives of the A.C.U. and the Motor Cycle Manufacturers' Union.

SIX DAYS' TRIALS.—It has been decided to hold these from the 12th to the 17th of August, radiating from a centre which has not yet been settled.

LAMP TRIALS.—The A.C.U. considers with favour the holding of a lamp trial during the winter, and the matter will be placed before a joint committee of the A.C.U. and the Motor Cycle Manufacturers' Union.

A permit has been granted to the North-west London M.C.C. to hold an open winter run to Gloucester and back on December 30th.

Abandoned.

The Auto Cycle Union inter-club championship, and also the annual race meeting, are to be dropped. The former event was instituted in 1910 when the Coventry and Warwickshire Motor Club won, this year the Oxford M.C.C. proved victors.

Latest design Lea-Francis warning triangle, fitted with Lea reflex lights in the corners. It would be well if some such lighting device were compulsory. This and other reflector warnings will be exhibited at Olympia.

The Motor Cycle in Canada.

The pastime is gaining favour in Canada, and it is estimated there are 600 motor cyclists in Toronto alone. The Toronto M.C.C. at their last meeting decided to affiliate to the Federation of American Motor Cyclists.

40,000 Miles in Forty Weeks.

It should be noted that Harry Long's ride of 40,000 miles on a free engine Triumph occupied only ten months, although, as the ride began in January and finished in November, eleven different months came partly into the total time.

Railway Facilities to Olympia.

The London and North-Western Railway Co. have consented to grant special cheap bookings to London, on Wednesday, November 22nd, from Stafford, Rugeley, and Lichfield. The train leaves Rugeley 7.57 a.m., and returns 4.5 o. 5.35 p.m. from Euston. Return fare 7s. 6d.

Speed Limits in Sussex.

The Sussex County Council have made application to the Local Government Board for a ten miles speed limit over a considerable area of road at Petworth. The A.C.U., R.A.C., and Legal Departments, being of opinion that some of the roads comprised in the application do not necessitate any such limit have given notice of opposition. The L.G.B. inquiry will be held on December 2nd at 11 a.m. at Petworth. Motor cyclists acquainted with the district should communicate with the secretary of the Union, Mr. F. Straight, R.A.C. Buildings, Pall Mall, S.W.

Meeting of Club Secretaries.

The committee of the Auto Cycle Union has convened a meeting of hon. secretaries of clubs to be held in the Press Room, at Olympia, during Show week on Saturday, 25th inst., at 6.30 p.m., for the purpose of arranging dates of events to be held during 1912. Hon. secretaries are, therefore, requested to bring the question of next year's events before their committees in order that they may attend this meeting with a list of such events, together with the suggested dates. At the conclusion of this meeting, a discussion will be held on the relations existing between the Auto Cycle Union and the provincial clubs. Owing to the limited capacity of the Press Room, clubs will only be entitled to send one delegate, and it is recommended that he be either the hon. secretary or the chairman of the club.

The Army and the Motor Cycle.

It will be remembered that some time ago the Auto Cycle Union submitted a scheme to the Army Council for the provision of a number of motor cyclists in cases of extreme emergency. Nothing much has been heard of the matter since, but an advisory committee, consisting of representatives of the War Office and the Auto Cycle Union and the Automobile Association, have held many meetings to draft and prepare a scheme likely to be acceptable. This scheme has now been completed, and as soon as finally approved by the Army Council will be published. Interested readers can leave their names and addresses at Stand No. 172, Olympia.

SOME SIDECARS FOR OLYMPIA.

Millford Sidecars.

Mills and Fulford will exhibit at Stand 65 examples of all their Millford sidecars. These will be found suitable for all pockets, as their range of designs starts with a very low-priced sidecar called the Herald, the most expensive one embodying all the latest ideas such as the radial castor wheel, with spring wheel and coach-built body. Among the other designs which will be exhibited are the rigid Millford sidecar with several distinctive designs of chairs in cane and wickerwork. Several will be specially made to enable a child as well as the passenger to be carried. Among the refinements which will be found on these up-to-date sidecars for 1912 are wind screens, luggage carriers, petrol carriers, etc.

In the new models it is now possible to bring both sidecar wheel and motor bicycle wheel absolutely parallel. This is provided for by all-round adjustability, which allows the sidecar to be lined up with the bicycle in any direction, both vertically and horizontally. Wicker and cane chairs with side doors will be quite a feature of the Millford sidecars for next year, the very latest type with torpedo-shaped front and side door being exceptionally taking in appearance. The side-door type of sidecar will be extremely popular next year, as with it all trouble of buttoning up and unbuttoning the apron is obviated. At present few sidecar passengers can leave their seats till the driver has dismounted and unbuttoned the apron at the top and bottom. With side door the passenger can descend whilst the driver remains seated, often a great convenience.

Gloria Sidecar.

The Gloria sidecar has been designed to meet the demand for a high class attachment for a motor cycle. The patent spring wheel suspension insulates the passenger from road shocks, and the makers claim that it imparts a free trailing movement to the wheel, so that there is no binding or dragging action.

The quick attachment method is designed as follows: The head attachment, instead of being a fixed clip to the down tube of the motor cycle, is connected at the head to the top and bottom frame tubes by means of two clips clamped to the framework and connected by a steel spindle, which also carries an arm for coupling to the sidecar connecting tube. The bottom clip has a swivel joint which enables the device to be adjusted at any angle to suit various makes of machine. The rear attachment is in the same form, the clips clamping to the rear and chain stays. The patent attachment described above is suitable for Matchless, Rover,

Triumph, L.M.C., and Bradbury motor cycles, and for those for which it is not suitable a single tube clip method of attachment can be supplied.

Three sidecars will be shown fitted respectively with standard cane body, coach body, and cane torpedo body. A fourth one will be a special registered design, and will be fitted with cane torpedo body and accommodation for petrol tank and small touring trunk. This last was illustrated last week (see page 1199).

Millford spring-wheel sidecar with latest form of cane chair with rolled front and side door.

Montgomery Sidecars.

On Stand No. 60 in the Annexe will be shown a full range of the well known Montgomery castor wheel, spring wheel, and rigid sidecars, which have been practically redesigned for next season. One of the features of these sidecars is a patent spring under the foot of the chair, which greatly adds to the passengers' comforts. The Montgomery patent attachments are provided with a security device which prevents the connections working loose, and stands are being fitted to support the car when it is detached from the bicycle; it also facilitates tyre repairs. All except the cheapest model have luggage carrier, petrol carrier, and tool box embodied in the construction of the chair. The castor wheel frame has been considerably

strengthened in view of it being used on high powered machines. A new model will be introduced at the Show with sprung frame, but of lighter construction than the 1911 pattern, and for use with standard $3\frac{1}{2}$ h.p. motor cycles. A patented method will also be shown for bringing the sidecar axle in line with the driving wheel of the motor bicycle. Sections of the sidecar hubs, axles, ball races, cups, etc., will be on view. The aim of W. Montgomery and Co. is to make sidecars for use on long journeys, and particular attention is paid to the comfort of the passenger both in seating and springing and protection from the weather. Luggage carrying capacity, general convenience, and ease of steering have all been carefully considered. This exhibit will comprise one of the most representative displays in the Show.

The Bradbury Sidecar.

Improvements have been made in the Bradbury sidecar, the first of which relates to its fittings. The lug, which is fitted to the down tube of the bicycle frame, terminates in a cone which fits into an internal cone machined in the sidecar bracket. These cones relieve the security bolt of all direct strain, and form a very neat and quickly detachable device. In the sidecar itself special attention has been paid to accommodation for luggage and tools, the vehicle being exceptionally well provided in this respect, there being

Quickly detachable sidecar fixings on the latest Bradbury.

first a D-shaped basket clipped to the back of the seat, a flat box underneath the cushion, a shelf inside the torpedo front, a deep and commodious pocket in front of the passenger's seat, and a couple of small baskets on each side of the chair, situated under the elbow rests.

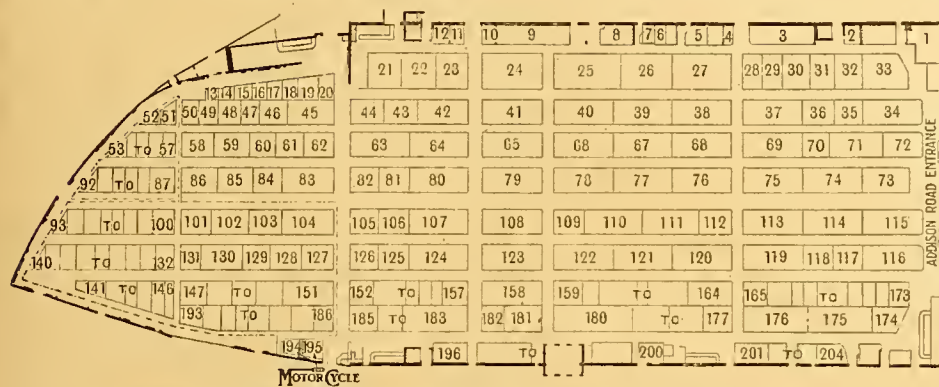

Chassis of the Chater Lea standard sidecar, which has quickly detachable joints.

OLYMPIA.

LIST OF MOTOR CYCLE EXHIBITORS WITH PLANS OF THE STANDS.

BELOW will be found a complete list of exhibitors of motor cycles and accessories at the second annual exhibition of motor cycles and cycles, with their stand numbers. The approximate position of any exhibit may be traced by reference to the reduced plans of the Show stands in Main Hall and Gallery. The exhibition will be open each day next week from 10 a.m. to 10 p.m. Readers journeying by train should alight at Addison Road Station.

Numbering of the stands in the Main Hall and Annexe at Olympia. For guide see accompanying list.

ACCESSORIES OF THE SHOW

John Bull Tyres.

The Leicester Rubber Co. will exhibit at Stand No. 151 the John Bull motor cycle cover. This cover has a cross-grooved tread and is made by a new process by which it is subjected to great compression during vulcanisation. This has the effect of making both tread and foundation absolutely inseparable. The cover is claimed to be a perfect non-skid without the disadvantage of throwing extra strain on the beads. The same firm will exhibit a motor cycle belt under the same name as the cover.

A new pattern Brooks-Triumph saddle for 1912, with anatomically shaped seat and springs in tension and compression.

Dover Specialities.

The Dover exhibit will be at Stand No. 264. The celluloid motor cycle foot pump is the standard pattern, 18in. long by 3in. diameter, fitted with a sprung in the handle, which makes it suitable for use with brazed-on clips. The foot piece is formed from sheet steel, and the portion that connects the foot piece to the barrel of the pump is also arranged to take the connection; this effects a slight saving in the weight and makes a very firm fixture.

The Dover handle-bar grip has a rounded back portion, enabling the fleshy part of the palm of the hand to fit comfortably, and the enlarged front of the grip enables the first finger to be placed in front of this excrescence without fear of the hand slipping backwards.

Dunlop.

For 1912 the central rib of the Dunlop tread has been replaced by a row of rubber studs, making three rows altogether. This triple-studded tyre is made in two weights, light and heavy, and while the heavy type will carry a 5 h.p. engine and sidecar, for higher powers light car tyres, grooved or steel-studded, are recommended for the driving wheels. The ordinary ribbed pattern, in wired-on and beaded edge covers, is retained, and if a cheaper tyre be required, the Warwick motor cycle tyre will be found to be excellent value at the price. Butt-ended as well as ordinary inner tubes will be shown, also the Dunlop motor cycle belt, which has been used by several successful competition riders this year, notably by Harry Martin on the track and Sam Wright on the road.

(Continued from page 1184, Nov. 9th.)

Speedometers and Watches.

The firm of S. Smith and Sons will be exhibiting on Stand 265 the well-known Smith speedometer for motor cycles which was introduced in the early part of this year, during which time it has been most successful. One of the latest models will be shown in combination form, with an excellent watch in a case over the top of it forming a part of the speedometer case.

In addition to the above there will be shown the Smith "Goldenlyte" motor cycle lamp with gilded lens mirror, intended to be supplied with gas by the "A.L." generator, one of the simplest types of motor cycle generators known. This has been slightly improved by the addition of a bracket at the side, allowing it to be fastened on to the usual combined lamp iron and generator holder.

Good motor cycle watches are often hard to obtain, and it is interesting to note that this well-known firm of watch makers has introduced two or three types of well-made handle-bar watches, fitted into cases which can only be opened by means of the owners' keys.

Among the other interesting exhibits shown by S. Smith and Son will be a well-made handle-bar mirror, which is provided with an exceedingly ingenious universal clip. This clip allows an absolutely universal movement and is secured merely by screwing up one nut. The portion which clips on to the handle

bar and controls the up and down and the lateral movements of the mirror itself is controlled, as regards the clip by tightening it, and as regards the mirror by pressing the ball into the cone which engages with it on the clip.

Jones Speedometer.

Markt and Co., on their stand No. 223, will exhibit the three famous types of Jones speedometer, which have been eminently successful from the first time they appeared on the market. These types, we may remind our readers, are: Model 32 with maximum hand, Model 31 without maximum hand, and Model 26.

A simple form of valve spring lifter sold by H. Terry & Sons.

which is slightly cheaper than the others. All these models are supplied with trip mileage recorders. The chief innovation for 1912 will be the rear wheel drive for the speedometer. Markt and Co. will also show the Veeder motor cycle cyclo-meter, alarm bells for lightweight motor bicycles, and the Goodlad speed indicator, an instrument which is sold at a good deal cheaper price than the Jones.

Continentials.

The Continental Tyre and Rubber Co., Ltd. (Stand No. 163), have a variety of models which are to be retained for the coming season, amongst which we may mention the standard type, which is of the ordinary corrugated form and tread, suitable for small powered machines; the "Modèle de Course," which is now far more substantially made, and is suitable for medium powered machines; the basket pattern non-skid tyre, and a model similar to the latter, but made extra heavy; a combination rubber and steel-studded tyre, and the "Autobi" basket pattern and steel-studded types for high powered sidecar machines.

The Continental Tyre Co. are introducing a new tyre cover made especially for Indian machines.

Continental tyres have been extremely successful during the past season, as machines shod with them won both T.F. races, and on Brooklands track and elsewhere numerous successes have been gained.

Smith's combined speedometer and watch for the handle-bar.

Accessories of the Show.—**Gorton Tyres.**

The new Gorton motor cycle tyre, the pattern on the tread of which gives the effect of the studded pattern, will be found on Stand No. 169. The studs are of such a shape as to overcome the difficulty of rapid wear. In the new pattern the studs are elongated, so that they withstand the wear considerably better. The same firm will also show two other qualities of motor cycle tyres in cheaper grades.

Clincher.

Thanks to the instalment of a new physical and chemical laboratory, considerable improvement may be anticipated in Clincher motor tyres in 1912, and the North British Rubber Co. may be expected to have several new models for the coming season. Such well-known types as the A Won have been improved and strengthened, while the rubber studded pattern is now made more substantial, and the famous "Dreadnought" cover will be retained. Various types of Clincher tyres are also made suitable for lightweight machines. The above are only preliminary details, and further improvements will be notified in our report of the exhibits.

Lycett's new pan seat.

A Leather Mudshield.

Beard-Brown and Co., Northampton, will show at Stand 261 the "College" patent leather mud-shield, which protects magneto, engine, and rider. The shield is made from leather, which is enamelled both sides, supported at the top by a metal rod, this is inserted through a small aluminium lug, which can be instantly attached to the top tube of the machine. To prevent heating of the leather a metal protector is supplied at the bottom, and adjustment is obtained by means of a leather strap. It is suitable for most standard makes of machines.

Lubricating Oils.

The Vacuum Oil Co., Ltd., will be showing on Stand 226 samples of the numerous oils and greases which bear a world-wide reputation. Among these we may mention T.T. Mobiloil, introduced in the early part of this year. This is a fatty compound lubricant, which has been supplied to the best known makers, and with this oil it is claimed that there is less tendency to carbonisation. The best known oil for air-cooled engines made by this firm is Vacuum P.

On Stand 266, C. C. Wakefield and Co. will be showing samples of Castrol, the lubricant for air-cooled engines of which they make a speciality, on which many successes have been gained during the past season. Machines finishing first, second, and third in the Senior T.T. Race used this oil.

1912 Lucas lamp and generator set.

On the stand of Price's Patent Candle Co., Ltd., No. 210, there will be on view samples of the various oils and greases which have made this firm pre-eminently famous in the motor cycle world. The well-known "Huile de Luxe" is now sold in two grades. The present form is retained for use in the winter time, while the new grade, which is a good deal heavier, will be more suitable for use in the hot weather. A speciality will be made in 1912 of castor oil and various compounds of castor oil for racing machines.

Bowden Control.

There are very few motor cycles which do not make use of the Bowden method of control either for magneto, carburetter, gears, or some other portion of the mechanism. Magneto control from the handle-bar will be a very popular feature next year, and this method of control is now standardised and will be exhibited made suitable for 1910 and 1911 Triumph, Rudge, Bradbury, and Clyno machines. An adaptable type for other machines will also be on exhibition. A new and useful fitting is the Bowden exhaust lifter hold-up or clip for attachment to handle-bar. It consists of a small hook which can be slipped over any handle-bar, and will be obtainable in two types, one for inverted and the other for ordinary levers. Its cost is a few pence only, and it is an advantage under certain conditions to be able to leave

Reflex-Clipper "Ideal" special non-slipping tread.

the lever raised and to attend to some other portion of the machine, such as removing and replacing the belt. The Bowden auxiliary air inlet is an item which has been of assistance to riders during the late summer; it can be fitted to practically any machine.

R. Broadhurst.

Among the accessories which will be found on Stand 216 may be mentioned the Broadhurst mirror lens searchlight with and without hood in two sizes, 4in. and 4½in. An entirely new model head lamp with Mangin mirror lens will also be exhibited for the first time. This lamp will be supported on a fork bracket. Another novelty will be an electric dynamo fitted to a motor cycle and driven by the engine to supply current for lighting the lamp. Mr. Broadhurst will also show a complete range of touring kits, tool kits, mirrors, watches, and other specialities.

XL'All Saddles and Seats.

XL'All saddles will be found on Stand No. 117. Riders who study comfort should not fail to make a careful examination of this exhibit. There are practically no alterations for 1912, except that various styles of seat pillars have been introduced to suit different makes of machines by means of which the lowest possible riding position may be obtained. The anatomical bucket seat can now be obtained with a framework and pillar giving a much lower position than formerly. There is no doubt about the comfort of these seats, which have been used in more than one long distance record performance. We can also testify to their excellence from personal experience.

Terry's neat cable casing.

A. H. Hunt.

Many enterprising novelties, some of which will be shown for the first time, will be found on Mr. A. H. Hunt's stand. One of the most interesting will be a switch suitable for use with magneto or battery. The back of the switch frame is made of solid brass and is stepped; when the lever is pressed down and pushed over, contact is made with a plate at the farther end. This cuts out the magneto, or, if battery ignition be fitted, completes the circuit. Mr. Hunt has introduced a sparking plug protector made of a peculiar insulating material. The protector is both fireproof and waterproof. Recessed in the top is a brass washer, providing a good connection for the sparking plug. To prove that it is uninjured by fire we saw one of the protectors placed inside a gas stove and removed red hot yet quite undamaged.

Yet another novelty is a plug connection, which may be placed in no less than four positions, so that should the high tension wire be touching the cylinder, it may be, by the aid of this connection, held clear of it. The connection consists of a tube in which there are several holes, so that the plug at the end of the terminal may be slipped in any one of these.

Toronto M.C.C. Endurance Run.

The first endurance run held in Ontario took place on October 28th, 29th, and 30th, starting from Toronto. The route taken was via Lake Shore to Hamilton, Brantford, Woodstock, and London. Return via Stratford, Berlin, Guelph, and Waterdown. Over thirty competitors took part and rode Bradbury, Excelsior, Flying Merkel, Harley Davidson, Indian, Minneapolis, M.M., Pierce Arrow, Rudge, and Thor motor cycles. The affair was most successful. The roads were in fine condition with the exception of Lake Shore, which had a few mud pits and sand hills. The winners of perfect scores will have their names engraved on the Dunlop Trophy and receive a prize of ten dollars.

Any three could form a team provided they were named before the start. The scoring results were as follows:

1. Four perfect scores.—Sam Vogan, two-speed 5 h.p.; Steve License, Harley Davidson; O. D. Cooley, 5 h.p. Indian; F. Craig, 4 h.p. Flying Merkel.

2. Four tied.—E. McIntosh (4 h.p. Excelsior), one minute early at secret control; N. J. Davis (5 h.p. Indian), one minute early at secret control; Frank Lemon (5 h.p. Indian), one minute early at secret control.

Team Results.—1 (twin Indian) Connor, Daniels, and Lemon. 2 (4 h.p. Indian) Webb, Neilson, and Case. 3 (4 h.p. Excelsior), Golden, McIntosh, and Thompson.

CLUB NEWS.

Sheffield and Hallamshire M.C.C.

The annual dinner and prize giving was held on the 9th inst., followed by a dance.

Western District M.C.

A meeting has been arranged at the Olympia Motor Cycle Show for Thursday, November 23rd, at 8 p.m. Addison Road entrance.

Walthamstow M.C.

A non-stop speed-judging competition was held on the 5th inst. over a thirty mile course that had to be covered twice. The roads were very greasy in places, and, with the strong wind and plenty of hills, a very sporting contest resulted as follows. Winning team:

Rider and machine.	Time error.
W. Applebee (3½ Rudge)	1m. 19½s. fast
M. Raven (3½ Rudge)	3m. 19s. fast
Newing (4 Bradbury tricar)	18m. 20s. slow
The best individual performance was:	
W. S. Low (3¾ Scott and sidecar)	17½s. fast

Birmingham M.C.C.

The second round of the above club's autumn reliability trials was run off on Saturday last, the course was from Birmingham to Kidderminster, Bewdley, Bridgnorth, and back to Birmingham.

The following are the survivors: V. Basby, 3½ Humber; H. J. Dixon, 3½ New Hudson; R. W. Duke, 3½ Zenith; R. H. Edwards, 3½ Triumph. There will be no trial for the next two Saturdays on account of the Show. The third round will be held on December 2nd over a course to be announced later.

West Essex A.C.

A hill-climbing competition was held in the neighbourhood of Upminster recently by the above club. The following shows the results of the first eight riders in the motor cycle class:

Rider and machine.	Time.	f.o.m.
W. H. Elce (3½ T.T. Rudge)	29½s. ...	767
W. E. Gunnett (3½ T.T. Triumph)	35s. ...	591
R. Whitmore (3½ Rudge)	36½s. ...	585
J. L. Love (3½ T.T. Triumph)	38½s. ...	515
W. M. Gunnett (3½ T.T. Rudge)	37½s. ...	513
T. N. Tyson (3½ Rex)	40½s. ...	449
R. Adams (3½ Triumph)	41½s. ...	403
C. Lovett (3½ T.T. Bat)	44½s. ...	382

Newcastle and District M.C.

The members of this club held a most interesting and instructive competition at the club premises, Saville Row, Newcastle, last Thursday evening, the competitors being required to rectify in four minutes a fault previously created in a Triumph motor cycle. The sparking plug was faked and the wire detached from the throttle, and out of the eighteen competitors only Mr. R. Wilson was able to get the machine to fire, and then only whilst pedalling. Since no one succeeded in satisfactorily accomplishing the task set, namely, to get the machine going on the stand, the second prize was awarded to Mr. Wilson, and the first prize was held over to be added to the first prize in the next competition.

Westmorland M.C.C.

The Westmorland M.C.C. held its annual dinner and prize distribution on Thursday, November 9th, after which Mr. G. M. Somervell gave away the prizes.

Southampton and District M.C.

The annual dinner of this club will be held at Scullard's Hotel, Above Bar, Southampton, on Wednesday, November 29th, at 8 p.m., after which the prizes won during the past season will be presented.

Bristol B. and M.C.

The annual meeting was held on the 8th inst., when the election of officers took place and some changes in the rules were proposed, the motor cycle section having become the most important part of the club. The dinner was a great success. A gold watch was presented to Mr. F. W. Gent Wood, hon. secretary for the last five years, and prizes and medals to the successful competitors of the past season.

Bishop Auckland, Darlington, and District M.C.

The annual general meeting will be held at the King's Head Hotel, Darlington, on Wednesday, December 13th, at 6 p.m., when the election of officers and committee for next season will take place.

1912 Triumph, showing new adjustable footrests, foot operated magneto control, new tank support, and drilled engine pulley.

Club News.—**Ilkley and District M.C.C.**

The first annual dinner and presentation of prizes of the above club will be held at the Crescent Hotel, Ilkley, this evening at 7.30.

Cowbridge and District M.C.

A motor club has been formed called "The Cowbridge and District Motor Club." Motor cyclists desiring information regarding membership are requested to communicate with the hon secretary, Mr. B. S. Bird, Cowbridge.

Western District M.C.

The club will hold its annual twelve hours' winter reliability run on Saturday, December 30th. Owing to the A.C.U. up to now refusing to pass permit for this open reliability trial, the run will be confined to members of the club. Full particulars of the run and membership of the club can be obtained from Mr. G. Rowden, 40, Frognal, Hampstead, N.W.

H. Graham Dixon who is supposed to be the first to climb Sunrising Hill in competition, on a 3½ h.p. motor cycle and sidecar. His mount is a three-speed New Hudson.

The Motor Cycling Club

At the annual dinner, to be held at the Café Monaco on December 9th, all the trophies, prizes, and medals won during the year will be presented by Mrs. Charles Jarrott. These number 173, and include, among others, the president's cup, won by A. J. Moorhouse in the London-Land's End-London; the prize presented by Mrs. Jarrott for the best performance in the August reliability run, won by W. Pratt; The Motor Cycle Inter Team Challenge Cup, won this year by the Derby and District M.C.C. (previous winners the Coventry and Warwickshire M.C.C. and the Motor Cycling Club); a gold cup presented by Mr. Harry Smith (vice-president) for the Motor Cycling Club Championship, won by A. J. Moorhouse; the Motor Cycling Club Challenge Cup presented by Messrs. S. H. Fry, E. Gwynne, and C. J. Seed for the best performance in the London-Edinburgh, won by G. Brongh.

Ayr and District M.C.

The fourth annual dinner and presentation of prizes has been arranged to take place at the Ayr Arms Hotel on Wednesday, November 29th. A cordial invitation is extended to all interested, and tickets may be obtained from the joint hon. secretaries at the club's headquarters, 73, Dalblair Road.

Blackpool and Fylde M.C.C.

The club referred to on November 2nd has now been formed under the above title. The following officials have been appointed: President, Mr. T. Sharples; vice-presidents, Messrs. T. Ball and F. Taylor; captain, Mr. T. Ball; vice-captain, Mr. W. T. Chadwick.

York County M.C.C.

The third annual dinner and prize distribution of the above club will take place at headquarters, the Grand Central Hotel, Briggate, Leeds, on Friday, November 17th, at 7.15 p.m. prompt. Tickets, 3s. 6d. each, may be obtained from the hon sec., Mr. W. E. Asquith, 11, Moorland Street, Hyde Park Road, Leeds.

Durham and District M.C.C.

The opening of the winter programme was begun with a smoking concert on the 4th inst. A fault finding competition will be held at headquarters, Nevilles Cross Hotel, Durham, on Saturday, 18th inst., at 7 p.m., for a 26 x 2½ tube presented by Mr. W. Burnett.

West Essex A.C.

This club finished its programme for the season with a hill-climb at Upminster on Saturday, and, subject to confirmation by the committee, the result is as follows: 1, W. H. Elce (T.T. Rudge), time 29½s.; 2, W. E. Gunnett (T.T. Triumph), 35½s.; 3, R. H. Whitmore (Rudge), 36½s.

Taunton and District M.C.C.

A most fitting culmination of the club's first session was the very enjoyable dinner held on the 30th ult., at Clarke's Hotel, Taunton, when Col. D. F. Boles, M.P. for West Somerset, took the chair. There was a very large number of members and friends present, and a capital musical programme was interspersed with many speeches of a most interesting character.

Tunbridge Wells and District M.C.C.

The winter programme (November-February) has been arranged as follows: Wednesday, November 22nd, club outing to Olympia Motor Cycle Show; Wednesday, December 6th, breakdown competition; Wednesday, January 3rd, winter reliability trials; Wednesday, January 24th, smoking concert, to be attended by the president (His Worship the Mayor of Tunbridge Wells, Col. Sydney Sladen); Saturday, February 3rd, lantern lecture, "Power and Speed." Tickets for the forthcoming Olympia Motor Cycle Show (November 20th to 25th) may be obtained at half-price (6d.) from the hon. sec.

Oldham and District M.C.

The weekly meeting of the above club on the 1st inst. took the form of a debate on the relative merits of chain and belt drives as applied to motor cycles. Mr. Bleasdale was ably supported in his contentions for the rubber belt, as also was Mr. Platt, who championed the chain drive.

About twenty members took part in the discussion, and altogether a somewhat instructive evening was spent. A programme has been arranged providing for similar weekly discussions and demonstrations on motor cycle matters, interspersed with social events. Five new members were elected, thus bringing the roll up to sixty-four. A billiard match Married v. Single, to be followed by a supper, is the fixture for next Tuesday, the 14th inst.

NEXT WEEK!**Olympia Show Report.**

Thursday, Nov. 23rd.

One Penny.

THE MOTOR CYCLE BUYERS' GUIDE OF 1912 MODELS

COMPLETE SPECIFICATIONS of all MOTOR CYCLES on the BRITISH MARKET.

This Guide appears at a most opportune time, when actual and prospective motor cyclists are considering the question of a new mount and what make they shall order at the Olympia Show, which opens on Monday next. Armed with a copy of this issue a reader may consider at his leisure the specifications of the numerous machines he has in view, and again at Olympia be in possession of full details which would occasion much questioning of busy stand attendants. A straight edge or rule laid across the page renders the line much more easy to follow. Owing to the fact that one or two new models were not completed at the time this issue went to press, occasional omissions in dimensions and other particulars will be found. Whilst every effort has been made to avoid inaccuracies we cannot be held responsible for any errors that may have occurred. To save space the following abbreviations have been used:

INLET VALVES.—A. = Automatic. M. = Mechanical. S.S. = Valves Side by Side.

VARIABLE GEARS.—C. = Counter-shaft. E. = Engine-shaft. H. = Hub. V.P. = Variable Pulley. F.E. = Free Engine.

TYRES.—A. = Avon. C. = Clincher. Con. = Continental. D. = Dunlop. G. = Goodrich. H. = Hutchinson. K. = Kempshall.

L. = Liberty. M. = Michelin. Mid. = Midland. Mo. = Moseley. P. = Palmer. P.C. = Palmer Cord.

Ardwick, MANCHESTER.

DOWN TO THE LAST DROP

“RUSOLINE”

MOTOR OIL LUBRICATES.

We are gratified at the numerous requests we have had for our little booklet, entitled “Motor Lubrication,” which we will mail as soon as we get a fresh supply. Meantime,

TEST “RUSOLINE.”

Manufactured under the supervision of

W. RUSSELL

(Late of Price's Patent Candle Co. Ltd.),

London,

BY

RUSSELL BROS., National Oil Wks., BIRMINGHAM.

PERFECTION

(TRUMP MOTOR CYCLES)

3 1/2 h.p. J.A.P. Engine.

Bosch 1912 Magneto. Finest finish.

EVERY DETAIL OF THE HIGHEST GRADE.

THE LIGHTEST: 170 lbs.

THE STRONGEST: I rode an identical model frame at Brooklands, on July 25, 1911, securing **WORLD'S RECORD** for 110 miles 297 yds. in 2 hours, and I weigh over 15 stones.

I SHALL BE AT OLYMPIA, STAND No. 135.

Will you give me a call?

We are showing 3 models: **ROADSTER, T.T., and FREE ENGINE TWIN CYLINDER** with 2-speed gear.

F. A. McNAB, Sales Director.

TRUMP MOTORS, LTD.,

36, John Bright Street, BIRMINGHAM.

WE CAN GIVE IMMEDIATE DELIVERY.

THE RANGE OF

PALMER

MOTOR CYCLE TYRES

FOR 1912.

EVERY RIDER CATERED FOR.

THE PALMER CORD.

3 Ribbed and Rubber Studded Treads. The strongest and safest tyre ever made.

THE NEW PALMER HEAVY FABRIC.

3 Ribbed and Rubber Studded Treads. Second only to the Palmer Cord.

THE PALMER ORDINARY FABRIC.

3 Ribbed and Rubber Studded Treads. Specially recommended for light machines.

THE NEW "PRIVATEER"

Ribbed and Rubber Studded Treads. A good tyre at a low price with excellent tread and wearing qualities.

Write to-day for Descriptive Booklet.

OLYMPIA SHOW**STAND NO. 166 GROUND FLOOR**

Opposite Triumph Cycle Co.'s Stand.

SHAMROCK**CLORIA****EXCELSIOR**THE
LEADING
MOTOR CYCLE
BELTTHE MOST
EFFECTIVE
RUBBER
NON-SKID**OUTCLASS ALL OTHERS**

THE HANOVER RUBBER CO., 29, OLD ST. LONDON E.C.

A FULL range of 1912 patterns will be shown at Olympia. Don't miss our exhibits, which are certain to interest you.

REMEMBER the high standard and the premier position held by "Shamrock Specialities" for years.

"S.-E." Tyres used in the End-to-End Sidecar Record are the only tyres that required *no* attention. "S.-G." Belts are responsible for the Record Speed of 91.37 miles per hour.

"S.-G.," "S.-E.," THE ORIGINAL & THE BEST.

B. & H.

LODGE**SPARKING PLUGS,**

Designed for Maximum Power,
are by far the most successful plugs ever made
for Magneto ignition.

Pure nickel non-corrosible sparking points
guaranteed.

The Lodge Plug has the biggest sale of any
British made plugs.

On Sale at the **OLYMPIA SHOW** by all
the best accessory dealers in the gallery;
and fitted on many of the best motor cycles
in the hall.

Two Models are made:

The well-known "motor cycle" type, price 4/.,
and the new 1912 model, price 5/., the patent
solid construction of which is here illustrated.

Lodge Plugs are obtainable everywhere, or they may be
had post free, by return when remittance accompanies
order, direct from the makers:

Lodge Bros. & Co., Dept. E, Birmingham.
14, New St.,

"My mount for 1912" N.S.U.

"Yours?"

The selection of an N.S.U. can always be made with full confidence of securing complete and lasting satisfaction. It could not be otherwise with this famous machine, for in quality of material and finish, in general appearance and comfort, in soundness of construction and reliability, the N.S.U. has absolutely no superior. It has always been our policy, too, to keep the N.S.U. in the forefront of motor cycle design, and to give N.S.U. owners the best possible value for money. Compare the N.S.U., point for point, with any other machine you like. The comparison will result in favour of the N.S.U. Here are our 1912 models:

2½ h.p. Single-cyl.	..	66 x 78	All fitted with LOOP FRAME, special spring forks, rear spring, auto- matic carburettor, etc., etc.
3 h.p. Twin-cyl.	..	58 x 75	
3½ h.p. Single-cyl.	..	85 x 88	
6 h.p. Twin-cyl.	..	75 x 90	

Make a special point of inspecting them at

Olympia. Stand 104.

N.S.U.
3 h.p.
twin-cyl.

BEFORE leaving the subject of epicyclic gears, two more gears of this description should be mentioned, viz., the Albion two-speed hub, a very convenient gear for fitting to existing machines without alteration, and which is combined with a multiple plate clutch (this gear belongs to the third type of epicyclic gears), and the Hingston and Brown gear, illustrated and described in our issue for October 26th, which embodies a somewhat new arrangement of the epicyclic principle, inasmuch as only two gear wheels are employed—an internally toothed wheel set eccentrically and a sun wheel around which it rolls when the latter is held firmly for the purpose of bringing the low gear into play. The internally toothed wheel is made to revolve by being mounted on a ball bearing, eccentric with regard to the hub, and it is connected to the hub shell, which it carries round by four toggle arms. On the high gear the whole is locked solid by an expanding clutch.

In epicyclic gearing it is usual to operate the changes by means of friction bands and clutches; this very much simplifies gear changing and makes it almost impossible to damage the gear by injudicious changing.

2. Sliding Tooth.

The sliding tooth gear follows car practice, but it is made for two or three speeds instead of four and has no reverse, consequently it is light and simple. The T.A.C. three-speed is an excellent example of this gear. Chater-Lea, Ltd., also make it, both two and three speed. Gears on this principle are not suited to the engine-shaft or hub, but are always found on the counter-shaft. A separate friction clutch is required to allow the changes to be made smoothly and without damaging the teeth. Any ratios can be arranged. The top, or any other gear, can be made direct, but in the T.A.C. this is not done, as the driving and driven shafts are not in the same straight

line; however, as only one pair of wheels are in engagement at a time, there is but little friction. This principle is also found on the F.N. lightweight.

3. Teeth in Mesh—Sliding Dog Clutch.

This system has an advantage over the last in that the teeth being always in mesh there is less chance of damaging the gears while changing, and the disadvantage that the gears are running when not required. It is suitable for a two-speed gear on the counter-shaft, and is the principle employed on the Indian, Douglas, Fafnir, Morgan Runabout, Blumfield, James, Singer, and others. It is, in fact, a type that is coming very much to the front on account of its undoubted simplicity and reliability. A combination chain and belt drive is commonly used with this gear, though some firms use chains throughout, and on the Singer gear and belt drive is used. On the A.J.S. the gear is combined with a friction clutch having cork insets, which permits a very gradual engagement. The Corah two-speed gear is of a similar character, but it is operated by expanding bronze clutches instead of a sliding dog clutch.

4. Selective Clutch.

The selective clutch principle has the great advantage that both gears are direct, but it must be remembered that the gear not in use is running idly with a certain amount of added friction (though not much) as compared with a single drive. The old Raleigh gear employed one chain from engine to counter-shaft and two to the back wheel, the hub of which contained a sliding dog clutch, but better and pleasanter results can be obtained by using friction clutches giving a gradual engagement as is done in the P. and M., Scott, Royal Enfield, and Clyno.

This gear is most commonly used on chain-driven machines, and is fitted in the counter-shaft, but it can be used with a combination of chain and belt, as is

EXAMPLES OF DIFFERENT TYPES OF CHANGE SPEED GEARS.

" FITTED WITH THE FAMOUS "

what Record is it not possible to achieve?

—To the motor cyclist who has studied the record performances achieved throughout the past two years, probably no more remarkable outstanding feature presents itself than the fact that the majority of the winning machines have all been fitted with Lycett's "LYSO" Rubber Belt.

—So often, in fact, has this been the case that the phrase "fitted with the famous LYSO Belt" has become a household word—and it is a matter for interesting speculation as to really *what* a machine so equipped may attain?

We have pleasure in presenting here the latest "Record"—this time the "LIGHTWEIGHT" Motor Cycle Championship:—Mr. N. D. Slatter, on Oct. 31st, at Brooklands, riding an Alcyon Lightweight, beat the Six Hours' Class A Record, covering 223 miles 1494 yards! Other records he captured were the 2 hours; 3 hours; 4 hours; 5 hours; and 200 miles!

—Think it over—and make a point of seeing us at **Stand 228, OLYMPIA SHOW**, if visiting.

LYCETT'S, "The Saddlery," BIRMINGHAM.

THE FAMOUS BEDELIA

TORPEDO TWO-SEATER.

Weight, 2½ to 3 cwt.

Speed, Comfort, & Reliability.

"The B.D. engines fitted to Bedelia Cars are specially constructed, and are not ordinary motor-cycle engines. They are constructed from data acquired by experience gained with aviation motors. The angle at which the cylinders of the two-cylinder 10 horse-power model are set, viz., 90°, gives as mathematically correct a balance as a four-cylinder motor, and the almost complete absence of vibration is remarkable. The working parts are as extremely light as is consistent with durability; and a high efficiency in air-cooling has also been obtained.

"The well-known Quentin engines fitted to the cheaper models are highly efficient for their small size, and are extraordinarily economical in petrol consumption."

56 guineas, 66 guineas, 86 guineas, 96 guineas.

Variable Gears and Motor Cycles.—

done on the two-speed Bat, where the P. and M. gear is employed. It is usual to employ two chains from the crank axle, which is sometimes fitted with a friction clutch to the counter-shaft, and one chain or belt from the counter-shaft to the back wheel. The counter-shaft is usually behind the engine, the Bat and Fafnir being exceptions; the former plan being suitable to chain drive and the latter to belt drive, for in the case of a belt it is not advisable to have the pulley too near the back wheel.

The P. and M. gear is changed by a handle on the right-hand side of machine, to which is attached a light chain like a bicycle chain; this in turn works a coarse-threaded screw which moves metal wedges and expands the required phosphor bronze ring.

The Enfield gear, which is very similar, is worked by means of a handle just in front of the saddle. This expands internal rings which grip the required chain wheel. The standard gears are $5\frac{3}{4}$ and $7\frac{3}{4}$ to 1.

The Scott gear is worked by the foot by means of a rocking pedal and expanding rings.

The 1912 Clyno differs from last year's model in having double clutches worked by expanding phosphor-bronze rings.

EXAMPLES OF DIFFERENT TYPES OF CHANGE SPEED GEARS.

No. 4. The Douglas dog clutch two-speed gear.

The Jonsca gear, lately described in our columns, is an application of the selective clutch type to a double belt drive, the expanding clutches being in the back hub and worked by a pedal. It has also geared-down engine pulleys which give a simple means of tightening the belts.

While on the subject of transmission by chain or gear from the engine I should like to point out that it is desirable in all such cases that there should be some kind of friction clutch on the engine-shaft, for in addition to rendering the drive smooth and removing harshness, such a device has the advantage of preventing the shock of the explosion from falling on the same teeth of the sprocket or gear wheel at every explosion of the engine, which would be the case if the sprocket were rigidly fixed to the engine-shaft.

5. Expanding Pulleys.

Expanding pulleys must not be confounded with the adjustable pulleys found on most machines, even

those with two-speed gears, for the latter cannot be altered while the machine is in motion, and therefore do not come within my definition of a variable gear.

The best known example of the variable pulley is the Zenith Gradua, though I believe the Osborne four-speed pulley was the first of its type. The Zenith Gradua gets over the difficulty of belt tension by an arrangement which forces the rear wheel back as the gear is lowered, thus taking up automatically the slack of the belt. The Osborne is still a four-speed gear, and allows for taking up the slack by moving the back wheel, which is done by the feet; it is then locked in the required position. The Lloyd automatic pulley should also be mentioned here. This pulley has a loose flange, which is forced against the belt by a series of springs, and as the tension of the belt due to load increases, the belt forces the flange back, and so lowers the gear automatically to suit the road conditions; the reverse takes place when the load becomes lighter. The pulley can also be expanded and the gear lowered by a rolling wedge attached to a lever; this is useful for starting purposes.

The new Rudge variable gear is another example of the expanding pulley type. Both pulley and rim are expanded and contracted. It is arranged to give no less than twenty variations of gear, and is worked by a lever at the left side of the tank.

The Midget Bicar gear is a three-speed pulley in which the movable flange is held in place by ratchet teeth. The pulley movement and belt tension are accomplished by a single lever. The Ariel is another machine on which this gear is employed. Obviously this type of variable gear is suited to a V belt only.

Belts and Variable Gears.

A belt is subjected to changes of tension, instantaneous or otherwise, when the force applied to the driving wheel is altered; the method of alteration makes no difference. This force is constantly changing on any kind of motor cycle, except when running at a steady pace on level ground or on an unvarying gradient. So long as the belt rim is fixed to the back wheel the tension of the belt must change for every variation of speed or slope, unless the slope is accountable for the change of speed, and a variable gear on the crankshaft or counter-shaft makes no difference at all to this tension, but simply allows the engine to run more nearly to its normal number of revolutions, and consequently more steadily. Of course, it is possible to jerk one's gear, and consequently one's belt, by suddenly changing up when the engine is running fast; the same thing can be done by raising the exhaust and dropping it again on full throttle. In the case of a hub gear the belt is relieved of a large amount of strain in hill-climbing, as it is kept running fast even when the machine has slowed down. A variable gear, then, assists the belt in the following ways. If on the hub, it allows the belt speed to be maintained, and consequently the tension is less (see any book on mechanics under "Levers"). If on the counter-shaft, it admits of the belt pulley being much larger, and the belt is therefore subjected to less bending strain and has a larger bearing surface, and consequently a better grip, and should wear much longer in consequence.

AURIGA.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Brakes on Two-speeders.

? I am getting a two-speed hub fitted to my $3\frac{1}{2}$ h.p. machine. I have difficulty about the brakes. With a sidecar efficient braking power will be more of a necessity. My experience of depending on a front brake has been unsatisfactory, and a brake acting on the inside of the belt rim when the engine is free is useless. (1.) What is usually done under such circumstances? (2.) Where can an extra brake be fitted? (3.) Is a brake on the inside of the belt rim not liable to jam? (There is no band brake with my particular two-speed hub.)—A.M.

It would have helped us to answer your letter if you had given us the make of your machine and the type of gear with which it is being fitted. When the top speed is in, the low gear band can be used as a brake. When the low speed is in engagement use the compression of the engine as a brake. All you can do is to fit either a dummy belt rim or a band brake, whichever can be most conveniently attached. This is a matter you will have to go into with your local repairer. There is no reason why a brake on the inside of the belt rim should jam if properly fitted.

Variable Gears.

? In *The Motor Cycle*, in the columns concerning variable gears, you say, concerning engine-shaft epicyclic gears, that the gear ratios can be varied. Do you mean that the two fixed ratios can be varied, and set higher or lower, and, if so, does this apply to the Fit-all? I ask because of the following: My machine—a 3 h.p. of 1910—has Fit-all gear, and the top ratio is 4 to 1, which with my weight, between 13 and 14 stones, means that I have to chance down to the low—about 9 to 1—for anything worth calling a hill. I have asked the makers of the machine, but they say nothing can be done to lower the gear ratio. Can you suggest anything? $4\frac{1}{2}$ to 1 would be better, but I can hardly expect it to climb far on 4 to 1 with a rider nearly 14 st. and full touring kit, the engine being only 3 h.p.—S.F.C.

We presume you refer to the words, "On the other hand, any desired variation can be made." This means that in designing a gear the reduction for low gear can be 20%, 40%, or any other

ratio that may be desired. When the gear is once made the ratio is fixed, and can only be altered by fitting gear wheels of a different size, and it is possible that the company do not make any but the standard size. The top gear is got by running the whole gear solid. An adjustable pulley or a larger rear belt rim are the only means of altering this, and if you lower the high gear in this way you also lower the bottom ratio, which may not be desirable. The low gear is too low for solo work, but would be more suitable for use with a sidecar.

Long or Short Stroke.

? I should be obliged if you would give me information on the following points: (1.) What are the advantages and disadvantages respectively of an engine having a stroke appreciably longer than the bore, and one having both practically equal? (2.) I am thinking of getting a $2\frac{3}{4}$ h.p. machine. (a.) Would you advise a make fitted with chain or belt transmission? (b.) About how long will a chain last; also is it necessary when fitting a new chain to fit new sprockets as well, or do these latter outlast the chain?—R.H.P.

Long Hills and Two-speed Gears.

? I have a $2\frac{3}{4}$ h.p. 1910 Minerva motor cycle, with one brake on the rear axle (band brake), and should like to have the second brake on the front wheel. Because the front fork is a springing one, it is necessary to have a brake with Bowden wire. I should like to know if such a brake on the front wheel can become dangerous for the rider, or for the cycle construction. My second question concerns the variable gear. I bought this summer, with your approval, a Millennium two-speed gear. This gear I put in the rear axle, and now I find that with the variable gear I cannot ride a long steep hill, for the motor stops after ten or twelve yards, and still the belt is as tight as necessary. How can I change that?—W.C. (Rotterdam).

We do not think that the front brake will be in any way dangerous, and if you state your requirements to Messrs. Bowden Wire, Ltd., we think they will be able to supply you with what you require. It is quite extraordinary that you cannot manage a long hill with the two-speed gear. Of course, a gear adds weight, and this will account for your not going quite so fast or so far on the top speed as you could before the gear was fitted, but if you find you cannot climb a long and steep hill on the low gear, we think the trouble is probably in the engine and not in the gear, as it may be caused through overloading. If the engine is at all prone to overheat it is exceedingly difficult to cure, and we can only recommend that you see that the piston and piston head are clear of carbon deposit, that your valve springs have sufficient tension, that the exhaust valve lift is ample, and that the carburetter is not giving off too strong a mixture.

The new Veloc engine. A novel point in connection with this engine is that a two-speed gear, free engine, and automatic pump lubricator are all combined in the crank case. (See last week's issue pages 1175-1176.)

Trembler to Plain Coil.

I shall be obliged if you can inform me if it is possible to change a 2½ h.p. Excelsior engine from trembler to a plain coil without altering the contact breaker, which is a wipe contact.—W.N.

o, the type of contact breaker must be altered, a make and break contact breaker having to be fitted. See letter 6027 in our issue of November 9th.

Cambridge to Wellington College.

I sometimes see in your paper routes which you advise between different places. Could you oblige me with the best route between Cambridge and Wellington College?—S.W.T.

We have pleasure in giving the following route: Cambridge, Royston, Balock, Hitchin, Luton, Dunstable, Tring, Hemel Hempstead, Amersham, High Wycombe, Great Marlow, Twyford, Wokingham, and Wellington.

Concerning a Sidecar.

I am hoping shortly to get a motor cycle and sidecar, and have been advised to get a 3½ h.p. two-speed Humber, free engine.

(1.) Do you consider this power sufficient for sidecar work (self and passenger about 17 stones)? (2.) What is the most suitable make of sidecar? (3.) Would you advise pedals or footboards?—H.W.

(4.) The machine you refer to should be quite satisfactory if you do not use it in too hilly a district. (2.) Any well-known make of sidecar would suit your purpose. (3.) Pedals would not be necessary if a two-speed gear were fitted.

Alterations required for Sidecar Work.

My machine is a 3½ h.p. 1911 single speed, which has gone splendidly all the season. I shall be fitting a two-speed gear and sidecar at Christmas. (1.) Is the N.S.U. a reliable gear, and with engine in tune shall we be able to get up hills of 1 in 10 (combined weight of self and passenger 18 stones)? (2.) Is the timing different on solo and sidecar machines? If so, is it essential to alter it? (3.) Would it be advisable to fit a larger jet (B. and B.)? (4.) Are there any extra licences for sidecar? The machine at Christmas will have run about 3,500, and is at present going splendidly. It has always been driven carefully. (5.) Will it be then necessary to have the engine overhauled by the makers or not? and also what parts should then be renewed in the magneto? Finally (6.), is there any cure for the throttle slide jamming when the engine is very hot?—G.B.S.

(1.) The N.S.U. gear is very reliable. You would probably be able to climb hills of 1 in 10 with it if the road surface be good. (2.) No, we do not think you need alter the timing, but it might be advisable to lower the gear slightly. (3.) Perhaps a larger jet would be advisable, but do not increase jet unless you find it necessary, and then not much. (4.) No. (5.) There is no necessity to have the engine overhauled unless it shows signs of falling off in power. (6.) You could ease the throttle slides by rubbing them down with emery paper and attending to spring.

Mysterious Knocking.

I have a 1910 3½ h.p., which until lately has been going very well. Now it will not take open throttle on hills without slight knocking, even at speed. The magneto and carburettor adjustments are the same as when machine was delivered. I am satisfied that the trouble is not caused by carbon. A little time ago this knocking set in after only 200 miles since cleaning. I thought I had been giving too much oil, but on taking the cylinder off, I was surprised to find only a slight deposit, certainly not enough to cause bad knocking. Since then the machine has only done about seventy miles, and the trouble has come on again almost directly. The engine keeps perfectly cool. I give a pumpful of oil every twelve miles. The compression is excellent, and there is ample clearance between valve stems and tappets. Would a worn bearing somewhere cause it? When my engine runs lightly there is a clinking sound. I do not think it is the gudgeon or big-end bush, as I can find no vertical play there. The pulley bearing is quite all right. Would a dirty silencer cause it, or an obstruction in the exhaust pipe, even though I run with cut-out open?—J.T.

Perhaps you are using a sparking plug the points of which project too far into the cylinder and cause pre-ignition. Of course, a worn bearing would cause the trouble. If you had the engine down you could easily tell if this were the case. A dirty silencer would hardly cause the knocking, but would reduce the power.

EXPERIENCES WANTED.

"R.V." (Edinburgh). 3½ h.p. Lincoln-Elk solo and with sidecar.

"Z.Y.Z." (Scotland). 1911 3½ h.p. Scott, regarding general reliability, hill-climbing powers, and ease of starting.

"G.F.D." (Hagley). Morgan runabout and No. 7 Chater-Lea, with regard to hill-climbing and wear of tyres.

"H.W.H." (Crowborough). 3½ h.p. Ivy Precision for touring.

"M.M.R." (Dublin). 5 h.p. twin A.S.L. 1909 or 1910 pattern, also four-cylinder F.N., particularly with regard to sidecar capabilities of both machines.

"W.F.H." (Weybridge). 3½ h.p. 1911 Bradbury, also 3½ h.p. two-speed Humber with sidecar.

"I.K." 479. 1911 Scott and sidecar. General riding experiences wanted. Also 5 and 7 h.p. Indian.

Mr. M. J. SCHULTE, Managing Director of the Triumph Cycle Co., Ltd., who, although possessing cars, is a keen motor cyclist, and, fair weather or foul, rides his machine backwards and forwards from the Triumph works at Coventry to his home at Kenilworth.

It would be well for motor cyclists if more of our motor cycle company managers were practical riders. Incidentally, Mr. Schulte speaks highly of the Wellington boots he is seen wearing, for winter riding.

A Charge Mixing Device.

This device is inserted in the induction pipe and consists of a fan A mounted on a spindle in projections B, carried by a ring C which is of spring material to facilitate its insertion into place.—J. J.

Rowe, No. 27,123, 1910.

A Lycett Saddle.

The front of the saddle is pivoted to the underframe A at a point B forward of its peak, tensioning devices consisting of screwed thrust rods C being arranged at the rear. From the cantle plate de-

pend rods D, which are adjustably connected to springs E loosely pivoted on the underframe at F.—E. Lycett, No. 8215, 1911.

Notice of Removal.

Maude's Motor Mart inform us that they have moved their works from Halifax to Camden Town.

Motor Cycle Insurance.

Mr. Ernest J. Bass will be in attendance at Olympia, and will be pleased to meet clients and others interested in insurance.

Acetylene Gas Tubing.

To obviate the usual difficulty with ordinary acetylene gas tubing, the Severn Rubber Co., 94-96, Newhall Street, Birmingham, are selling a tubing in various lengths with moulded, thickened ends. It is practically impossible for this tubing to split at the ends and its life should therefore be considerably lengthened.

An Appreciation.

Mr. J. M. Clement, who is the winner of the pair of motor cycle tyres presented by the Coventry Rubber Co., in connection with a competition recently referred to in these columns, says: "I have nothing but praise for the Modèle de Luxe Non-skids, and during the whole time that I had them they gave the most complete satisfaction in every way."

Catalogues Received.

The 1912 catalogue of Brown and Barlow motor cycle carburetters is to hand. This contains, in addition to illustrations and full description of all the new models, hints on the manipulation and fitting of B. and B. carburetters which should be invaluable to users. Some useful speed tables are appended as well as a complete illustrated price-list of the component parts of the carburettor.

**A Valve Removing Tool.**

This tool comprises a forked plate A, which is passed beneath the spring cap B and between the cylinder flanges C after the engine has been turned to compress

**Cylinder Decarbonisation.**

On the 2nd inst. we had an opportunity of witnessing a private demonstration of a process for removing carbon deposits on a 5 h.p. twin-cylinder motor cycle engine, and the results so far as we can see were highly satisfactory. Every motor cyclist knows the trouble that arises from this cause, and will be interested in learning a few particulars of the Cylclean carbon process which is the property of the Internal Combustion Engine Cleaning Co., Ltd., 3, London Wall Buildings, E.C.

Briefly stated, the method consists of the injection of oxygen into the cylinders by means of a special apparatus and the application of a light, the result being that as the oxygen combines with the carbon the latter is completely burnt away. The test was very exhaustively carried out, and a continual ejection of red hot carbon sparks showed the presence of a large quantity of deposit, which must have been detrimental to the smooth running of the engine. The cylinders were cleaned in an incredibly short time, and we were given to understand that this was effected without in any way injuring them.

The Internal Combustion Engine Cleaning Co., Ltd., is appointing licensees throughout the country, to whom motor cycles may be sent for decarbonisation, the charge being very moderate indeed.

the spring D. Further rotation of the engine allows the valve to fall, when the cotter E can be extracted and the valve removed without difficulty.—J. A. Prestwich, No. 2092, 1911.

Engine Lubrication.

The crank case contains oil up to a suitable level, and the casing A for the timing gear is extended to accommodate a gear wheel B, driven by the pinion C. Rotation of the wheel B causes it to take

up a quantity of oil, which is delivered to the duct D, whence it passes by the pipe E to a tray F, the overflow falling to the bottom of the crank case.—W. Hall and D. W. Illius, No. 2908, 1911.

A Veteran Machine.

We hear that Mr. H. B. Karslake's old Dreadnought will be on exhibition at Messrs. W. and A. Bates's stand at Olympia.

New Halifax Firm.

A firm is now trading as Messrs. Scotts, Powell Street, Halifax, of which the principals are Messrs. J. W. Scott and C. T. Rhodes of that town.

Metric Equivalent Tables.

We are in receipt of a booklet entitled "50 Useful Metric Equivalent Tables," published by the Central Translation Institute, 16, Eastcheap, E.C., price 6d.

Alldays and Onions Dividend.

At a board meeting on the 9th inst. the directors of Alldays and Onions, Ltd., decided to declare the usual annual dividend of five per cent., together with the usual bonus of five per cent. on the ordinary shares, totalling ten per cent. for the year ending 5th August, 1911.

A Good Tyre Test.

Mr. D. R. O'Donovan, who recently rode a long distance trial on a 3½ h.p. Singer motor cycle, and whose performance was duly chronicled in our columns, called last week at our offices and showed us a Michelin cover, No. 761401, which had been in use on his machine during the whole of the ride, and while the rear wheel was sealed to the frame. During that time he covered 4,559 miles. The tread was worn through in one or two places to the canvas, but the beads were perfect. Apart from the long distance ridden, this is an excellent testimony to the Michelin tyres, as some covers burst at the bead before the treads are really worn out.

We divide the balance, £40 - 7 - 0, into twelve equal monthly instalments of £3 - 7 - 3, the first of which is due one month after delivery. We pay carriage.

We have large contracts, and can quote early deliveries if you order now.

Make an appointment with our representative at the Show, or write for fuller details.

Wm. WHITELEY, LTD.,

**QUEEN'S ROAD,
LONDON, W.**

Sir,
I like
to be fair,

and I admit right away that there are other
tyres—good tyres—but never one the equal of the

JOHN BULL CROSS GROOVE

in "wear and tear resisting" qualities. Now I don't want you to accept
that statement without proof—here I have not room to describe in detail all
the points which make for that superiority, but if you will call at

STAND 151, OLYMPIA,

the manufacturers will do so. They'll prove the quality—they'll show you how the tyre is
made—they'll demonstrate its merits—they'll explain to you the enormous pressure which is
applied in the process of its making—in short, they'll interest you—and comparison will clinch
their arguments. Will you call? If not in London, write us.

Leicester Rubber Co., Granby Rubber Works, Leicester.

—Did you say you wanted a Plug?—

Then read this letter:—

14th November, 1911.

I beg to inform you that I have used your **Oleo Plugs** in my 14/20
Wolseley car for the past three years. During 20,000 miles I have driven
my car they have given absolute satisfaction.

I drive my car entirely myself, and have never come across as good
Plugs in all my six years' experience.

Yours faithfully,
CAPTAIN IAN FORBES.

We do not tell you **Oleos** are the best: we let
our customers be our interpreters.

Oleos are fitted officially on the Military Areoplanes
at Tripoli! Why no others? You will easily find
the reply!

Insist upon having an **OLEO** on your motor
cycle, and you will soon write us a letter like the
above.

Ask for it at **OLYMPIA SHOW.**

The "PEDLEY PRODUCTS."

Stand 23. OLYMPIA SHOW Nov. 20-25.

- Every Visitor to the OLYMPIA SHOW is invited to call at "The PEDLEY Stand"—No. 23—and see the latest Tyre and Rubber goods we are placing on the market for the year 1912.
- There we shall be pleased to demonstrate to you in many ways the advantages of "QUALITY"—and show how every "PEDLEY Product" typifies the highest standard of excellence in its line.
- In addition to the well-known "PEDLEY 3-rib TYRE" we are introducing a cheaper tyre of exceptionally good quality and wear, viz: "The 'S_TA_GE_RD' TYRE," and this will appeal keenly to all motor cyclists who require a really high grade, non-skid, practically unpuncturable, tyre at a moderate figure.
- Then we have "The PEDLEY Rubber Motor Cycle BELT," the finest power-transmitter yet designed—it's a new departure in Belts and embodies a principle which increases its power and value two-fold, amongst many other features of merit.
- The "PEDLEY Butt-ended Inner TUBE" is another fine line that only needs seeing—and the PEDLEY range of Rubber Sundries for motor cycles.
- Don't miss our Exhibit—aim for Stand 23—and make a point of getting there.

ADDRESS : 20, TUDOR STREET, LONDON, E.C.

Olympia.

THE second annual exhibition of motor cycles, cycles, and accessories is in full swing this week. The predominating feature of the Show is the great increase in the number of change-speed gears exhibited, whilst other less noticeable tendencies are the growing adoption of foot-starting devices, two-stroke engines, and spring frames. Dealing with the various types of gears, the positions in the hub and on the engine-shaft are fairly evenly represented, but there is no mistaking the popularity of the counter-shaft gear.

In regard to frame design, there is little of note to record. The rearward dropped top tube is gaining favour because it affords a lower position for the rider. One or two firms who are looking ahead have adopted open frames which can be used equally well by women or men; these enable even a lower position than the dropped top tube type.

The popular 500 c.c. single-cylinder engine easily leads the way; then come the lightweight twins and 250 c.c. singles and the larger multi-cylinders up to 1,000 c.c. in the order named. The medium weight, with a 300 c.c. engine and multi-speed gear, is increasingly popular, and a very large number of these machines are in evidence. The large twins are chiefly in demand for passenger work, though sometimes used for solo riding by speed enthusiasts. The new A.C.U. rule for the Senior T.T. Race may popularise the 500 c.c. twin, but the simplicity of the single of the same size should certainly keep it in front.

Belt transmission is still the most popular. Chain drive is gaining ground, the introduction of clutches, either separately fitted or embodied in the

change speed gear, having robbed the chain of all its harshness. Chain drive is more popular on multi-cylinder engines than on singles. One or two firms have specialised on chains in conjunction with a single-cylinder engine, but the belt rules the roast. Variable gears have brought along combinations of chain and belt and gear and belt, the former being more prevalent. For serious passenger work chain transmission prevails, practically all self-contained passenger vehicles being so fitted, as well as numerous motor bicycles designed for sidecars.

Machines intended for solo and occasional passenger work are in many instances not provided with sufficiently large tanks. This is accounted for by the fear to add weight in the case of singles, but large twins intended almost solely for sidecar hauling should have two-gallon reservoirs.

Lubricating methods show a tendency towards an increase in sight drip feeds, but they are nearly always supplemented or combined with the ordinary hand injector. One or two examples of forced feed lubrication to the bearings are on view, and are naturally being critically examined.

Ladies are being catered for more than ever. The rush for ladies' motor bicycles will assuredly come with the advent of the ideal gear and free engine.

The advance made in one year in sidecar body construction is quite noticeable. Many refinements are now embodied in these handy attachments which were unheard of last year.

Incidentally, we may mention as one more illustration of the growth of the pastime that the circulation of this journal now exceeds 60,000 copies weekly, and the weekly circulation of the Show numbers is considerably in excess of those figures.

SIX YEARS OF MOTOR CYCLING.

By Mrs. M. C. COOKE.

ONCE more November is here, and the arrival of "Show Week" has put us all on the *qui vive* as to the number and style of the new models for ladies. What an encouraging year this has been! Almost every week we have read of some converts to the pastime, and next year, if one interprets the forecasts correctly, their names will be legion. Now that the suitability of the motor bicycle for ladies has been proved, most of the leading manufacturers are bringing out special models—lightweights, medium-weights, and heavyweights. Some time back there was great controversy as to which type of machine was more suitable—lightweight or heavyweight. An old adage, somewhat modified, says:

"Convince a woman against her will,
She's of the same opinion still."

However true this may be, I fancy in the end lightweights will win the day, as without doubt they are the more easily managed.

Back in the summer I had a little lightweight Humber. It was a most excellent machine, but had no change speed gear nor free engine. To me this was a drawback, and yet that little machine taught me a lesson; for, strange to say, the very thing I deplored made the most converts to the cause. The very fact of being able to pedal off in the same way as on a push-bicycle gave would-be riders confidence. By the time the engine fired they were on the move, and the ease with which they were able to continue completed the conquest. Personally, I like both types of machine, and

for beginners would advocate lightweights, most emphatically. Six years ago, when I joined the ranks, it was a case of Hobson's choice—heavyweight or nothing. My first mount was fitted with a 2 h.p. Minerva engine, two-speed gear, free engine, chain drive—in fact, in many respects exactly like some of the newest designs of to-day. In those days, spring forks and non-skid tyres only figured in dreams; accumulators, alas! were a stern reality, as one found to one's cost when touring in the wilds.

Methods of Starting.

"Ease of starting" appeals most strongly to the feminine mind. The sight of a lady motor cyclist stopped in a town or village invariably draws a crowd of people. The uppermost thought in their minds is,

"How does she start it?" Any rider who has been in this position must appreciate a machine which can be got under way without much apparent effort.

A running mount is decidedly the simplest and easiest, provided the machine is fitted with a low gear and footboards; with a high gear and pedals it would be impossible for a lady to start in this way.

The Enfield (lady's model) is particularly well adapted for this method of mounting. With the low gear in, it starts at a walking pace; you have only to step

TESTING NEW MODELS ON THE ROAD.

C.D.C.

Six Years of Motor Cycling.—

The new down tube on the writer's 3 1/2 h.p. open frame Triumph—the only one in existence—strengthening the frame at the point at which it broke some time ago. Mrs. Cooke characterises this portion of the frame as a weak point of many 1912 models.

on the footboard and seat yourself at leisure, putting in the high gear when you choose. Altogether, this machine is one of the prettiest I have seen. It is most graceful in outline, simple in its arrangements and fittings, and most delightful to drive. It is so low that one can sit comfortably in the saddle with both feet, if necessary, on the ground. I have not yet had the opportunity of testing its hill-climbing powers, but hope to do so in the next few days; it is very fast on the level. Last, but by no means least, I should say it is a very clean machine.

A Trial of a Twin-cylinder.

I have had a new experience lately—that of riding a twin-cylinder, namely, the Douglas, and I think it splendid. It is very easy to start—in fact, one of the easiest. I like the sound of the twin. The quiet swish-swish of the engine is most soothing to the mind, as is the gentle gliding movement to the body. The “pull” is much more even than that of a single.

The capabilities of this machine have been so well demonstrated in several important competitions this year that it would be superfluous for me to sing its praises. Personally, I do not think such a large shield for the engine and gear is required. It rather spoils the appearance, and is not necessary; a small perforated plate hinged between the two down tubes from the head would answer the same purpose and look better to my mind.

An Old and Faithful Friend.

I must give one word of appreciation to my faithful old friend the Triumph, which has been responsible for considerably over 3,000 miles of my pleasure this year. Through town or country, up long winding hills with hairpin bends, over Hartside to Alston (the highest market town in England), down round worse bends to the eastern side of the Range, over the Newcastle streets with their tramlines in the middle and big potholes at the sides, and over the even worse Durham colliery roads the machine romped along, giving an occasional “onk” as its only murmur, and that

against bad-driving. To part with such a friend seems to me impossible.

A great change seems to have come over the sport during the past year. The events are much more social than formerly. This may be accounted for by the large number of ladies who generally attend on motor bicycles and in sidecars. I venture to prophesy that a good many of the sidecarists of to-day will be motor bicyclists in the near future. I think I may also safely say that most of the leading clubs will extend a hearty welcome to any lady motor cyclist. The majority of present-day motor cyclists are thorough sportsmen, and are quite willing that their fair neighbours should vie with them in any suitable competition. I had the pleasure of being in Harrogate during the Six Days' Trial in August. It was a sight to see the competitors at work in their time allowance of thirty minutes each morning. And then the relating and comparing of experiences afterwards! No wonder motor cyclists have such a lot to say to each other when they meet.

OCCASIONAL COMMENTS

By "IXION"

Easily Detachable Back Wheels.

One tendency that I personally value may have escaped notice in a show that bristles with *embarras des richesses*. I refer to the accessible back wheel. I have known what it was to unfasten a chain, a belt, two stand struts, two mudguard struts, two rear fork ends, two chain stay ends, a belt rim brake rod, and two brake band rods before I could get my rear wheel out; and after that I had to readjust the bearing cones of the hub, and get all the above-named parts re-assembled in accurate register. This job need not face a lucky rider very often, but it is almost inevitable five or six times in the course of a year's hard riding, *e.g.*, perhaps one twice swops covers with the front wheel, once the rim gets kinked by a big stone and has to be straightened, twice one "does in" an endless tube, under circumstances where only an endless spare is available. Believe me, very few experiences of the kind are needed to make one rise up and bless the designer of a rapidly detachable back wheel.

This year I have been rendered quite mild of tongue by a machine which shed its back wheel if I spannered a couple of nuts slack, and I have learnt to place a possibly disproportionate value on the feature. I notice that the tendency is all in favour of the notion. Makers are even learning to retain rapid detachment of the wheel when the transmission is by no means simple.

One could hardly have two more difficult wheels to simplify than those on the Zenith-Gradua (with its sliding chain stays) and the Clyno (with its two encased rear driving chains); yet the rear wheels of these machines are now among the very swiftest on the road to detach and replace.

Lubrication.

Once again experts point the finger of disdain to the average lubricating system. Few bearings have to bear the strain thrown upon the main bushes of a motor cycle engine; the strain on a modern ultra-efficient engine's crank pin is said to touch 3,000 lbs. per square inch for a fraction of a second in each cycle of operations. In the face of this, most makers are content with splash lubrication. In the hands of even a good driver the pendulum swings between repletion and starvation. In the hands of a rider who neglects the makers' instructions, things are necessarily worse. In some cases there is chronic starvation, with resultant bills running up to £3 for seized bushes; in others, the engine is liberally over-lubricated, and surplus carbon in the combustion head increases the compression ratio and the strains on the bearings. [An engine having forced lubrication throughout is described on another page.—ED.]

I do not regard the few tentative drip feed systems as being necessarily a great advance, though I have no right to criticise them without a longer trial. My experience of drip feeds is that if you adjust them rightly, the thick oil fails to feed regularly before it is warmed up, and that the engine is starved for the first few miles after starting, unless a separate charge be injected by hand at starting, and this not all owners can be trusted to do.

We stand in urgent need of some perfectly automatic system, as independent of the driver as the modern car system. I suppose most motor cyclists are aware how the average four-cylinder car engine is oiled. A little tray is fixed below the big end of each connecting rod, and a scoop fixed thereto picks up oil each time the big end comes down; this oil is flung all over the interior of the engine. The trays are kept filled with oil by a little mechanical pump, which takes up oil from a sump in the crank case; you put a certain quantity of oil in the sump every 1,000 miles or so, and in the intervals you forget you have an oiling system at all, unless the indicator on the dash becomes stationary, and shows that the pump has struck work—which is almost an unknown occurrence, since the pump is ensconced inside the engine, running in oil, so to speak, and miles away from dust and dirt.

Further refinements consist of separate oil leads to the very heart and centre of a few vital bearings, in the case of engines which throw a very heavy strain on their bushes; and also in some cases a device for lifting the oil trays when the throttle is fully opened, so that the scoops on the connecting rods sink deeper and pick up more oil. A filter is normally incorporated, both to remove foreign matter from fresh oil as it is poured into the sump, and to arrest any metal particles which get into the oil as it circulates through the engine week after week.

The contrast between the really very simple efficiency of such a system and the splash type of oiling we find on most motor cycles is appalling. The former is efficient, duffer-proof, emergency-proof. Ours are capable of being mishandled by experts—especially in these days of concealed hand pumps with valves at the foot. As engine efficiency is increased, the needs of the engine will force designers to provide what we private users already sigh for—an efficient automatic system, which is economical of oil. (On a recent 600 mile trip at high speed on a 3½ h.p. motor bicycle I used more oil than a relative's 20 h.p. car requires in 1,000 miles; and, in spite of this liberality, I seized my engine near the end of the trip!) I paid special attention to lubricating devices this week at Olympia, and shall have something to say about them later.

Cost of Running a 3½ h.p. Motor Cycle.

A Selection of Replies to a Recent Query.

Sir.—In reply to "H.M." [letter 6015], I bought a 1911 free-engine Triumph and sidecar last April, since when I have run 8½ miles solo and 2,240 miles with sidecar. I find that the average cost per mile works out at .809, say 3d.

That answers your correspondent's question, but I append a few explanatory details, which may be of interest. Total running costs, amounting to £10 10s., are as follow:

41 gallons petrol	£2 12 4
1½ gallons oil (approximate)	0 7 8
*New plug	£0 4 0
*New springs	0 6 3
New belts and fasteners (2)	1 12 6
*New tyre and tube	3 0 6
Tyre repairs	0 5 5
*New valve and grinding	0 4 10
Sundry	0 6 6
	6 0 0
Licences and registration	1 10 0

*Now carried as spares. £10 10 0

My solo running has been purely local—Cheshire and S.W. Lancashire—but with sidecar the country covered ranges from Gourock to Alnwick in the North, to Gloucester and Hertford in the South, and I find that petrol consumption averages 100 m.p.g. solo and 70 m.p.g. with sidecar.

I began as an utter novice with no mechanical or engineering knowledge at all. For over six months I never used the railway.

(Rev.) S. J. MARSTON.

Sir,—This question is a much-debated point, and my excuse for contributing to this topic would be due to its importance, and that a reader recently asked for actual running costs—under your endorsement.

Many letters from time to time, giving total (?) costs as not exceeding anything up to 1d. a mile, have appeared, and I think the incompleteness of such misleading statements calls for a fairer estimate. I have, therefore, prepared the following detailed statement, based on present market values and prices, and I venture to say it is quite representative; in fact, far more money could be spent, but very little less than that shown.

I would point out that a fourth column could be added to show the second-hand machine kept five years or so, which would be the cheapest policy possible, but it would come to very little less than 2d. a mile.

Annual total running cost, based on 2,000 miles a year:

[The distance ridden is very much below the average; this causes depreciation to work out at much too high a figure. —Ed.]

	Machine bought new for £48 and sold in 5 years for £18	Machine bought second-hand for £35 and sold in 12 months for £23	Machine bought new for £48 and sold in 12 months for £35

(a) Works out at 83½ miles per gallon, which allows for flooding, traffic riding, and waste, etc. H.A.J.S.

Sir,—In reference to "H.M.'s" letter [6015] I have kept a record of the cost of running a 3½ h.p. motor cycle during the past six years, and think it may be of interest. The costs may seem high to some, but, considering that most of the running has been in a hilly part of Durham and between

there and West Cumberland, with a generous share of ill-luck, both mechanical and with tyres, I think it fairly reasonable, and both machines work out about the same rate. In the last two years I have used a sidecar for a total distance of about 1,400 miles, which accounts for the higher cost per mile.

	£	s.	d.	Miles run.
1906. Second-hand 3½ Kerry	18	14	6

= 1.35d. per mile.
= 1.3d. per mile.
DC97.

Sir,—I took delivery of a two-speed Humber in April last. My mileage to date is 4,500 miles, chiefly in the Midlands and the North of England, not more than 200 with a sidecar.

In addition to the cost of machine (£50) I have spent £17 10s. upon it as under:

Licences	£1 10 0
Overalls	1 15 0
Lamp, horn, whistle, and watch	2 17 6
Extra toolbag and spare tube	1 0 0
New cover and belt	3 10 0
Petrol, 50 gallons	3 0 0
Oil and carbide	1 0 0
Sundry spares, outfits, repairs, etc	2 4 0
A.A. subscription	0 13 6

£17 10 0

Running expenses may be reckoned at from 1d to 1½d. per mile, depending upon what is allowed for depreciation.

GEO. E. QUINCEY.

Sir,—As you invite readers to publish their motoring balance-sheets, and as I have just got mine out for my own edification, I give it below. You will notice one item I have included—fines. In these days of special attention on behalf of the police to our body, and as even the most careful driver is liable to fall foul of them sooner or later, I have decided that it should be a fair charge (pecuniary) against the pastime.

Machine, 3½ h.p. clutch 1911 model, well-known make	£55 0 0
Horn and lamp	3 11 0
Speedometer	4 4 0
Spare valves	0 10 6

	£63 5 6
Depreciation on above, say	12 0 0

Small repairs and sundries	1 3 3
Small additions and alteration	0 17 0
Fines	1 14 6

£21 14 3

Mileage, 3,200. Cost per mile, 1.73d.

EDGAR REWN.

THE SINGLE-CYLINDER SIDECAR OUTFIT.

By B. H. DAVIES.

OPINIONS seem to differ as to the practicability of a single-cylinder outfit. Mr. Hugh Gibson shows imperfect logic in arguing that the popularity of such outfits proves their perfection. He might as well infer that the 1907 solo mount is as good as the 1911, because there are thousands of 1907 machines on the road. It is largely a matter of cost.

Hundreds of riders use $3\frac{1}{2}$ h.p. single-geared sidecar outfits because they can afford nothing better; if these men got a £100 rise in income, most of them would probably go in for a big Clyno, Chater-Lea, Bat, or Indian outfit, with a twin-cylinder engine, a chain drive, and a two or three-speed gear.

The fact is that a clever rider can get a lot of fun with a $3\frac{1}{2}$ h.p. single-geared outfit. Did not I once tour round Devon on a $2\frac{3}{4}$ h.p. belt-driven tricar and a load of 26 stones? Does not my friend Bischoff annually take a sidecar round Scotland with his $3\frac{1}{2}$ h.p. Triumph? But it is not every rider who can get good results with such limited material; and, personally, I infinitely preferred driving my old 9 h.p. Riley tricars, which would storm up absolutely any hill on bottom gear, and would only call for this for forty yards of Sutton Bank.

THE MOTOR CYCLE IN CANADA.

Four Miles from Orangeville, in the Caladon Mountains, Ont., Canada.

Briefly, one may say that the $3\frac{1}{2}$ h.p. single-geared outfit is quite possible. You need an adjustable pulley and two or three belts, and you must be prepared to drop your passenger on many hills if you visit the mountainous country where the real scenery lies, and even minus a passenger you may occasionally have a rare struggle to surmount a hill. If you add a two-speed gear with a low ratio of about 7 or $7\frac{1}{2}$ to 1, you can take your passenger up all ordinary hills, without fooling round with dirty belts and a possibly reluctant pulley; or, again, if you get a chain-driven machine, with a low gear of 9 or 10

to 1, you may just coax it up real bad hills with a passenger on board.

My experience is that the crying need of the single-cylinder outfit is a *multi-speed* gear. The average owner, who is not a first-rate tuner, cannot climb long easy slopes like Hindhead on top gear; and the protracted grinds on bottom gear set more men against single-cylinder passenger outfits than anything else. Either you have to race the engine, which implies noise, vibration, and rapid wear, or you have to creep up, sternly throttled down, at 10 m.p.h.

The three-speed gear will enormously popularise $3\frac{1}{2}$ h.p. sidecar work, for the direct drive would be fast and quiet. Moreover, an ideal three-speed gear for passenger work, in my opinion, should embody chain transmission. We get good results with a variable gear and belt transmission in bad weather with solo mounts.

Wanted, a Weatherproof Transmission.

A motor cycling acquaintance, residing in a level southern county, told me recently he should sell his $3\frac{1}{2}$ h.p. belt-driven single and get a shaft-driven F.N. for the winter. His dislike of belt troubles is perhaps exaggerated, for he never uses a sidecar. But his prejudice shows that an all-round sidecar outfit requires a more weather-proof transmission than the belt. But the sidecar market is abnormally complex.

A host of men who use belt-driven $3\frac{1}{2}$ h.p. sidecar outfits frankly admit their defects. But they say: "I cannot afford two machines; I do a lot of solo riding, and when I go out minus the sidecar I want a light, simple, fast machine—a T.T. roadster in fact!" If they bought their mounts solely for passenger work, they would go in for the less simple leviathan types. I reiterate that a good chain-driven three-speeded $3\frac{1}{2}$ h.p. would be enormously popular among sidecarists. Many have been waiting till the Show. There have never been so many good sidecar outfits there. Perhaps the gear question will also be definitely solved.

Up in the Caladon Mountains, 48 miles from Toronto. All the machines are Triumphs.

**ROYAL ENFIELD, No. 39.**

6 h.p. MODEL: 76 × 85 mm. twin-cylinder; m.o. side by side valves; Amac carburetter; chain transmission throughout; Enfield two-speed counter-shaft gear.

THE ENFIELD CYCLE CO., LTD., Red-ditch.—The 6 h.p. Enfield is specially constructed for sidecar work. It is fitted

Enfield twin valve lifters.

with an enlarged and strengthened Enfield two-speed gear with rubber cushioning device for taking the shock of the drive. Improved handle starting has been fitted for 1912. A 650 × 65 mm. back tyre is adopted to take the strain transmitted to the rear wheel of a combination passenger machine. Drip-feed lubrication is employed to the engine. Neat rubber-covered footboards are fitted, and the gear control is operated from a handle

Method of operating the two-speed Enfield gear.

fixed to the top tube. A new feature of this model is the easily detachable rear mudguard and carrier which facilitate tyre repairing. We described this model in detail on October 26th, since when no important alterations have been made.

THE second annual exhibition at Olympia of motor cycles and accessories was thrown open to the public on Monday last at 10.0 a.m. It is bigger, more complete, and better arranged than its predecessor, and the exhibits as a whole show a striking advance in finish and ingenuity. The floor of the Hall is packed with motor cycles of all sorts, the majority, if not all, possessing some new points in their design. Actual as well as potential motor cyclists will find much to attract their attention, both on the floor and in the gallery where the accessories are displayed. No reader who can conveniently attend should miss this opportunity of examining the very latest ideas in motor cycle design.

Our descriptions of the exhibits have been written by our own staff after a stand to stand tour of the Show, a specification of each different model preceding the comments.

SPECIAL NOTE.

A number of 1912 models have been described and illustrated in recent issues, and for ease of reference we give the dates on which they appeared:

- Oct. 19. Multi-speed Rudge, Bowden counter-shaft gear, and 3½ h.p. Premier.
- Oct. 26. 6 h.p. Enfield sidecar, 2½ h.p. Calcott, Douglas, Brown and Hingston gear, and Motosacoche.
- Nov. 2. Two-speed Triumph, ladies' Premier, Kynoch, Hazlewood, Levis, Alldays, Puch, and N.S.U.
- Nov. 9. Two-stroke Stuart, 3½ h.p. Singer, Canoelet sidecar, Veloce, Brown, Indian, F.N., Midget-Bicar, Zenith-Gradua, New Imperial, Triumph, and Forward. Illston-Smith and Precision engines.
- Nov. 16. A.J.S., Edmund spring frame, Rex, A.S.L., N.S.U., Clyno, New Hudson, 2½ h.p. Enfield, Excelsior, L.M.C., Bradbury, P. and M., Bat, B.S.A., Scott, Matchless, P.M.C., Sturmeys-Archer gear, and A.C. Sociables.

2½ h.p. MODEL: 54 × 75 mm. twin-cylinder; side by side m.o.i.v.; Amac carburetter; chain transmission; Enfield two-speed gear.

This model was described in our issue of November 16th, and it is only necessary to remind our readers that it can be supplied with either single gear or the Enfield two-speed (in this case operated by pedals on the footboard). It is fitted with a new handle-starting device, and it will be remembered that on the 2½ h.p. model the valves are disposed in pairs, behind the rear V cylinder and in front of the front cylinder.

"Cash" drive embodied in the rear chain wheel of the Enfield. The tapered portions are rubber blocks to soften the impulses of the engine.

2½ h.p. MODEL: 64 × 74 mm., single cylinder; side by side m.o.i.v.; Amac carburetter; chain; Enfield two-speed gear.

The 2½ h.p. lady's model was also mentioned in the issue of November 16th. In this case also the gear is foot-operated, but a lever is fitted on the handle-bar to enable the gear to be put in the neutral position while the rider takes her seat. The rubber-cushioning device is fitted to this model as a standard. Mudguarding has been carefully studied in all models, and side flaps are fitted to both front and rear guards.

The Olympia Show.—

„The Morgan runabout chassis. Note the laminated rear springs.

MORGAN RUNABOUT, No. 127.

8 h.p. MODEL: 85 × 85 mm.; side by side m.o.v.; B. and B. carburetter; chain; two speeds; dog clutch counter-shaft.

MORGAN AND Co., Worcester Road, Malvern.—Four models are shown—two single-seaters and two sociables—also a chassis without body. The magneto is placed in front of the engine and driven by bevel wheels. The single-seaters are

Front view of the Morgan runabout showing the enclosed engine and method of front springing.

tiller steered, the throttle and gear levers being placed on the left-hand side of the body. The sociables are steered by wheels, which also carry the operating levers. The clutch, which is leather-to-metal, is operated by a pedal; a second pedal works one of the brakes. The second brake is brought into play by a hand lever. These machines made their

appearance at last year's Show, and since that time have made a very high reputation in numerous trials, both for speed

The 2 1/2 h.p. variable geared Motosacoché.

and reliability. The grey finish with dark lines gives a very attractive appearance. These runabouts are quite in the front rank of self-contained passenger motor cycles.

Near side of the single-seater Morgan runabout, in its latest form.

MOTOSACOCHE, No. 36.

2 1/2 h.p. MODEL: 64 × 90 mm.; side by side in front valves; Motosacoché carburetter; belt transmission; expanding pulley gear and jockey pulley.

MOTOSACOCHE, LTD., 65, Holborn Viaduct, E.C.—The 2 1/2 h.p. Motosacoché has undergone several important improvements for the 1912 season. It will be noted that the engine has an increased stroke while another important feature is the fixing of the exhaust pipe, which is brought to meet the cylinder instead of having the cylinder port brought out to meet the pipe. This obviates a large mass of metal and considerably improves the cooling of the engine. The special feature this year is the new variable gear. A double pedal on the left footrest operates an expanding pulley on the engine-shaft, while a jockey pulley operated from the handlebar takes up the slack of the Whittle belt. In this year's model the engine and tank are no longer carried on a separate chassis

but are fixed to the main frame, thus allowing a larger tank, considerably improving the appearance, and giving greater accessibility all round. An improved fixing is used for the side metal guards covering engine, etc.; these are hinged to the tank and prevented from rattling by clips carried on the crank case. Mudguarding has been particularly well carried out, large side flaps being fitted to both wheels. A foot brake is fitted on the belt rim, and has a simple adjustment to compensate for wear on the shoe. The control levers of the magneto and automatic carburetter are placed on the left handlebar, and an extra air lever is situated on the left side of the tank. The tank is finished in aluminium with a black panel, suitably lined, and carries petrol and oil gauges where they can be conveniently seen without detaching the side guards. The neat and strong method of attaching the engine to the frame was mentioned in a recent issue. It is worth noticing that the addition of a variable pulley gear adds only 2 1/2 lbs. weight to the machine.

The Olympia Show.—

2 h.p. OPEN-FRAME MODEL: 62 × 75 mm.; automatic inlet over exhaust valve; Motosacoche carburetter; belt transmission; Motosacoche expanding pulley gear and jockey pulley.

The 2 h.p. lady's Motosacoche is very neatly arranged, and is particularly light, both in appearance and actual weight. Dress-guarding has been carefully studied. The chief features of this model are the Druid forks, 24in. wheels, variable gear operated from the handlebar, and the 2 h.p. engine, which is fitted

the front or rear wheel. The magneto is carried in a separate compartment underneath the driver's seat.

V.M.C., No. 58.

2½ h.p. MODEL: 68 × 76 mm.; outside flywheel; B. and B. carburetter; belt transmission; V.M.C. two-speed gear.

VELCE, LTD., Fleet Street, Birmingham.—This is one of the most up-to-date bicycles in the exhibition. The two-speed gear and clutch are incorporated in the engine, forming one unit. The clutch of the double cone type is capable of being

through the tank, showing the rider that the lubricant is flowing properly. In case of an excess of pressure, a plunger is forced upwards, uncovering an extra hole, so that the excess flows back to the reservoir. The oil is then passed through a

V.M.C. pedal control of two-speed gear by means of a pulley and wire.

passage in the crank case on to the gear-shaft, the gear wheels, and clutch operating mechanism. A hole in the cam is so arranged that it allows oil to be sprayed in the cups on the connecting rod, whence it passes into the cylinder and to the gudgeon pin. The gear wheels always run in an oil bath, the level of which is kept constant by the oil pump. Care has been taken to avoid leakage of oil in the joints and bearings. Sufficient oil is carried in the crank case for over 200 miles. The diameter of the driving pulley is 6in., so that an efficient belt drive is provided. The whole of the tank is devoted to the carrying of petrol, and there is room for 1½ gallons. The frame is dropped at the rear, and follows standard lines. The magneto is carried forward, and is well protected by means of a shield.

OSMOND-PRECISION, No. 20.

3½ h.p. MODEL: 85 × 88 mm.; side valve; B. and B. carburetter; belt.

OSMOND, LTD., Sparkbrook, Birmingham.—Two motor cycles, both fitted with 3½ h.p. Precision engine. The machine is on standard lines, and presents no special features, except that it is soundly constructed throughout. Druid forks are employed, and the front mudguard has side flaps extending from the crown head nearly to the bottom of the wheel.

2 h.p. open-frame Motosacoche, the ladies' favourite

with an atmospheric valve disposed over the exhaust valve. No cam gear in the ordinary sense of the word is employed, but the original system of Motosacoche valve operation by which the valve tappet is operated by a shoe sliding in grooves cut on the flywheels. On this model a Lycett rubber belt is used for the fixed gear, and a ball race is fitted to the bottom of the pulley, so that when the pulley is fully expanded a free engine is obtained without any drag. If the variable gear is specified the Whittle belt is used as on the men's machine. In other respects the ladies' model remains practically unaltered.

SWAN, No. 91.

3½ h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; chain; two-speed gear.

THE SWAN MOTOR MFG. CO., Frodsham, near Warrington. This machine is a distinct departure from the standard. The main portion of the frame is of a heavy gauge sheet steel. The rear forks are tubular, and are suspended on laminated springs. The oil tank is carried in the front adjacent to the head, while the petrol tank is carried to the rear beneath the driver's seat. This seat is of the pan type, and is provided with a heavily padded cushion. The only parts of the mechanism which are visible to the eye are the cylinder and the carburetter, the crank case, etc., being entirely enclosed. Footboards of ample size are provided, as also a stand, which raises

moved to either side, so that either one or other of the gears is put into action. Only six gear wheels are required, including the magneto and gear pump drive. The gears are operated by means of a pedal. Lubrication is arranged on thoroughly up-to-date lines—a rotary oil pump, driven from the end of the magneto-shaft, draws oil from the sump and the crank case to a large filter inside the crank case, which on its way passes through an indicator, raising a light rod passing

The open spring-frame Swan motor cycle—one of the novelties at Olympia.

The Olympia Show.—

MILLFORD, No. 65.

MILLS AND FULFORD, LTD., Coventry.—This firm, one of the oldest and best known sidecar manufacturers in the country, have introduced several improvements for this year. As regards the frame, the longitudinal member nearest the bicycle is now made in one piece, with double swan neck bends, which bring it up to the down tube of the machine. This tube is telescopic, and may be adjusted to suit any length of wheelbase, while the clip attached to the machine can be moved backwards or forwards so that the necessary width may be obtained. The clip fastening to the chain stays of the machine is also capable

A folding luggage under-carrier fitted to a Millford sidecar. It is the invention of the Rev. J. Haslam.

of universal movement. The tube it carries is suspended at two points, firstly on the main longitudinal member nearest the machine, and also on another tube parallel to it. By loosening the necessary bolts it may be slid backwards or forwards on these two tubes so as to adjust itself to the required length. The clip attached to the bolt fixed to the chain stays is capable of up or down movement so as to adjust itself to the height of the machine, allowing a 28in. wheel machine to adapt itself comfortably to a

The new Millford coach-built sidecar with radiator spring wheel.

26in. wheel sidecar. In whatever position this clip may be turned, it is firmly secured by an ingenious device. The securing bolt runs through two tubes halved and grooved to adapt themselves to the diar of the tubing, so that when the nut is screwed up the two halves grip the tube and lock the bolt securely. The bar supporting the body has a cross member brazed to it, so that the body is now supported fore and aft. No fewer than fifteen different types of bodies are shown on the stand. Some are made of wicker, others of cane, whilst several are of the coach-built variety.

CHATER-LEA, No. 112.

8 h.p. MODEL: 85 × 85 mm.; m.o.v. side by side; Amac carburetter; chain transmission; three-speed Chater-Lea gear.

CHATER-LEA, LTD., Golden Lane, E.C.—This stand is taken up with the display of 8 h.p. Chater-Lea sidecar models, which have performed so well in competitions during the past season. The engine is of Chater-Lea manufacture, and is on similar lines to the J.A.P., though it differs considerably in the arrangement of the timing gear. The crankshaft carries a large metal-to-metal disc clutch having twenty-nine plates. From this the drive is taken to a three-speed gear box, supported behind the engine by the chain stays, through a $\frac{7}{8}$ in. × $\frac{3}{4}$ in. Renold chain. On the same side the final driving chain is taken to the

Power plant of the Chater Lea runabout, showing the 8 h.p. twin-cylinder engine, the cone clutch, and magneto drive.

back wheel. The brakes are very large and designed for sidecar work, the rear one being a metal to metal contracting band on the right-hand side of the hub. The gear change is operated by a horizontal lever working in a quadrant on the top tube. Special attention has been paid to giving sufficient tank capacity, there being a petrol capacity of two gallons and a half and oil half a gallon. The machine is fitted throughout with ball bearings. Lubrication is by hand pump, the tank

being placed immediately underneath the saddle. The back wheel is shod with a 650 × 65 mm. voiturette tyre. The sidecars themselves well repay inspection, and in wicker-work, cane, and coachbuilt finish are very neatly turned out.

BRADBURY, No. 116.

$3\frac{1}{2}$ h.p. MODEL: 89 × 89 mm.; m.o.v. side by side; B. and B. carburetter; chain; Bradbury two-speed gear.

BRADBURY AND CO., LTD., Wellington Works, Oldham.—The range of models shown on the Bradbury stand is ex-

Combined lamp and generator bracket on the 1912 Bradbury.

tremely complete, as in addition to the two-speed chain-driven model specified above, which has been fully described in *The Motor Cycle*, there are no less than four others, viz., a belt-driven single-gear machine, a T.T. model on similar lines, a two-speed belt-driven mount with N.S.U. engine-shaft gear, and a belt-driven clutch model with Villiers hub clutch. The T.T. model is an extremely neat little machine with shortened wheelbase, low frame, dropped handle-bars, and large engine pulley. The foot brake is arranged on the bottom bracket, and is large and immensely powerful, being operated by the heel. This model is fitted with fixed girder forks, but spring forks can also be supplied. Large side flaps are fitted to the front mudguards on all models, and a commodious square tool box is carried on the top tube. The magneto is the latest type Bosch.

The 1912 model T.T. roadster Bradbury. Observe the tool-case on top tube.

The Olympia Show.—

CLYNO, No. 83.

5.6 h.p. MODEL: 76 × 82 mm.; m.o.i.v. side by side (enclosed); Amac carburetter; chain; Clyno two and four-speed gear.

THE CLYNO ENGINEERING CO., Pelham Street, Wolverhampton.—The 5.6 h.p. Clyno has proved itself to be one of the most successful passenger machines on

New design Clyno footplates and brake pedal.

the market, as the recent experiences of one of the staff of *The Motor Cycle* on Porlock Hill amply proved. The chief features of the machine—the enclosed valves, the enclosing of the driving chains in aluminium cases, and the

Clyno method of carrying a spare tyre. The cover is merely stretched over the hooks.

simple form of change-speed mechanism by internal expanding clutches—are well-known to our readers. The gears are suspended on a special carrier which can be dropped away by undoing the necessary bolts, while provision is made for adjusting the clutches easily with the aid of a screwdriver. The chief improve-

ments for 1911 consist of a kick starting device and a four-speed gear which may be had at a small extra cost. The four speeds are obtained merely by the

on the near side of the front of the square frame to a point on the down tube immediately below the secondary tube of the frame. Those who are interested in

Accessibility to the engine and gear of the Clyno sidecar has been well studied. The body may be lifted up as shown.

addition of one extra chain and clutch. The cylinders exhaust into two expansion chambers which are connected with a long exhaust pipe (extending to a point behind the rear axle), which is flattened at its rearward end, causing the exhaust to be exceedingly silent. The Clyno sidecar is also worthy of special mention; the comfortable coach-built body is suspended at the rear on Cee springs, and at its forward end on an inverted transverse semi-elliptical spring. The frame is square shape and entirely surrounds the body. The sidecar is carried separately in an extension of this, so that the axle is supported on both sides. The rigidity of the attachment is considerably improved by the addition of an extra stay to the down tube of the bicycle. Of these two stays one runs from the longitudinal member nearest the bicycle to a point on the down tube level with the top of the front cylinder, while the other is hinged from a point

machines specially constructed for sidecar work should make a special point of visiting this stand.

NEW IMPERIAL, No. 42.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Roc two-speed gear.

THE NEW IMPERIAL CYCLE CO., LTD., Lower Loveday Street, Birmingham.—This company is showing a neatly carried out 3½ h.p. model fitted with a Villiers hub clutch. The engine used is a 3½ h.p. Precision. The machine is on standard lines, and has a dropped top tube which gives an extremely low saddle position. Mudguarding has received special attention, side flaps being fitted on the mudguards to both front and back wheels, while a large shield is fitted over the magneto, which lies in front of the engine. Both brake and clutch pedals are carried on separate lugs. Handle-bar controlled magneto is employed, and all lugs,

(1) Valve side of the 1912 Clyno, showing valve covers, magneto position, foot plates, and method of operating gears.

(2) Gear side, showing the improved foot starter. The enclosed chains give the Clyno an exceedingly neat appearance.

The Olympia Show.—

including those carrying the carburettor and magneto controls, are brazed to the frame and handle-bars. A special fitting is the ratchet exhaust lift. The machine shown is finished throughout in transparent bronze, there being no nickel fittings with the exception of the saddle pillar and a few nuts and bolts. This finish gives the machine a particularly neat appearance, and should make it extremely waterproof.

4½ h.p. MODEL: 90 × 96 mm.; side by side; B. and B. carburettor; belt; Roc two-speed gear.

This model is specially built for sidecar work, and has a frame designed throughout to withstand the extra strain of the attachment. The description of the 3½ h.p. machine applies to this model also, with the exception of the fact that it is finished in green tastefully lined with black and a paler green. Two pairs of footrests are fitted to the 4½ h.p. model, the rear footrests taking the place of the pedalling gear on the 3½ h.p. type. Druid spring forks are employed throughout, and neat V-shaped handle-bars with a cross tie-rod.

2½ h.p. MODEL: 70 × 76 mm.; side by side; B. and B. carburettor; belt; Armstrong three-speed gear.

The 2½ h.p. model is fitted with a loop frame and has the Armstrong three-speed as a standard fitting, but free engine or fixed gear can be supplied if required. The finish is in black with a green and white panel tank. In other respects this machine resembles the 3½ h.p. These types have been described in detail in a recent issue.

CALTHORPE, No. 77.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburettor; belt.

THE CALTHORPE MOTOR CYCLE CO., Barn Street, Birmingham.—This is a standard 3½ h.p. model, with drop frame, Druid spring forks, and a stand which when out of use springs up automatically into position.

2½ h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; B. and B. carburettor; belt.

This machine follows standard lines throughout, except that it is shown fitted up in Tourist Trophy style, with dropped handle-bars and footrests.

The 3½ h.p. New Imperial. This machine has what is known as an "oil" finish.

4½ h.p. MODEL (Special Sidecar): 90 × 96 mm.; side by side m.o.i.v.; B. and B. carburettor; belt and chain; Calthorpe two-speed gear.

The 4½ h.p. mount is specially constructed for sidecar work. Free engine to gear box the transmission is by chain enclosed in a gear case. The gear box is carried on the bottom bracket. The gear wheels are always in mesh, and engagement is effected by means of internal expanding clutches brought into operation by a long lever at the side of the tank. The driving pulley on the gearshaft is of large dimensions, so that the wear of the belt is reduced to a minimum. Wide footboards

are provided. One of these machines is shown fitted to a sidecar provided with a handsome coach-built body, with high side door and Cape cart hood and screen. In the dashboard shelves are provided for tools, and at the front of the seat a further locker is provided for this purpose, while

under the sidecar frame is a platform for luggage, and beneath it a special holder for a petrol tin. It must also be mentioned that this outfit is provided with a special carrier for a spare cover, which is placed between the machine and the sidecar.

PUCH, No. 90.

3½ h.p. MODEL: 76 × 100 mm.; side by side m.o.i.v.; B. and B. carburettor; belt.

THE PUCH MOTOR CYCLES AGENCY, Notting Hill Gate, W.—The Puch machine makes its public appearance in England for the first time at this exhibition. The makers, it will be seen, favour the long-stroke engine. The exterior finish is particularly good. An under-gear pulley is fitted, and the tension

Jockey sprocket on the Puch sidecar machine, showing the bracket and wing nut for adjustment.

of the belt may be varied by means of a handle placed at the side of the tank. By the aid of this handle the belt may be so much slackened that the engine is free, and after it has been started by the pedals the pedal on the spring-up stand may be depressed and, while the rider is still in

model two-speed Calthorpe, with comfortable coach-built sidecar.

The Olympia Show.—the saddle, the stand will fly into position and the engine may be started by gradually tightening the belt. The frame of

machine is rigid at the rear. The change of speed is effected by a lever provided with a wood handle adjacent to the saddle, while opposite to it is a ratchet

the improvements which may be noted are the size of the petrol tank and the provision of a foot engine starter. This is extremely neatly designed, and is arranged to be absolutely proof against the likelihood of danger from back firing. The pedal bracket for this purpose is attached in front of the crank chamber, and drives a claw clutch sprocket on the crankshaft through a chain. This claw clutch is held out of engagement with its meshing teeth by mechanical means, except when the engine is being started. The large sprocket is fitted with an ingenious pedal clutch arrangement which in the event of a back fire occurring causes the pedal to be thrown free. Both models are supplied with single gears and free-engine clutches, this clutch being operated in all types by a lever placed on the right-hand side of the machine and frictionally held to a quadrant. In the two-speed geared machines the clutch has been considerably increased in frictional surface. The chain from the counter-shaft to the back wheel is covered

The new 2 h.p. Puch, showing position and novel method of driving the magneto.

this machine is sprung both at the rear and front on spiral springs enclosed in tubes.

2 h.p. MODEL: 68 x 70 mm.; m.o.i.v.; B. and B. carburetter; chain.

The valve, gear, magneto (which in all cases is the Ruthardt), and oil pump are driven by skew gearing, the shaft of which runs at the side of the crank case. It may be mentioned that an additional pump is supplied for injecting the

The Puch two-speed gear and clutch operation, also showing vertical tube of spring frame.

necessary amount of oil into the crank chamber. The transmission is by single chain, and in the rear hub is a multiple disc clutch. A 2 h.p. machine is also shown fitted with direct belt drive and chain-driven magneto. In all cases the magneto is at the rear.

6-7 h.p. MODEL (Twin): 80 x 90 mm.; a.o.i.v.; B. and B. carburetter; single chain; epicyclic two-speed gear.

This is quite a practical sidecar machine. A pulley is fitted to the end of the engine-shaft for the purpose of driving the fan, which is enclosed in a casing, the outer part of which is covered with wire netting. The frame of this

brake lever controlling an external band brake on the rear hub. The sidecar is provided with a motor car type of wing, capacious cylindrical petrol tank at the back, and a sprag which may be used as a stand. The two cylinders exhaust into an expansion chamber, and thence runs a long pipe in easy curves, which is bolted to the sidecar frame, and terminates in another expansion chamber. The handlebars are of great length and are supported by means of additional stays. The machine is a distinct departure from English ideas, and is well worth a close inspection.

INDIAN, No. 107.

7 h.p. MODEL: 82½ x 93 mm.; m.o. overhead inlet valves; Indian carburetter; chain transmission; two-speed Indian counter-shaft gear.

HENDEE MFG. Co., Great Portland Street, W.—For next year two types of Indian machines are being made, viz., the 3½ h.p. single and 7 h.p. twin, both of which are alike in all respects except the number of cylinders. The standard colour of the machine is blue. Amongst

Laminated spring fork of the new Indians.

with a neat, quickly-detachable case. Both brakes are on one side of the rear hub, one being an internal expanding metal-to-metal type and the other a contracting band lined with Raybestos. This arrangement considerably facilitates the removal of the back wheel when necessary. The carburetter on all models is the well-known Indian, with annular float chamber and fitted with a pilot jet for slow running. A novelty in connection with the 1912 Indian is the folding footplates.

The 1912 7 h.p. Indian racer.

The Olympia Show.—

RUDGE-WHITWORTH, No. 115.

3½ h.p. MODEL: 85 × 88 mm.; mechanical valves; B. and B. carburetter; belt; Rudge-Whitworth variable gear.

RUDGE-WHITWORTH, LTD., Crow Lane, Coventry.—Six models are shown on this stand, two as above, two T.T. machines,

the Bowden cable is used to push instead of the inner cable being used to pull. Both the valve springs are fitted with an ingenious and novel cotter, the great advantage of which is that, owing to the pin itself being only in compression, there is practically no chance for it to break. The dished spring washer used with this device also allows a slightly longer spring. The silencer has been improved, and is

comes close to the footrests, is a special asbestos-lined shield to protect the rider's boot. In the case of both the above models the rear mudguard is so constructed as to clear the movable portions of the rear forks. In all cases the

The 3½ h.p. multi-speed Rudge in its latest form.

and two tourist models with Rudge clutch on the engine-shaft. Among the improvements which have been carried out on all the machines are shorter pedal cranks on the starting gear axle, giving a comfortable alternative footrest position; a larger belt rim brake which is self-aligning and bears uniformly on the rim over the whole surface of the shoe. Two methods of adjustment are provided, so that an almost unlimited amount of wear can be taken up. The appearance of the machine has been considerably improved

furnished with a large foot-operated cut-out. The holes in the silencer are arranged so that the exhaust does not disturb the dust.

A.S.L., No. 103.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; Amac carburetter; belt; N.S.U. two-speed gear.

A.S.L., LTD., Corporation Street, Stafford.—This machine has a Precision engine. The frame is suspended on Sharp's air springs. A description of a run on this machine was recently referred to in these pages. 22in. wheels may be employed, and they serve to bring the

Petrol injector employed on the A.S.L.

spark lever is handle-bar controlled. Other specialities are a special cushion seat, an adjustable pulley, and a Best and Lloyd semi-automatic lubricator. One of the twins is shown with a sidecar.

A.J.S., No. 128.

2½ h.p. MODEL: 70 × 82 mm.; side by side; Amac carburetter; chain; two speeds on counter-shaft.

A. J. STEVENS AND Co., Retreat Street, Wolverhampton.—Three of these models are shown. They are this year

A.J.S. change-speed quadrant.

fitted with footboards, and the brake is operated by the heel. The change speed lever is on a lug brazed to the top tube, and a foot starter can be fitted as an extra. Another 2½ h.p. model is shown with a belt drive.

5 h.p. MODEL: 70 × 82 mm. twin; side by side; Amac carburetter; chain; two-speed counter-shaft.

There are two models of greater power. These models include a kick starter as a standard and 2½in. tyres. Both models

The front fork and rim brake on the new 3½ h.p. Rudge.

Silencing arrangement on the new twin A.S.L.-Fafair. Note the shield to keep the rider's foot off the exhaust pipe.

rider's weight as near to the ground as possible. The wheels are tyre with Moseley ribbed covers, specially manufactured for the firm, and Bosch magnets are supplied, while both front and rear brakes are of the external contracting band type.

5-6 h.p. MODEL: 70 × 80 mm. Fafair; side by side m.o.i.v.; Amac carburetter; belt.

The exhaust pipes of the twin-cylinder lead into an expansion chamber, from which there issues a long pipe of large size flattened at its rearward end. Attached to the rear exhaust pipe, which

by the substitution of a plain curved chain stay in place of the usual type, which is cranked round the belt rim. An inverted lever operates a new type of exhaust valve lifter, which is extremely neatly arranged, a rather noticeable feature being that the outer covering of

The Olympia Show.—

are fitted with neat petrol primers and the well-known A.J.S. friction clutch; they also have Druid forks. The arrangement of the toolbag is especially neat. This slides bodily into a metal case placed under the carrier, which also supplies the place of a number plate. These machines were fully described in our last issue.

ZENITH-GRADUA, No. 79.

3½ h.p. MODEL: 85½ × 85 mm.; m.o.i.v.; B. and B. carburetter; belt; Zenith-Gradua gear.

ZENITH MOTORS, LTD., Weybridge.—The chief feature of the 1912 Zenith is the new system of attaching the back wheel, which allows the latter to be removed instantly. The details of this interesting system appeared in *The Motor Cycle* issued on November 9th. Though the improvement is seemingly a very small one, it is none the less of great importance, and we may mention that models are shown on the stand which serve to show how quickly the rear wheel may be removed. The finish of these machines is of the best, and their many successes on the road are a proof of their excellence. The machines are particularly well equipped. A well-

Shield over the Zenith-Gradua duplex chain and gear operating mechanism.

designed luggage carrier is fitted, terminating in a V, which carries the number plate and a reflex rear light. The top side of the gear operating chain is now provided with a guard. Spacious tool-bags which incorporate an inner tube case are supplied. Side wings are now fitted to the front mudguard, while the rear guard is enclosed on the off side, and is of ample dimensions. In all other respects this excellent machine remains unaltered.

Except for the fact that a 6 h.p. engine is fitted, the details of the twin model are the same as above. A working model of the Gradua gear is shown on the stand, and a large number of machines, some with sidecars.

P.M.C., No. 108.

6 h.p. MODEL: 76 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; two-speed hub gear.

THE PREMIER MOTOR CO., LTD., Aston Road, Birmingham.—Two models of the Rex-Jap machine, which may be described as being Rex motor cycles with the exception of the engine, are shown, one conforming with the specification above and the other being an 8 h.p. model with 85 × 85 mm. engine. The

Bosch magneto is placed immediately behind the crank case. The two-speed gear is made under Roc licence, and enables the engine to be started by handle with the wheel on the ground. Automatic drip-feed lubrication is provided. The tank is of a sensible and large size and is painted in distinctive colour.

Shown on this stand, and intended for use with these models, is a very fine example of a coach-built sidecar, a great feature of which is the extraordinary lightness. The sidecar wheel is sprung on a pair of quarter elliptic springs furnished with radius rods, so that it is impossible for the wheel to get out of alignment. An excellent feature in this arrangement is that for an extra heavy passenger the springs can be slid along the clips so as to be greatly stiffened. The frame of the sidecar is extended backwards, and supports a large luggage grid and also a carrier for a spare cover. This sidecar is fitted with very quick detachable fittings, which allow the combination to be assembled or erected in less than one minute.

6 h.p. MODEL: 95 × 102 mm.; fore and aft m.o.i.v.; J.A.P. carburetter; chain; hub two-speed epicyclic gear.

The Motorette three-wheeler is shown in two types, both for passenger work and commercial use. The engine is water-cooled, the radiators being placed on each side of the bonnet, which is immediately behind the side-by-side passenger seats. In front of each is a scuttle dashboard with hinged flap, carrying a wind screen. The engine case is surmounted by a large luggage carrier. Lubrication is of the semi-automatic type, a large supply of oil being carried in a separate tank, from which it is forced by a hand pump into the engine sump. The flywheels are cast with large fan blades, which induce a draught of air through the vertical tube radiators.

DOUGLAS, No. 114.

2½ h.p. MODEL: 60 × 60 mm.; side by side m.o.v.; Douglas carburetter; chain and belt; Douglas two-speed counter-shaft gear.

DOUGLAS BROS., Kingswood Bristol.—Most of the many Douglas improvements

have been fully illustrated and described in recent issues. Two models in addition to the above are shown, viz., a fixed gear machine with chain drive to the counter-shaft, and belt drive to the back wheel, the belt in all models being carried on the right-hand side of the machine. The third model is of the open frame type, and is intended primarily for ladies' use. The design is thoroughly neat and work-

Douglas open frame, model showing gear control lubricator gauge and glass filter, as seen from saddle.

manlike looking. The frame is considerably strengthened by having a double diagonal tube which in the front supports the oil and petrol tanks and lower down the casing which completely covers the engine. In this casing there is a trap door through which the back cylinder can be primed. The engine cover entirely prevents the possibility of a skirt becoming entangled with the flywheel. This machine has a two-speed gear and foot starter, both of which devices have been thoroughly described. Amongst minor improvements to all models may be mentioned the very sensibly arranged pannier tool-bags, which are set below the carrier so as to facilitate access to the bags when a suitcase is on the carrier. A generator bracket is brazed to the centre of the handle-bars, large filler caps with glazed lids are provided, and the lubrication is by drip feed through a glass barrel. The Douglas machines have earned an enviable reputation for reliability in all the long distance trials, particularly in the A.C.U. Six Days' events.

Off-side of the new P.M.C. Motorette with water-cooled engine.

The new 6 h.p. twin Zenith-Gradua with Gradua variable gear.

Simple form of belt rim brake on the Puch.

Puch automatic stand. By pressing a pedal the stand flies out of action.

The open frame two-speed 2½ h.p. Douglas, which is suitable for the use of either sex.

Cylinder of a 4½ h.p. Quadrant, showing peculiar arrangement of exhaust valve at side and inlet valve at rear.

Valve side of the two-speed 2½ h.p. Tourist Douglas. The clutch pedal on the new model is fitted at the front of the left footboard.

The Olympia Show.—

CENTAUR, No. 123.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.v.; B. and B. carburetter; belt; Centaur two-speed hub gear.

THE CENTAUR CO., LTD., Stoke, Coventry.—This old-established firm has re-entered the motor cycle industry with a comprehensive range of models. The 3½ h.p. is a neatly finished machine with commendably large size tank, Druid spring forks, engine set *désaxé* with gear-driven magneto immediately behind the

sensible and neat dressguard over the belt is employed, and also an aluminium fender covering the whole of the top part of the cylinder.

ARNO, No. 61.

3½ h.p. MODEL: 84 × 89 mm.; side by side m.o.v.; Amac carburetter; belt; Sturmev-Archer three-speed gear fitted to order.

THE ARNO MOTOR CO., LTD., Gosford Street, Coventry.—The Arno de Luxe model is a particularly handsome machine finished in a colour which is known as

position afforded is very low, the height from the ground being only twenty-seven inches. The last-named features apply to all models. Two T.T. machines are also exhibited which resemble the above, except that they are fitted with dropped handle-bars.

Lightweight MODEL: 65 × 70 mm.; belt.

A particularly neat-looking machine, and, as it is equipped with good stand, inggage carrier, Druid spring forks, and other refinements, is a thoroughly practical lightweight. In all models the magneto is neatly carried behind the engine.

P. AND M., No. 70.

3½ h.p. MODEL: 82 × 88 mm.; side by side m.o.v.; P. and M. carburetter; chain; P. and M. two-speed counter-shaft.

PHILON AND MOORE, LTD., Tottenham Court Road, W.—Several interesting improvements have been incorporated in the new model. A front wheel stand is fitted just beneath the crank case, which when out of use springs automatically into position. Last week we described the new foot starting device, the carburetter (the lid of the float chamber of which is held in position by a spring, the sliding back of which allows it to be removed instantly), and the cover for the gearshaft, allowing oil to be squirted into the bearing. An important improvement in the engine is the provision of drilled cylindrical washers between the valve springs and the cylinder, which effectually keep the heat from the springs and allow them to retain their tension for a much longer period. The petrol filler is not provided with a vent hole, so that splashing is impossible, the vent being on a guide on the needle valve feed to the priming device, which pos-

P. & M. exhaust lifter and valve spring cage.

The new 3½ h.p. three-speed open-frame Centaur.

crank chamber, large dome-ended silencer with foot-operated cut-out, foot-operated rim brake, etc. The same model is made with a two-speed hub gear manufactured under Roc patents. This model has long indiarubber covered footboards, in front of which are the pedals for the two-speed gear and brakes. The engine can be started with a handle when the back wheel is on the ground.

3 h.p. MODEL (Twin): 60 × 60 mm.; side by side m.o.v.; B. and B. carburetter; belt.

The 3 h.p. model is a very well finished little twin in which the cylinders are also set *désaxé* on the crank chamber. Both exhaust pipes are brought to a large aluminium ended silencer which is placed immediately in front of the crank chamber, the rear exhaust pipe being swept round in a graceful curve. The rest of the specification is the same as for the larger single cylinder model.

2 h.p. MODEL: m.o.v. side by side; B. and B. carburetter; belt; Armstrong three-speed hub gear.

This model, which conforms to the same specification in general details as the above, is shown both with the fixed gear and variable hub gear, and both as a gentleman's and lady's mount. The latter is particularly well-designed, and should gain a large measure of popularity. The complication of small parts usually associated with ladies' models is done away with, and the gear makes it a mount capable of going anywhere. A

primrose. The attachment of the engine unit is worth studying, as the engine, magneto, carburetter, and silencer may be dropped clean away from the frame by undoing four bolts. The strengthening of the head and the design of the rear portion of the frame carrying the saddle also deserve inspection. Points of convenience are well studied. The oil pump is carried at the rear of the tank, close to the rider. Magneto handle-bar control and side wings to both rear and front mudguards are fitted. The saddle

The 1912 pattern 2½ h.p. lightweight Arno.

The Olympia Show.—

sesses a small groove to allow the air to reach the petrol. The rear brake is improved, and is worked by the rider's heel, the pedal operating the rod, which pulls directly on to the brake band. The front wheel is especially well protected by means of a very efficient mudguard. A variation of the above model is the

The 1912 3 1/2 h.p. P. & M. power plant, showing the enclosed chains from engine to countershaft, and gear inspection and lubrication hole.

colonial type, in which all the parts usually plated are black. A larger petrol tank is fitted; extra girders to the forks, heavier spokes and rims, and footrests placed in a higher position, so as to afford an ample ground clearance.

2 1/2 h.p. MODEL (Lightweight): 66 x 76 mm.; B. and B. carburetter; chain; P. and M. two-speed gear.

The well-known 2 1/2 h.p. model, which has acquitted itself so well since its introduction, remains practically unaltered except that the B. and B. carburetter is now fitted. The finish of the P. and M. machines is excellent throughout.

BAT, No. 63.

3 1/2 h.p. MODEL: 85 1/2 x 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt and chain; P. and M. two-speed gear.

THE BAT MOTOR MFG. CO., Kingswood Road, S.E.—The chief improvements in the Bat were described in our last issue. Among these we may mention the latest type of control and the P. and M. gear, while it must be recorded that the chief features in this and other Bat models are the insulating of the rider from road shocks by means of the well-known Bat spring seat and footrests, the

The Bat clutch operating lever.

neat method of carrying the magneto in a compartment of the tank, and driving the armature by means of a vertical shaft and bevel gearing.

Similar to the above is the standard model, which is single-gear. The T.T. model has a 3 1/2 h.p. J.A.P. engine, 90 x 77 1/2 mm., and other particulars as above. In this type of machine the magneto is carried in the front of the engine and is chain-driven. The frame is dropped at the rear, while a cylindrical tank and rigid forks are fitted.

The clutch mechanism on the 1912 Bats, shown detached and separated.

5-6 h.p. MODEL: 76 x 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt and chain; Bat two-speed gear and clutch.

The 5-6 h.p. and 7-8 h.p. twins are similar in detail. The latter model was fully described in our last issue, and is especially designed for sidecar work.

Showing alteration in spring frame and footboards on the twin Bat-Jap.

Particularly to be noticed in the chain-driven model is the improvement in the Bat spring frame.

As regards the twin T.T. machine, there are two types, the 5 h.p. and 8 h.p.

The Bat method of attaching gear box to slotted plate.

T.T. models, 85 x 65 and 90 x 77 1/2 mm.; inlet and exhaust overhead; B. and B. carburetter; belt drive. The firm are especially to be congratulated on the efficient manner in which their machines are displayed. Placed as they are on special stands, they may be inspected

with the greatest facility. Altogether the Bat exhibit is a most imposing one.

MOTO-REVE, No. 44.

3 h.p. MODEL: 53 x 77 mm.; overhead valves; Moto-Reve carburetter; belt; Villiers or Moto-Reve two-speed or Armstrong three-speed gear.

THE MOTO-REVE CO., LTD., Acton Vale, W.—The 3 h.p. Moto-Reve is quite a new model. It has two cylinders set at 60°. All valves are mechanically operated and disposed in the head, the tappets being adjustable. These valves are of particularly large diameter, having an area of over half that of the piston,

A cylinder of the 4 h.p. M.R. twin, showing design of overhead valve mechanism.

and so arranged that it is impossible for them to fall into the cylinders, unless the break should occur close to the head, which is rendered extremely unlikely, as a very large radius is employed from the stem. This model can be fitted either with fixed gear, Villiers two-speed, Armstrong three-speed, or a new two-speed Moto-Reve gear. This new gear lies in the hub, and consists of two pairs of pinions always in mesh operated by dog clutches. A separate clutch of the expanding metal band type is fitted at one side of the hub. The gear is particularly simple and small, and can be fitted to the existing models. The firm's own type Druid spring fork is employed without alteration, and the front mudguard is fitted with side flaps from the crown head downwards. A larger silencer is fitted on the 1912 mounts, having a hand-operated cut-out. Large diameter spring petrol and oil filler caps are used on the standard 3 h.p. The above description applies to the 4 h.p. model which made

The 3 h.p. twin-cylinder M.R. engine with overhead valves.

The Olympia Show.—

its debut in the Isle of Man races. This model, however, has an engine of 63 mm. bore and 80 mm. stroke.

2½ h.p. MODEL: 67 × 85 mm.; overhead valves; M.R. carburetter; belt; two or three-speed gear.

The 2½ h.p. is another new Moto-Rève model. It has a single-cylinder inclined engine, but in most other respects closely resembles the 3 h.p. model described above. As in the case of the 3 h.p. model, comfortable footrests are fitted, and the magneto is carried at an angle behind the cylinder instead of in front. The 2 h.p. model is a cheaper edition of the 2½ h.p. An automatic inlet valve lies above the exhaust valve, and the engine has a bore and stroke of 62 × 85 mm. In this case no footrests are fitted, and the magneto is handle-bar controlled. It is sold as a fixed gear model only. A point worthy of notice is that all Moto-Rève magnetos are manufactured by the company, and in every case except that of the 2 h.p. machine the armatures run on ball bearings. All brakes are provided with a simple form of adjustment.

TRUMP-J.A.P., No. 135.

3½ h.p. MODEL: 85.5 × 85 mm.; side by side m.o.i.v.; B. and B. (variable jet) carburetter; belt; Sturmev-Archer three-speed gear.

TRUMP MOTORS, LTD., John Bright Street, Birmingham.—The tank and filler caps on this machine should be specially noticed, the tank being riveted and very strong. The filler caps are 2in. diameter and hinged to prevent loss. The front forks are an adaptation of the Druid with rather shorter springs. The saddle position is very low without using a dropped top tube, the height from the ground with the rider's weight in the saddle being about 28in. The Albion clutch hub and fixed gear are also supplied. The steering head is made from one piece of metal, instead of having the lugs brazed to a tube in the ordinary style.

6 h.p. MODEL: 76 × 85 mm.; side by side m.o.i.v.; B. and B. (variable jet) carburetter; belt; Albion two-speed hub or free engine.

The twin cylinder is specially suitable for sidecar work, and is designed for that purpose. This machine has handle start-

ing. All the models have the new Bosch water-proof magneto, and are finished in grey, wheel rims plated and lined green, which gives them a very pleasing appearance.

3½ h.p. MODEL (racer): 90 × 77.5 mm.; side by side m.o.i.v.; C.A.P. carburetter; belt.

This machine follows the lines of that previously described, but has no mud-

supplied with this machine, while a specially strengthened lamp bracket is worth inspection.

2½ h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

This model is fitted with Druid spring forks. The engine is the well-known Precision. The magneto is carried in front, and is provided with a guard to

The new S.I.A.M.T. This mount, which is of Italian origin, can be supplied with Druid spring forks as shown.

guards or carrier. The forks are rigid, and the handle-bars, of course, differently shaped. The weight comes out at about 150 lbs.

TORPEDO, No. 67.

3½ h.p. MODEL: 86 × 86 mm.; m.o.i.v.; B. and B. carburetter; belt.

F. HOPPER AND CO., LTD., Barton-on-Humber.—One of these models is fitted with a two-speed gear and free engine in the rear hub, controlled by a pedal mounted on the footrest. In the case of this model the cylinders are held in place by swing bolts which considerably simplify their removal. The magneto is carried in front, and is protected by a guard. A practical type of spring fork, allowing a front brake to be fitted, is

protect it from wet. One of the 2½ h.p. machines shown is fitted with a free-engine clutch in the rear hub.

STUART, No. 62.

2½ h.p. MODEL (Two-stroke): 71 × 75½ mm.; Amac carburetter; belt drive.

NYE AND CO., Gray's Inn Road, W.C.—This interesting machine was fully described in a recent issue, and forms one of the most attractive features on Messrs. Nye's stand. The two-stroke engine unit merits the closest inspection, as it is full of interest. The Stuart engine unit is also shown separately.

S.I.A.M.T.

The successful little S.I.A.M.T. is one of the most interesting lightweights which is to be seen in the exhibition. Its engine (68 × 72 mm.) is a distinct departure from the standard. The whole of the various details were fully described and illustrated in a recent issue; therefore a brief mention of one or two of the more recent additions will suffice. In connection with the overhead valves, stops are provided to prevent a broken valve from falling through into the cylinder, while recesses are made in the cone joint formed by head and cylinder (in the cylinder itself), also with this intent. The top of the piston is hollow, and when the head is removed and the piston is at the top the resultant space is cup-shaped. It is easy, therefore, to clean off any carbon deposit which has formed without dismantling the engine. The exhaust port is of ample dimensions. All control wires terminate in loops or eyes, wider at one end than the other, and so arranged that it is only necessary to push forward the

2½ h.p. two-stroke Stuart from the belt side. This interesting mount was described in our issue of Nov. 9th.

The Olympia Show.—

control stud to allow it to slip through the wide end of the loop, when it is required to detach the wire. The lever

the carrier and mudguard with the object of facilitating tyre repairs. Stands are fitted to both wheels, and Druid forks are standard. Both the engines are manu-

and force pump combined, which allows the oil either to be sent direct to the engine or permits it to flow into the cylinder at whatever rate the rider desires. A multiple disc clutch is now

The winner of the Mont Cenis Hill-climb—the twin-cylinder S.I.A.M.T. in its racing form.

carrying the belt rim brake shoe is forked at its lower end, the stud on which it works passing through the lever, which is held in position by a spring, with the result that to loosen the wire, one has only to detach the brake and the wheel may be withdrawn—a matter of a minute. The machine in general has been greatly improved in detail since we last saw it, and now thoroughly conforms to English ideas. A square-sided tank, good stand and carrier, a comfortable saddle, and other refinements are fitted, while Druid forks may be had if desired.

P.V.-J.A.P.

3½ h.p. MODEL: 60 × 76 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

The most interesting part of this machine is the rear springing described in last week's issue of *The Motor Cycle*. The rear portion is also on view as a separate exhibit. The complete machine is fitted with J.A.P. automatic lubrication, Chater-Lea spring forks, and wide footboards, under one of which a tool box is carried. The petrol tank is of ample capacity. The springing of the rear frame should be carefully studied, and it will be noticed that the top tube is neatly sloped away at the back. In addition to the above a 3½ h.p. Triumph motor bicycle with Mabon variable pulley gear and a 6 h.p. Enfield sidecar are to be seen on Nye's stand.

EDLIN. No. 143.

2½ h.p. MODEL: 76 × 65 mm.; overhead m.o.i.v.; B. and B. carburetter; belt.

EDLIN SONS, LTD., Sherlock Street, Birmingham.—This engine is shown in a temporary frame. It is fitted with an easy starting device which relieves the compression by means of a cam and lever. It is brought into action by rotating the valve tappet, which has an extending piece fitted through an angle of 90°. A frame, without an engine, of a suitable size to take the 3½ h.p. 86.4 × 85 mm. engine shows the manner of turning back

factured by G. H. Illston and Son, 67, Bishop Street, Birmingham.

F.N., No. 126.

2½ h.p. MODEL: 65 × 75 mm.; side by side m.o.i.v.; F.N. carburetter; bevel gear; F.N. two-speed gear, sliding type.

THE F.N. MOTOR AGENCY, Great Portland Street, W.—This model, with multiple disc clutch, remains practically unaltered, with the exception that the mudguards have been strengthened and an improved type of carrier has been fitted.

5-6 h.p. MODEL (Four-cylinder): 52½ × 57 mm.; exhaust m.o., inlet a.o.; F.N. carburetter; bevel gear, two speeds.

With regard to the four-cylinder, several useful improvements have been introduced for 1912, among which we may mention a semi-automatic lubricator

Combined hand and drip feed oil pump on the 1912 F.N.

fitted to this machine, and the magneto is of the self-contained type (that is to say, the distributor is not carried separately). The distributor is a very neat piece of workmanship, and is so constructed that wet is absolutely excluded. The whole magneto is entirely

The single-cylinder F.N. power unit, showing engine cradle. The petrol filter has a glass top, weather and oil proof. Side shields are fitted to the front mudguards, and an improved type of luggage-carrier is now attached. The most striking machine among the four-cylinders is one enamelled in French grey, while yet

Valve side of the 1912 model four-cylinder F.N. with disc clutch.

The Olympia Show.—

another of these is fitted with a sidecar and the F.N. two-speed gear, which is manufactured especially for the F.N. Agency by the Western Motor Co. of Bath. Two examples of both the four and single-cylinder engines are shown in section, so that the splendid workmanship may be clearly seen.

REX, No. 73.

4 h.p. MODEL: $84\frac{1}{2} \times 95$ mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Rex two-speed gear; also with plate clutch and handle starting.

THE REX MOTOR MFG. CO., LTD., Earlsdon, Coventry.—The single-cylinder models have been re-designed for 1912, a

Showing the construction and springing of the 1912 Rex sidecar frame.

of the carrier. All the machines are fitted with the Rex spring cantilever saddle pin and the T.T. type of exhaust

worked by the rider's heel. The magneto is handle-bar controlled in all types. The inflator clips are brazed to the front forks.

6 h.p. MODEL: $75\frac{1}{2} \times 95$ mm.; side by side m.o.i.v.; B. and B. carburetter; Rex two-speed gear.

The principal features of the Rex twin, such as the tank, saddle, and efficient mudguards on the front wheel, wide rubber-covered footboards, etc., are the same as in the single-cylinder models. All touring machines are provided with a special bracket bolted to the head for carrying a generator. The T.T. twin is of the same dimensions as the above, but is single-gear and has a flat handlebar. One of the most interesting machines in the exhibition is the 4 h.p. water-cooled Rex. Except for the water cooling this machine is similar to the other single-cylinder model. The water-cooling system is particularly neatly carried out. Both outlet and inlet pipes are of ample dimensions, while the radiator is of the honeycomb type and should be particularly efficient. The circulation, of course, is on the thermo-syphon system. The water-cooled machine is fitted to a sidecar, the basket body of which calls for special comment. Its exterior lines are particularly graceful, and it is upholstered in Quaker grey-coloured leatherine. Pockets are provided on each side of the foot-

Arrangement of the water-cooling system on the 4 h.p. water-cooled Rex.

detailed description having already been published in these pages. The well-known two-speed hub gear remains unaltered. The starting handle is carried in a leather holster strapped to the side

Handle-starting device, consisting of a chain sprocket with clutch mounted on the right-hand back stay.

pipe, consisting of a long pipe extending to beyond the rear axle, the end of which is flattened. A cut-out is provided

The 1912 pattern 4 h.p. two-speed single-cylinder water-cooled Rex with sidecar.

The Rex sight drip-feed oiling system, also showing glass-topped filler cap.

board, while a high side door is fitted. The padding at the back is supplemented by springs, while upholstered rolls run along the side arms. The Sidette is also shown, the motive power of which is a 6 h.p. Rex twin engine. This machine is one of the most practical sidecar combinations in the exhibition.

The Olympia Show.—

SWIFT, No. 41.

3½ h.p. MODEL: 85 × 85 mm.; side by side; B. and B. carburetter; belt; variable gear by expanding pulley.

THE SWIFT CYCLE CO., LTD., Coventry.
A Swift motor cycle is exhibited for the

United Kingdom for the Moto-Rève engine which is fitted to this model. These engines have a patent spiral piston ring. A machine with this engine is claimed to do 53 miles an hour on the road. Further models are the 4 h.p. with Moto-Rève engine, twin-cylinders 63 × 80 mm., m.o.i.v. overhead type,

machine, while a semi-circular piece clips over the end of the mudguard, preventing mud from being thrown back. These flaps may be folded back out of use when not required from the front wheel. A well-made sidecar frame is shown with tubular luggage carrier underneath. It is fitted with lamp bracket and Chater-Lea spring wheel. A sidecar stand for home use is made of cast iron, and is provided with two legs on which a cross member of the sidecar frame rests. The A.J. sidecar stand is designed to be clipped

The new Swift 3½ h.p. bicycle, with spring saddle pillar.

first time for some years. It is on standard lines throughout with a straight top tube. The magneto is situated in front of the engine and is protected by mudflaps on the front wheel guards. A neat ratchet cut-out is fitted, and the variable gear is controlled by a lever on the handle-bar. The gear consists of an expanding pulley, the outer flange being forced by a spring to take up belt slackness. For starting purposes a decompressor is fitted, and is operated by a pedal on the right-hand side. A neat front wheel stand is employed. This model can also be supplied with an adjustable pulley and fixed engine. Both types are fitted with pedaling gear. The variable gear mount shown is fitted with an ingenious spring saddle pillar, which can be fitted at small extra cost. The decompressor is similar to that fitted on the Ariel machines, and consists of a secondary exhaust cam, brought into action by the pedal referred to above.

WULFRUNA, No. 59.

1½ h.p. MODEL: 63 × 66 mm.; side by side m.o.i.v.; Amac carburetter; belt drive.

THE WEARWELL CYCLE CO., Wolverhampton.—In this model the magneto is carried at the rear, out of the way of the elements. Druid spring forks are fitted and a good stand and luggage carrier, while it is, in fact, a thoroughly practical lightweight. Two other models are shown fitted with Stevens engine—2½ h.p. 76 × 82 mm. and 3½ h.p. 85 × 88 mm. These models in the main resemble the type first described.

2½ h.p. MODEL: 67 × 85 mm. Moto-Rève engine; side by side m.o.i.v.; M.R. carburetter; belt drive.

A speciality is made of this particular model, and it is interesting to note that the company are sole agents in the

M.R. carburetter, transmission by belt. This machine is fitted with the Millennium hub gear. It is interesting to record that the 4 h.p. M.R. engine recently secured a world's record in France, doing 105½ miles in two hours, and beating the previous record set up on a 9 h.p. twin René-Gillet.

E.L.I., No. 54.

THE E.L.I. MOTON MFG. CO., Station Road, Bristol.—Several interesting accessories, including the E.L.I. mud shields, the invention of Mr. Eli Clarke, specially designed to protect the front wheel. The side shield is made of metal and lined with leather, and is strapped over the front mudguard. Additional side flaps are provided for very bad weather, which lie at right angles to the

Chassis of Eli Clarke sidecar, showing extra tubes for carrying luggage, also form of springing.

on to the sidecar axle, when pressed down by the foot, and the sidecar pulled towards the rider, the combination is jacked up. There is no necessity to disturb the passenger. This is the invention of Mr. A. J. Sproston. There is also a new type of link motion spring fork, and a 3½ h.p. E.L.I. motor bicycle fitted with Precision engine. This machine has a B. and B. carburetter, belt transmission, and 2½ Dunlop tyres. The engine has mechanically operated side by side valves.

COMFY SIDECAR, No. 96.

J. WARD, High Road, Leytonstone, E.—Three types of Comfy sidecars are shown on this stand, all attached to Zenith-Gradua machines. The sidecar is sensibly designed. All tubes are telescopic and adjustable, and a folding stand is placed adjacent to the sidecar wheel, enabling the latter to be jacked up. The body is mounted on comfortable C springs, so far the most successful type.

ERIC SOCIABLE, No. 98.

6 h.p. MODEL (Twin-cylinder opposed): side by side m.o.i.v.; Longuemare carburetter.

THE P. AND C. SYNDICATE, LTD., 82, Amptill Road, Bedford.—Quite the most attractive exhibit on this stand is the

gine—consequently the largest fins surround the parts which most require cooling. There are springs underneath the tappets to keep them up to the valve stems, so as to avoid clatter. The piston head is dome shaped, having a minimum amount of obstruction. The fixing of the gudgeon has been improved by the addition of a locking bolt provided with a

pedal is depressed the shoe adapts itself to the rim. Side shields to the front mudguards are fitted in all cases. A similar model is also shown with a disc clutch in the rear hub.

2½ h.p. MODEL: 66 × 79 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; also with Armstrong three-speed gear.

This machine is fitted with Druid spring forks, and is in other respects similar to the model described above.

3½ h.p. MODEL (twin): 66 × 80 mm.; overhead m.o.i.v.; B. and B. carburetter; belt; Millennium two-speed hub.

This engine was shown for the first time last year, with special connecting rod arrangements causing both cylinders to fire evenly. The radiating fins are cast horizontally with the ground. This and all other Premier models have the magneto set neatly behind the engine. The two-speed gear is controlled by a pedal mounted on the footrest. In the

The Eric sociable—a car on three wheels.

Eric Sociable, quite a novel type of three-wheeled vehicle which follows car lines. In front is a dummy bonnet and radiator, the whole of the mechanism being carried at the rear. The engine is placed just behind the driver's seat, is set transversely across the frame, and is of the twin-cylinder opposed type. The valves are horizontal, and are on the upper side of the cylinders. Immediately above the crank case the magneto is carried. Aft of the engine is a leather-to-metal clutch, while behind it is a three-speed gear box. The drive is by cardan-shaft. The forward end of this shaft is provided with a double universal joint, while at its rearward end yet another universal joint is fitted. The final drive is by bevel. The steering is by wheel, and the change-speed lever is in a gate. Sight-feed lubricators are placed in view of the driver on the dashboard. The body is provided with a high side door, Cape cart hood and wind screen. The steering is by chain and cable, the former passing round a sprocket at the bottom of the steering-shaft, the cables going from the chains to the steering arms.

A 3½ h.p. Singer and a 3½ h.p. Zenith motor cycle are also shown on this stand.

PREMIER, No. 64.

3½ h.p. MODEL: 85 × 88 mm. side by side m.o.i.v.; B. and B. carburetter; belt; Millennium two-speed or Armstrong three-speed gear.

THE PREMIER CYCLE CO., LTD., Coventry.—The following are the chief Premier improvements for 1912. The diameter of the radiating fins decreases towards the lower portion of the cylinder, producing an appearance similar to the Gnome en-

Fastnut washer. The oil pump is fitted with a non-return valve. Druid instead of the Premier forks may be fitted if desired. Both tank stoppers are fitted with vents specially designed to prevent splashing. The rear mudguard is divided and held by a neat sort of clip and bolt, allowing the tyre to be exposed. These mudguards are specially wide in the case of the Millennium two-speed machine, so as to prevent mud being thrown on to the rider from the belt rims. On the single-cylinder models the brake is operated by one rod having a direct pull from the pedal lever. The brake shoe is pivoted on a stud fixed half-way up the arm which carries it, so that when the

Premier toolbag and number-plate combined in rear end of carrier.

case of this machine both silencers are separate one from the other. The excellent finish of these machines calls for special comment.

PILOT, No. 56.

THE PILOT CYCLE AND MOTOR CO., Soho Road, Birmingham.—The Pilot Cycle Co. are showing some examples of their sidecars with rigid frame and bodies of various patterns.

Latest T.T. roadster rpattern 3½ h.p. Premier.

The Olympia Show.—

FORWARD, No. 95.

2½ h.p. MODEL: 56 × 70 mm.; side by side m.o.i.v.; Amac carburetter; belt.

THE FORWARD CYCLE AND MOTOR CO., Edmund Street, Birmingham.—This is a

cable or a system of links and springs. The chief object of this idea is that if it becomes necessary to use pedals, the boards may be lifted up with the toe, and will remain in a vertical position until they are required. The Browning folding sidecar is also an item of interest. To detach the sidecar it is only necessary

machine can be wheeled through a door way like a motor bicycle.

N.S.U., No. 104.

6 h.p. MODEL: 75 × 90 mm.; overhead inlet valves; belt; two-speed gear.

THE N.S.U. MOTOR CO., LTD., Great Portland Street, W.—The frame, which has the top tube dropped at the rear, has a specially strengthened head which is made of a steel stamping. The engine is carried in a loop, as in all other N.S.U. 1912 models. The rear portion is sprung, which improvement was introduced at the last Olympia Show. The engine has the radiating fins cast horizontally with the ground. Overhead mechanical inlets are fitted, the tappet rods of which are adjustable, while the exhaust valve spring is provided with a special adjustable cap which allows the tension of the spring to be varied and facilitates the removal of the cotter and the valve itself. The N.S.U. two-speed gear is of the type described in a recent issue of *The Motor Cycle*, and has an adjustable pulley. Foot-rests are provided. A model similar to the above is strengthened where necessary, making it specially suitable for sidecar work. In the case of this machine the rear spring is enclosed; this casing serves to lock up the rear spring portion, as it is not possible to employ it when a sidecar is fitted. If the machine is desired to be used as a single the casing may be removed by undoing four bolts. One of the sidecars shown has a large cylindrical tank at the rear carrying an extra supply of petrol. The sidecar has a wide wing of the car type and new front for the footboard to protect the passenger's legs from draught.

3½ h.p. MODEL: 85 × 88 mm.; overhead m.o.i.v.; N.S.U. carburetter; belt.

This machine is particularly suitable for solo riding, and is thoroughly up-to-date in every respect. The top tube of the

1912 pattern 2½ h.p. twin-cylinder Forward, which has a loop frame.

particularly neat-looking lightweight, which follows standard lines throughout. We may mention that the magneto is handle-bar controlled, and the machine is well equipped, Druid spring forks, a good saddle, stand, luggage carrier, toolbag, and reflex light being fitted.

The mechanical features of the lady's model are the same as the above, but the chief point about the machine is the particularly neat way in which its working parts are enclosed. The petrol tank is carried in the top portion of the loop frame. The engine is entirely protected by a shield, the front and rear portions of which are open, and so designed that a strong draught of air impinges on the cylinders. The pedalling chain is carried in a gear case, and a proper skirt-guard is fitted over the rear wheel. This is one of the most neatly designed ladies' motor bicycles we have yet seen. Another gentleman's model shown is fitted with the Armstrong three-speed hub.

WIN-PRECISION, No. 16.

3½ h.p. MODEL: 85 × 88 mm.; side by side; B. and B. carburetter; belt; Villiers two-speed or Armstrong three-speed gear.

THE WINCYCLE TRADING CO., LTD., 106 and 107, Great Saffron Hill, London, E.C.—Two models of the Win-Precision motor cycle are shown—one of the fixed engine type, the other with two-speed and still a third, to which the Armstrong gear can be fitted at option. The frame and fittings are on standard lines throughout. A straight top tube is used, Druid forks, mud flaps on the front wheel, and a large shield is fitted over the Bosch magneto which lies in front of the engine. An ingenious foot-board is being shown which can be attached to the footrest quite simply. The rear end is suspended either by

to undo two locks under the foot of the sidecar body, and the latter with the springs still attached can be slid forward and lifted off, when it can be hung on the back of the machine or moved to a convenient spot. One of the front corners of the frame is then detached by loosening a spring clip attached to the front down tube of the cycle, and the front bar of the sidecar is then swung backwards and upwards on the rear bar until the sidecar frame has the appearance of

3 h.p. twin-cylinder N.S.U. with undergeared pulley. The bore and stroke are 58 × 75 mm.

a gate at right angles to the machine. The next movement swings the sidecar frame round on to a vertical pivot on the rear of the machine until it lies parallel against it. The wheel of the sidecar is then allowed to swing freely when it lies close and flat against the machine. When detached and folded the sidecar has a width of 7 in., so that the

frame is dropped at the rear and is sprung both fore and aft. The front forks have been slightly altered so that the clip of the spring under compression is used as a lamp bracket. The engine is provided with the same valve arrangements as on the twin just described, and as in all other cases the magneto is carried at the rear. The carburetter is the well-known N.S.U.

The Olympia Show.—

automatic type, which follows the lines of carburettors on motor cars.

3 h.p. MODEL (Twin): 58 × 75 mm.

This machine has the ordinary type of frame with straight top tube. The engine is fitted with the N.S.U. valve gear, which has been in use for many years and has proved its excellence, while an undergeared pulley is fitted.

2½ h.p. MODEL (Sidecar): 66 × 78 mm.; overhead i.v.; N.S.U. carburetter; belt.

The frame is of the ordinary type with straight top tube. The magneto in this, as in all other models, is neatly carried behind the engine. The inlet valve is the overhead mechanical type, and is arranged similarly to that of the 3 h.p. twin. The frame is sprung fore and aft. In all models where a two-speed gear is not fitted an adjustable pulley is provided. The large type of gear has an adjustable pulley incorporated with it, while the small type of gear remains as before. The N.S.U. two-speed gear may be fitted to all models. The machines are examples of the very best workmanship, design, and finish.

SINGER, No. 110.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

SINGER CYCLE CO., LTD., Coventry.—The standard single-gear machine has undergone very few important alterations, those which have been made, however, being excellent detail improvements in every way. The magneto is in front of the engine, and is gear driven, the timing gear case being very neatly arranged and containing quite the minimum number of pinions. The exhaust lifter is also enclosed in this case. The frame is slightly dropped, and the tank is somewhat altered in design, a special feature of this being the fact that clips on the top tube are absent, the base of the tank being secured to platforms brazed on to the second tube. Another excellent feature which applies to all models is the handle-

bar control, which is furnished with an arrangement which entirely prevents the levers altering their position through vibration. These levers are entirely of

the gears are thrown into operation by dog clutches, the pinion teeth being always in mesh. The belt is taken from a large pulley on the right-hand side of

The 2½ h.p. Singer stripped for racing.

metal, and are unusually long. This model is made with single gear, either with a Villiers clutch hub or as a T.T. machine with dropped handle-bars and rigid forks in place of the usual Druids. In the free engine model the operation of

the box. A 2½ h.p. model is made with the gear arranged in a similar way. This machine has a bore and stroke of 69 × 80 mm., and is practically a reduced facsimile of the 3½ h.p., except that in the attachment of the tank the platforms are not brazed in position but are clipped. The 2½ h.p. machine is made either single-gear with a Villiers free engine hub only or with the Singer two-speed gear.

A late arrival on this stand was the new lady's model, which was fitted with a 2½ h.p. engine placed vertically in the frame, the magneto being in front of the cylinder as in usual Singer practice. The machine is of very neat design, and has a very efficient guard over the belt to protect the rider's dress. A Villiers clutch is fitted in the rear hub. The Singer range is very enticing.

L.M.C., No. 81.

4 h.p. MODEL: 89 × 92 mm.; side by side; B. and B. or Amac carburetter; belt; Roc two-speed gear.

THE LLOYD MOTOR ENG. CO., LTD., Monument Road, Birmingham.—This machine was described in a recent issue, and needs no more than a general description here. It is constructed throughout to withstand the strains of sidecar work, and has a very workmanlike appearance. The two-speed gear and

The combined valve cover and trouser guard on the 2½ and 3½ Singers.

the clutch is carried out very neatly, while an excellent point is the fact that the belt rim spokes are reinforced with plates where they join the rim itself, thus making an extremely strong and rigid job. The silencer is fitted with a foot-operated cut-out.

4 h.p. MODEL: 88 × 88 mm.; side by side m.o.; B. and B. carburetter; gear and belt; two-speed Singer counter-shaft.

The 4 h.p. model is intended more especially for sidecar work, and as a full description of it has recently appeared in *The Motor Cycle*, it is unnecessary here to do more than touch upon its salient features. The general specification is the same as that of the 3½ h.p. model, except, of course, that the casting of the crank chamber is extended to enclose the counter-shaft gear box in which

New pattern 2½ h.p. Singer, showing two-speed counter-shaft gear.

The L.M.C. pedal-operated exhaust valve-lifter

The Olympia Show.—

both brakes are operated by pedals placed on the long rubber-covered footboards. The spring forks have been re-designed, so that it is now a simple matter to withdraw the front wheel. The frame is on standard lines, but the tank has cut-away sides at the rear so as to avoid rubbing the legs. Mud-guarding is carefully carried out, with side flaps fitted to the front guard.

3½ h.p. MODEL: 85 × 88 mm.; side by side; B. and B. or Amac carburetter; belt; Auto-Varia gear.

This machine has undergone very few alterations for next year. As in the case of the 4 h.p., the spring forks have been improved. The Auto-Varia gear is too well known to need description. The silencer has been re-designed, and is fitted with an end plate to prevent

Plan of 4 h.p. "Sidecar" L.M.C., showing footboards and gear control pedals.

the exhaust gases impinging on the rider's foot or leg. This engine is also fitted to the Tourist Trophy type, and can be supplied either with fixed engine or a Roc type gear. In the case of the Tourist Trophy type, the footrests have been dropped to give a more comfortable riding position. A neat pedal-operated exhaust lift, as well as the usual hand control, is fitted to one of these machines, and the L.M.C. universally-jointed connecting rod used throughout. Other details will be found in a recent issue. Handle-bar magneto control is fitted as standard.

SERVICE, No. 129.

8 h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; B. and B. variable jet carburetter; service belt; Roc hub two-speed gear.

THE SERVICE CO., High Holborn, W.C.
—This is one of the new models made by the Service Co. fitted with a J.A.P.

Details of the new foot starting apparatus mounted on the side of the gear box of the 1912 Douglas, also showing the toe and heel clutch operating pedal.

engine and Druid forks. The frame is on standard lines with top tube dropped at the rear. The arrangement of the exhaust pipes is distinctly neat. The finish is in grey, with blue panels on the tank. This model is suitable for sidecar or Colonial use. Two pannier toolbags are provided and a starting handle.

AUTOTRIX, No. 134.

4 h.p. MODEL: 85.5 × 85 mm.; side by side m.o.i.v.; Amac carburetter; two belts; variable pulleys on counter-shaft.

EDMONDS AND WADDEN, The Quadrant, Weybridge.—This sociable tricar has a light cane body upholstered in red. The engine—a J.A.P.—is placed in front immediately below the petrol tank, which is carried on a special bracket. The frame is light and simple in construction and the weight is about 280 lbs. A 650 × 65 mm. tyre is fitted to the back wheel. The front wheels are shod with 26 × 2¼ tyres.

3 h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; Amac carburetter; chain; two-speed dog clutch on counter-shaft.

A more powerful tricar has a coach-built body. The J.A.P. engine is carried under the seat and fitted with a clutch on the crankshaft. The back wheel has a 700 × 80 mm. steel-studded tyre, the front wheels having 26 × 2½ motor cycle tyres. Platforms are provided at

the rear, on which luggage can be carried. Both machines have wheel steering; this is direct at present, but indirect steering will be fitted to the more powerful model. The engines are air-cooled.

3½ h.p. MODEL: 85.5 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Villiers free engine hub.

Two models of the Brooklands are shown, one a roadster on standard lines with the magneto placed in front of the engine, handle-bar control, Druid forks, drop top tube, and pannier toolbags. The racing model has rigid forks and no mudguards. The ignition is by coil.

ELSWICK, No. 102.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Eadie free engine.

ELSWICK CYCLES AND MFG. CO., Barton-on-Humber.—This machine follows standard lines throughout, having the usual type of frame with top tube dropped at the rear, Druid spring forks, Eadie free engine hub, Best and Lloyd lubricator, and Davison hinged filler caps are fitted.

2½ h.p. MODEL: 70 × 76 mm.; B. and B. carburetter; belt

The smaller machine is similar in most respects to the above as regards detail, except that the ordinary type of frame is employed. It is turned out ready for the road, fitted with covered magneto, luggage carrier, number plates, etc.

Autotrix sociable propelled by an 8 h.p. twin Jap engine through a three-speed gear.

The Olympia Show.—

JAMES, No. 69.

3½ h.p. MODEL: 86 × 96 mm.; side by side m.o.i.v.; B. and B. carburetter; chain; two-speed on counter-shaft.

JAMES CYCLE Co., Greet, Birmingham.—A two-speed chain-driven machine was among the late arrivals at the Show. It is fitted to a Canoelet sidecar, the whole turnout being very attractive. The foot starter is returned to its place by a spring; it can also be used as a footrest. The leather-to-metal clutch is controlled from the left handle-bar. The sidecar clips are brazed to the frame. The magneto is controlled by a lever on the tank, and is placed behind the

Countershaft gear and foot-starter on the 1912 James, one of the neatest units in the Show. The gear lever is now affixed to the tank tube as shown.

engine. The two-speed lever is carried on a lug brazed to the frame. The tyres are 2¼ in. studded, and the forks Druid pattern with curved lower links. A Lycett pan seat is fitted, and the front mudguard has side flaps. Other models shown have belt drive and fixed gear. They can also be fitted with two and three-speed gears, the latter either Armstrong or Sturmer-Archer.

CANOELET, No. 190.

MEAD AND DEAKIN, Sparkbrook, Birmingham.—The Canoelet sidecar, which we illustrated and described in our issue of the 9th inst., is to be seen on this stand. Three examples are shown, one attached to a Humber two-speed motor cycle, and a commercial body attached

The new Canoelet sidecar, showing the original method of suspending the body on leaf springs.

to a 5-6 h.p. Clyno. This body has no less than three separate partitions for carrying goods, as well as a place in the rear for petrol and oil. Thus the petrol is kept separate from any goods that may be carried. This body is interchangeable with the pleasure body, the chassis being the same in each case.

HUMBER, No. 40.

3½ h.p. MODEL: 84 × 90 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Humber two-speed gear.

HUMBER, LTD., Coventry and London.

—The 3½ h.p. Humber engine has been re-designed for 1912 and now carries the magneto in a more convenient position behind the engine; the armature is driven by a train of gears. The frame has a dropped top tube, special type Druid forks and front wheel stand, and is fitted with rubber-covered footrests, from which the gear pedals are operated. The rearward portion of the back mudguard is hinged to facilitate tyre repairs, and the front guard is formed with side flaps extending slightly forward of the forks. The main portion of the petrol tank is formed from one piece of metal, and has a cylindrical oil tank let into it. The valves are operated by adjustable tappets. A half-compression device for easy starting is operated by a lever on the left handle-bar. This machine can be supplied with fixed gear and pedals or a free engine. Further descriptions of this model have appeared in our recent issues.

2½ (twin) and 2 h.p. (single) MODELS: 60 × 60 mm. and 60 × 70 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed on both.

The engine of the 2½ h.p. model is identical with the winner of this year's Junior Tourist Trophy Race. It will

Dress-guard on the ladies' Humber.

be remembered that the cylinders are offset, and this feature applies to all Humber models. The position of mudguards, forks, frame, tank and magneto is similar to the 3½ h.p. model but on a lighter scale. A single silencer is fitted to the front of the engine and has a foot-operated cut-out on the left-hand side. This model can be supplied with free engine, Armstrong three-speed, or fixed gear. Pedals or double footrests can be fitted to any of these types at option.

The 2 h.p. single-cylinder lightweight remains exactly the same as before. A 2 h.p. lady's model is also shown, but this has only undergone slight alteration since it was last described in our pages.

The Humber Co. are exhibiting a railway inspection trolley fitted with a 2 h.p. engine and driven direct by a single

chain. We hear this is for a special Argentine order. The company are also showing the actual mount on which P. J. Evans won the Junior Tourist Trophy Race and on which Sam Wright recently broke the Twin-cylinder Lightweight Hour Record.

QUADRANT, Nos. 93 and 94.

3½ h.p. MODEL: 85 × 88 mm.; inlet at rear and exhaust at side m.o.i.v.; B. and B. carburetter; belt.

"QUADRANT," Lawley Street, Birmingham.—The Quadrant engine is a distinct departure from the standard. The exhaust valve is at the side and the ex-

Method of balancing the Quadrant engine. The practice of cutting away the flywheel web, as shown, is gaining favour.

haust chamber is surrounded by deep radiating fins. The inlet valve is at the rear and without fins, the sparking plug being inserted above the inlet valve. The magneto is neatly placed behind the engine, well out of the way of the elements. A further feature of the engine is the clean and smooth exterior of the crank case. A small bore pipe conveys oil spray from the crank case to the combustion chamber. The down tube of the frame is gracefully curved, and the top tube is dropped away at the rear. The foot brake pedal is carried on a separate stud. Handle-bar control is provided to the magneto. One model is shown provided with the Armstrong three-speed gear, while on all types the design of the lamp bracket is worth inspection.

2 h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; B. and B. carburetter; Villiers free engine hub.

This is a particularly neat-looking machine, with gear-driven magneto placed behind the engine. Like most of the other models, it is finished in French grey, and is of a particularly pleasing appearance. Side shields are fitted to both rear and front mudguards. A separate belt rim is provided for the rear brake.

4 h.p. MODEL: 87 × 88 mm.

A 4 h.p. model is shown fitted with an Armstrong three-speed gear, wide petrol tanks, comfortable pan seat, and is a sensible touring mount of attractive appearance and excellent design. This machine is enamelled in black. A T.T. model is also shown.

The latest two-speed James with Canoelet sidecar, one of the most attractive passenger models in the Show.

The Olympia Show.—

TRIUMPH, No. 119.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; Triumph carburetter; belt.

TRIUMPH CYCLE CO., LTD., Coventry.—Motor cyclists have the choice of four different model Triumphs, each with the same power unit. These are (1) the free engine model, (2) the standard pattern with pedals, (3) the T.T. roadster with touring equipment, and (4) the T.T. racer.

Triumph adjustable spring tappet, shown dissected. In the new design the springs are enclosed.

The 1912 improvements, which are minor in character, have been already dealt with, but we may summarise the departures for next year. Amongst them may be cited the rounded top edge of the tank, which certainly makes a more enhanced appearance and cannot fail to give greater comfort for high speed touring; the spring fork, which is neater and undoubtedly a more efficient shock absorber; adjustable spring tappets; needle valves instead of petrol taps; new front brake; adjustable footrests, enabling a lower position for the foot. The sides of the belt pulley have a ring of round holes which considerably minimise the possibility of belt slip, especially in wet weather. The most novel feature is the new type of magneto advance, which is operated by a small pedal on

an extension of the left footrest, the connection requiring only a short rod. This distinctly original fitment seems to attract the show visitor more than anything else, and many are the discussions one hears as to its probable utility on lumpy road surfaces. The Triumphs, as usual, are among the best finished machines in the show, a veritable mass of glitter which seems to draw visitors like a magnet. Harry Long is there with his "40,000 miles in ten months" Triumph, and enjoys a chat with riders he met during his long travels.

HOBART, No. 105.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

HOBART BIRD AND CO., LTD., Coventry.—The 3½ h.p. Hobart is a neatly-designed machine on standard lines with a dropped frame. It is fitted with Druid spring forks and Eisemann magneto, the latter being placed immediately in front of the engine, where it is driven by chain. Lubrication of the engine is of the automatic type, and consists of a Benton and Stone sight-feed drip lubricator, through which oil is drawn by the vacuum in the crank chamber. A Villiers clutch hub is fitted as standard to this model.

2½ h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

The 2½ h.p. Handy Hobart is a neat little machine on much the same lines

Hobart method of dividing clutch rod.

as the 3½ h.p., of which it is practically a reduced *facsimile*, except that it is fitted with a Best and Lloyd drip-feed lubricator worked by a spring plunger

pump. The saddle position is very low, and altogether the aspect of the machine is very neat and practical. It is supplied also with a fixed gear. Although rated at the same power, the ladies' Hobart has a different engine, which is 2 mm longer in the stroke and is placed in an inclined position. The requirements of ladies have been very well studied on this machine, as all the moving parts are covered in by easily-

The Triumph power unit showing adjustable spring tappets.

detachable shields, which are secured in position by wing nuts. The saddle position is low, and a good point which ladies will appreciate is the fact that the width between the centres of the footrests is unusually narrow. This machine is fitted with an automatic Benton and Stone sight-feed lubricator. The three-speed Armstrong hub is operated by a lever at the side of the inclined petrol and oil tank, immediately behind the steering head. A new model for 1912 is a 4½ h.p. twin, the bore and stroke of which are 68 × 76 mm.; this is essentially designed to be a sidecar machine, and is fitted with the Millennium two-speed and free-engine clutch hub. A Best and Lloyd lubricator is used, otherwise the specification of the machine is the same as that of the 3½ h.p.

CALCOTT, No. 80.

2½ h.p. MODEL: 63 × 76 mm.; m.o.i.v.; B. and B. carburetter; belt.

CALCOTT BROS., LTD., Coventry.—This neat-looking little machine follows standard lines throughout, and it is interesting to note that the engine is manufactured by Messrs. Calcott Bros. at their own works. The magneto is carried behind the cylinder, and a simple and ingenious form of internal exhaust valve lifter is fitted. The spring forks are the well-known Druid. It is also

The 1912 3½ h.p. Tourist Trophy Triumph.

The Olympia Show.—

of interest to note that in this engine the firing point of the magneto is fixed. A spacious toolbag, which is flat, so that a bag can be strapped on it, is fixed to the luggage carrier.

WALL, No. 111.

4½ h.p. MODEL: 85 × 96 mm.; side by side m.o.i.v.; B. and B. carburetter; gear; two-speed Roc.

A. W. WALL, LTD., Hay Mills, Birmingham.—This firm may always be counted upon to provide something original. They now stage an improved form of sociable-seated tricycle. This has a very strong tubular frame, which is taken up in front to support the 4½ h.p. Precision engine. From the crank case of this is supported a casing in which is carried a bevel gear and also the pinion for the starting handle, the latter being geared

folded engine of the Wall commercial type tricycle.

up in relation to the crankshaft. In contradistinction to the usual run of sociable tricycles, the Wall machine has one wheel in front and two driving wheels behind, these being carried on a neatly designed car type back axle fitted with a small differential gear, the final drive being by bevel pinion. The propeller-shaft has a universal joint at each end and is neatly encased. The body, which is most roomy and comfortable, is supported on long flat Cee springs. The machine is fitted with ball bearings throughout. On the same stand are

shown a number of the well-known Roc gears, which are already in use on so many machines in the Show. This gear works on the epicyclic principle and employs a pair of friction bands for the operation of the two gears.

SCOTT, No. 125.

3½ b.p. MODEL: 2½ × 2½ in., two-stroke; Scott automatic carburetter; chain; two-speed Scott counter-shaft gear.

THE SCOTT ENGINEERING CO., LTD., Mornington Works, Bradford.—As the Scott 1912 improvements were very completely dealt with in our last issue, it is unnecessary to do more than touch upon the more salient points. The first of these is the re-designing of the engine, making the cylinders and crank chamber much neater. A very ingenious device has been introduced for allowing the quick detachability of the cylinders, it being only necessary now to slack off the four security bolts and withdraw four pins, when the cylinders come away clear. The bore of the engine has been slightly increased. The two-speed counter-shaft gear has been improved in detail, and is now furnished throughout with ball bearings, even the wedge bar operating the clutches being also fitted with roller thrust blocks. The mudguarding on this machine leaves little to be desired. The side flaps on the front guard are utilised as number plates. This part of the guard is also detachable to allow the front tyre to be easily got at. The carburetter has been refined in several details, the springs for the return of the air and throttle valves being now housed in tubular brass cases.

Clever method of securing the Scott cylinders to the crank case. (See page 1220 last week.)

A cylinder.
B crank case.
C Bolt. D Pin.

The standard colour of Scott machines is a very pleasing shade of purple, and

Scott detachable front number plate, shown upside down in the lower sketch. The upper one shows the spring mudguard stay and tongue of the fixed guard.

it need hardly be said that they represent some of the finest workmanship to be seen at Olympia. It will be difficult to get a Scott next year, judging by the order list we have seen.

ALCYON, No. 85.

2 h.p. MODEL: 47 × 72 mm. twin and 62 × 82 mm. single; fore and aft m.o.i.v.; Alcyon-Claudet carburetter; twin-cylinder, gear and chain; single-cylinder, belt.

G. N. HIGGS, Vauxhall Bridge Road, S.W.—The twin-cylinder model is quite an interesting mount. The cylinders are placed vertically side by side, the exhaust valve facing forward to enable it to receive the full benefit of the cooling draught. The two cylinders are connected by one branch exhaust pipe which leads into the main exhaust pipe. On the near side, and cast with part of the crank case, is the gear case containing the gear drive to the counter-shaft. On the counter-shaft inside the gear case there is a plate clutch put into operation by a lever on the top tube. By lifting a ratchet on the chain sprocket the pedals are connected to the engine, so that they may be used to start with the back wheel on the ground. By putting the ratchet into engagement the pedals and the rear wheel are connected by means of the chain, so that the pedals may be used for assisting the engine if necessary. The timing gear is on the off side. The finish of the engine is particularly good. Bowden actuated rim brakes are fitted, but in the near future a belt rim brake will be used. The machine is made to conform absolutely to English ideas, and is fitted with tapless oil pump, a capacious tank, carrier, tool bag, Alcyon spring forks, and Hutchinson tyres. The single cylinder machine is similar in most respects to the twin. The foot-rests fitted to both models are so arranged that the portion on which the rider's foot is placed can be folded away if not required. The 1912 Alcyons have not been placed on the market until they have been thoroughly proved, and the whole of 1911 has been devoted to this purpose. The recent track performances of this make of machine in the hands of Mr. N. D. Slatter fully justify the efforts Mr. Higgs has made towards its perfection.

1912 model two-stroke Scott, the improvements in which were detailed in our last issue.

The Olympia Show.—

CORAH, No. 132.

3½ h.p. MODEL (Tourist): 85.5 × 85 mm.; side by side m.o.v.; Binks carburetter; belt; Albion two-speed hub.

THE CORAH MOTOR MFG. CO., King's Norton.—This machine is fitted with Corah patent forks. The magneto is placed on a bracket in front of the engine, protected by an aluminium guard. The carrier is easily detachable to facilitate the mending of punctures. The Albion free-engine clutch or fixed gear can be had as desired. The handle-bars are quite novel, the Bowden wires being partly inside, and adjustment being provided for them at two points.

3½ h.p. MODEL (T.T. Racer): 90 × 77.5 mm.; overhead valves; C.A.P. carburetter; belt.

This model can also be had with the same engine as is fitted to the tourist machine. Aluminium footrests with rubber studs are provided. There being no carrier, the toolbag is placed over

The Turner sidecar. It is being exhibited on the Corah stand.

the tank, and knee grips are fitted. All models have both front and rear stands, and reflex lights are fitted as a standard. The firm is also showing a sidecar with a Turner body on a Corah chassis. There are C springs both in front and rear, and the body is fitted with hood and

The Turner coach-built sidecar with folding top, door, hood, and screen.

screen. This body is illustrated on this page.

4½ h.p. MODEL (Sidecar): 80 × 93 mm.; side by side m.o.v.; Albion two-speed hub.

This machine, designed for sidecar work, is to be seen outside the Show, and is used for demonstration purposes. The general lines are as already described.

HAZLEWOOD, No. 43.

2½ h.p. MODEL: 70 × 76 mm.; side by side; B. and B. carburetter; belt; Armstrong three-speed gear.

HAZLEWOODS, LTD., West Orchard, Coventry.—This machine is quite a new departure for the Hazlewood Co. It is fitted with a 2½ h.p. J.A.P. engine. The machine is on standard lines throughout, having a dropped top tube, Druid spring forks, kick up stand and strong carrier. Great attention has been paid to the brake gear, which is very strongly carried out, the rear foot brake rod being fitted with a support, which is also used as a stop for the spring pushing the shoe out of action. The magneto is situated high up behind the engine, and is consequently well protected from mud. This machine can be supplied with a fixed gear and adjustable pulley. Both models are fitted with pedal gear.

ALLDAYS AND ONIONS, No. 38.

3½ h.p. MODEL: 85 × 88 mm.; side by side; B. and B. carburetter; belt; Roc two-speed gear.

ALLDAYS AND ONIONS PNEUMATIC ENG. CO., LTD., Matchless Works, Birmingham.—The Alldays machine, which was described in a recent issue, has several minor improvements compared with the 1911 model. A drop top tube is employed, aluminium footboards are sprung from the front end, and the magneto is carried behind the engine well out of the mud and dirt. A good feature of these machines is the simple detachment of the front brakes, rendering the front wheel very easy to remove. The model shown to us

The Alldays' sight-feel adjustable oiler and hand-pressure pump.

is fitted with a new Middlemore back rest. This machine can also be supplied either with free engine or fixed gear and pedals.

B.S.A., No. 122.

3½ b.p. MODEL: 85 × 88 mm.; side by side m.o.v.; B. and B. carburetter; belt transmission; B.S.A. two-speed gear.

BIRMINGHAM SMALL ARMS CO., LTD., Birmingham.—The B.S.A. machines on view at the Show exhibit a few notable differences from those which have proved so successful during the last year, the only new introduction being a two-speed gear model with B.S.A. hub clutch. This device was recently illustrated and described in *The Motor Cycle*, and it need only now be said that it is of the epicyclic type, having a low gear with a forty per cent. reduction in ratio below the high. The clutch is entirely enclosed, and is of the

The B.S.A. front hub. By unslackening the left-hand nut and taking out the bolt, the wheel is free to slide out.

metal-to-metal cone type. A good point in this gear is that only one kind of lubricant is required for the whole of the bearings. The magneto bracket is cast in one with the aluminium silencer end plates, but the aluminium magneto cover has been dispensed with, as a totally enclosed Bosch machine is used. The cut-

Corah T.T. model with overhead valve J.A.P. engine.

The Olympia Show.

out on the silencer is operated by a rocking pedal. B.S.A. spring forks are the

mounted on the crank case casting. After entering the interior of the crank case the gas is transferred *via* a horizontal pipe to

swinging the driving pulley radially on a gear wheel driven from the main shaft. The petrol tank is of the streamline type (see illustrations), whilst still another novel feature is the system of springing both the front and rear of the frame. The axles are fitted between strong spiral springs, which latter are enclosed in vertical casings. The Wooler is, in short, the novelty of the Show, and well worthy of careful scrutiny. The finish calls for admiration.

BROWN, No. 207.

3½ h.p. MODEL: 86 × 86 mm.; side by side m.o.v.; B. and B. carburetter; belt; three-speed gear, optional.

BROWN BROS., LTD., Great Eastern Street, E.C.—This year the firm is displaying some fine examples of the standard lightweight and a 3½ h.p. machine fitted with Armstrong three-speed gear and sidecar; also a sidecar combination of the same power with Bowden two-speed gear. The 3½ h.p. in essentials remains the same as last year, but numerous improvements have been embodied. For instance, in the Brown design of spring forks the sliding sleeve underneath the helical spring has been lengthened, so as to give greater surface and minimise the risk of grit working in.

T.T. model B.S.A.—an entirely new mount.

same in general design as those of last year, but now have a generator bracket brazed on to the side of the blade. The hand brake and exhaust lifter are worked by inverted levers with enclosed Bowden cables. The handle-bar grips are furnished with helical grooves which are extremely comfortable and firm. The frame is of the dropped type. The lubrication of the engine is by a Best and Lloyd sight-feed drip lubricator, and the oil is forced through an adjustable nozzle by a spring behind the plunger.

WOOLER, No. 62.

This machine possesses probably the most novel departures from standard practice, and it is sure to draw an interested crowd to Messrs. Nye and Co.'s stand No. 62. Unfortunately the machine is exhibited in an incomplete state. Power is derived from a horizontal two-stroke single-cylinder engine, which in itself is of entirely original design. An Amac carburetter is fitted at the rear of the crank case, the induction pipe being swept over the magneto, which latter is

the combustion chamber, being admitted by an automatic inlet valve of orthodox design. A variable pulley gear is fitted

THE WOOLER TWO-STROKE SPRING FRAME MACHINE, THE GREATEST NOVELTY IN THE SHOW.

(1) Arrangement of horizontal engine and gear.

(2) Streamline petrol tank, also showing system of spring frame.

operated by pedals protruding through the footboards, and the slackness of the belt on the low gears is taken up by

Where possible cap nuts have been fitted so that grit cannot work into the threads. The cylinder dimensions of this design bring it within the 500 c.c. class. The engine, magneto and carburetter are self-contained, so that by removing three bolts the engine can be dropped out of the frame for overhauling. The magneto is in front, protected by a steel cover, in addition to the large leather flap on the front mudguard. The design of rim brake is so arranged that the shoe is applied at once for its full length on the inside of the rim.

2½ h.p. MODEL: 70 × 76 mm.; side by side m.o.v.; B. and B. carburetter; belt.

The lightweight machines are of very taking design, fitted with a small Precision engine. An improvement this year lies in the adjustable pulley now fitted to the engine. Druid type front forks, made under licence, are fitted, and the machine, which is very substantial, scales about 100 lbs. Magneto protection and other details are the same as in the larger model, and include a petrol filter in the tank. The two varieties of sidecar fitted are the Millford and the Duco.

Clear side of the Wooler two-stroke spring frame machine.

The Olympia Show.—

ARIEL, No. 124.

3½ h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Ariel expanding pulley or Armstrong hub gears.

COMPONENTS. LTD. (Ariel Dept.), Bournbrook, Birmingham.—The improvements in this year's 3½ h.p. model relate only to details. Amongst the most notable of these is the re-arrangement of the half compression device, which is now operated by a rocking pedal on the right footboard, instead of, as previously, by the valve lifter lever. The internal design of the decompressor has been considerably modified, and now consists of two cams, which are brought into action by interconnected tappet rockers. The action is entirely positive. There is nothing to go wrong, and any number of intermediate positions can be obtained between full compression and the limit of low compression at which the engine will fire. A front wheel stand is fitted pivoted to special lugs on the forks. The standard carrier has been simplified and improved, and is now provided with a clip which allows the ready detachment of the rear mudguard. The 3½ h.p.

The toe and heel pedal on the right side of the 1912 Ariel operating the decompressor.

model is also supplied with a three-speed Armstrong hub gear. These machines can be fitted to order with a detachable tank and middle rail, the tank being supported by a long bracket plate running from end to end of the tube.

2½ h.p. MODEL: 71 × 75 mm.; m.o.i.v. side by side; B. and B. carburetter; belt; Ariel adjustable pulley and chain speed gear.

This neat little machine is practically a reduced facsimile of the 3½ h.p., and is very neatly designed indeed. It has Druid spring forks, chain-driven Bosch magneto which is in front of the engine, large side extensions to the front mudguard, and pannier toolbags. This model is also shown with a fixed gear.

MACBETH, No. 101.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Roc.

COLMORE DEPOT, Colmore Row, Birmingham.—This is a most sensibly designed machine. The top tube is dropped at the rear. A Benton and Stone adjustable drip-feed lubricator, working by suction from the crank case, is provided. The two-speed gear is the well-known Roc. A cut-out, worked by a rocking pedal, is a particularly neat fitment, and there are comfortable footboards.

The toe and heel pedal operating the Macbeth cut-out.

The luggage carrier is exceedingly strong and well designed, and pannier toolbags are fitted. The spring forks are the well-known Druid. A similar model is also shown with fixed gear, and the magneto advance handle-bar controlled. The magneto is the new type of enclosed Bosch and is placed behind the engine. We may mention that the Precision engine may be had if desired instead of the above, which is the firm's own. In addition the Colmore Depot show the following: A 2½ h.p. Douglas, 3½ h.p. Zenith, 3½ h.p. New Hudson, 3½ h.p. Premier with Armstrong gear, and two sidecars. Also 7-8 h.p. three-speed chain-driven Chater-Lea with sidecar, and a 6 h.p. Matchless with sidecar.

ROVER, No. 113.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

THE ROVER CO., LTD., Meteor Works, Coventry.—The 3½ h.p. Rover is much the same as last year, but the 1912 model possesses a number of minor improvements. Amongst these may be mentioned the shortened frame, the new stand, exhaust cut-out, new pattern Druid front forks with extra large springs, U shape of up-turned handle-bar with brazed on control lugs, and internal Bowden cables. The engine lugs have been very much strengthened, and the machine has been certainly improved by the fitting of a front stand. The Bosch entirely closed magneto is carried immediately at the rear of the cylinder, and is well protected from mud and wet. The magneto is controlled from the handle-bar. Two variations in this model are made, namely, the free engine type with Triumph free engine clutch in the rear wheel, and single gear type with direct belt drive. In all patterns large toolbags are fitted to the carrier, and the rear brake, which acts on a belt rim, is considerably strengthened. In the engine the valve gear has been provided with bigger wearing surfaces, and the magneto is now driven by a silent chain which obviates the likelihood of backlash developing through stretch.

NEW HUDSON, No. 75.

3½ h.p. COLONIAL MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; Armstrong three-speed gear.

THE NEW HUDSON CYCLE CO., LTD., Summerhill Works, Birmingham.—The most interesting model on this stand is the Colonial machine fitted with a petrol tank to hold two gallons. It is shown fitted to a Montgomery sidecar. The

combination, finished in French grey, is a particularly attractive one. The new type of New Hudson engine and a number of interesting detail improvements are incorporated in this model, e.g., there are as few movable clips as possible on the machine. Whenever a bracket or a fulcrum has to be attached it is fastened to a lug brazed on the machine. The luggage carrier is riveted on to the mudguard, the mudguard clip is riveted on to the guard itself, so as to do away with screws as much as possible. This mudguard has a fork attachment, so that if the nut be loosened, and also the nuts on the carrier stays, both mudguard and carrier may be lifted clear away, and the back tyre is rendered accessible. This model has 10-gauge spokes and very heavy rims are fitted. The N.H. engine is a splendid piece of workmanship; the radiator fins are a very fine example of foundry work. Every part of this model has been strengthened and specially made to stand rough usage. The magneto is h.b. controlled, the Bowden operating mechanism being carried on a neat pillar attached to the magneto bed plate. The pedal crank axle is made to work stiffly, so that there is no possibility of the cranks spinning round when the rider desires to mount the machine. In this model ample crank case clearance is provided.

The 3½ h.p. standard model is very similar to the above, except for such small details as the fitting of a smaller tank. To either of these machines the J.A.P. engine may be fitted if desired.

2½ h.p. MODEL: 70 × 76 mm.; B. and B. carburetter; belt; Armstrong three-speed gear.

This machine is fitted with the 2½ h.p. J.A.P. engine, the magneto of which is carried behind. It is interesting to note that the magneto is carried behind in the case of this model, and that fitted with the New Hudson engine. Other special features of the New Hudson machines are the careful locking of the back axle nuts on the spindle to prevent their working loose, gauze filters for petrol and oil, and the special method of bolting the pannier bars to the back carrier. These panniers or toolbags are strengthened by steel strips inside, which are fastened by means of screws to clips brazed on the carrier stay. The method of adjusting the magneto chain is also clever. The finish of the New Hudson is particularly good, and to show that the firm is a thoroughly practical one, we mention the fact that the exhaust pipes are finished in black.

New Hudson three-ring piston.

Notched leg of Clyno stand
are finished in black.

The Olympia Show.—

GRANDEX, No. 57.

2½ h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; belt; N.S.U. two-speed gear.

THE GRANDEX CYCLE CO., Gray's Inn Road, W.C.—An exceedingly neat-looking

the rear seat and is provided with two outside flywheels, which drive aluminium fans, these are friction driven and kept close up against the flywheel by means of springs on the brackets which carry them. An oil reservoir is integrally cast with the crank chamber, and the oil is allowed to flow into the engine by de-

model with spring forks, a very low saddle position, and side flaps to front mudguards. An Eisemann magneto is placed in front of the engine, and is well protected from mud by a large shield. The engine is lubricated by a sight drip feed, the oil being sucked through by crank case vacuum. The foot brake is fitted above the chain stay and operated by a pedal carried on a special bolt.

The above remarks apply also in the case of the 3½ h.p. model, but the 2½ h.p. lightweight differs in several respects. The engine is slung in a loop frame, and the magneto is placed high up behind the engine. All three models are fitted with two important features. Firstly, the carrier and mudguard can be detached from the back stays by means of finger nuts, and, secondly, the pedalling gear can be removed from the bottom bracket by undoing one nut. This is a particularly praiseworthy device, as it allows a counter-shaft gear to be fitted with ease should a customer desire it.

DOT, No. 129.

3 h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; two-speed gear in hub.

THE SERVICE Co., High Holborn, W.C., show, among others, the Dot motor cycle, made by H. Reed, of Deansgate, Manchester. It is especially suitable for sidecar work. Sight-feed lubrication is provided as well as the ordinary hand pump. The starting handle is geared to the back hub by a short chain. The two-speed is operated by a long lever on the left-hand side of the tank. The belt is particularly well guarded from dirt or water thrown up by the road wheels. Druid forks are fitted, and the finish is in red, with aluminium tank having red panels. Handle-bar control is provided for the magneto. Rotherham's filler caps are used. On the Service stand there are also to be seen Clyno, Matchless, Bradbury, Humber, Triumph, Douglas, Zenith, and Rudge-Whitworth motor cycles, as well as the W.D., a most interesting machine which is fully described in the present issue. Service sidecars are made with bodies of two patterns, that with the torpedo front being most attractive.

2½ h.p. Grandex-Precision. Both the tank and top tubes of this machine are dropped at the rear.

lightweight of thoroughly practical design. The motive power is a Precision engine. The steering head is strengthened by an additional tubular stay, and the tank is not clipped to the top tube, so that the top may be more readily cleaned. A new substantial type of carrier is supplied, and a spring-up stand. One example has 24in. wheels and a new type of Precision engine, the magneto of which is carried at the rear. In all cases a tapless oil pump is placed in the centre of the tank, so as to be within easy reach of the rider.

4½ h.p. MODEL: 90 × 96 mm.; side by side m.o.i.v.; belt; free engine in rear hub.

This is a sidecar machine with a disc clutch in the rear hub. The carrier is curved inwards at its forward end, allowing the saddle to be placed in a very low position—27in. from the ground.

KYNOCH, No. 74.

3½ h.p. MODEL (Precision engine): 85 × 88 mm.; side by side m.o.i.v.; Amac carburetter; B.S.A. clutch in rear hub, two-speed gear.

KYNOCH, LTD., Witton, Birmingham, show a motor bicycle for the first time, and their production follows standard lines. The frame is dropped at the rear, Druid forks are fitted, a front wheel stand, and side shields to the front mudguards are provided. The magneto is handle-bar controlled. Every effort is being made to follow the best accepted practices throughout, while the finish, as might be expected, is of the best.

WARRICK TRICAR, No. 86.

6 h.p. MODEL: Single-cylinder; B. and B. carburetter; chain; epicyclic gear in the rear hub.

JOHN WARRICK AND Co., St. Mary's Butts, Reading, and 402-6, Edgware Road, W.—The engine is carried under

pressing a pedal conveniently situated near the rider's heel. The steering is by tiller, which carries the carburetter control, and adjacent to it is the change-speed lever. The rear wheel is suspended on laminated springs. The front wheels are carried by semi-elliptical springs.

O.K., No. 289.

4½ h.p. MODEL: 90 × 96 mm.; side by side m.o.i.v.; Amac belt; Bowden two-speed counter-shaft gear or Albion clutch hub.

HUMPHRIES AND DAWES, Lancaster Street, Birmingham.—This firm is manufacturing three quite new models, all fitted with Precision engines. They have large and well-equipped works capable of turning out 1,000 cycles a week, and are building motor cycles in no half-hearted way. They showed a 4½ h.p.

The 3½ h.p. Kynoch-Jap, which makes its first appearance at this week's Show.

The Olympia Show.—

MATCHLESS, No. 35.

3½ h.p. MODEL: 85½ × 85 mm.; side by side; Amac carburetter; belt; three-speed gear.

H. COLLIER AND SONS, LTD., Plumstead, S.W.—Messrs. Collier and Sons are exhibiting a very complete range of

The Matchless adjustable pulley. It will be seen that the movable flange is screwed on to the fixed flange casting, and being split crosswise is locked by the nut and bolt A.

models. Two of the 3½ h.p. single-cylinder machines are shown with the new Matchless engine, one with a free engine clutch, and a similar machine with a three-speed gear. Their machines are on standard lines throughout, having a low saddle position and a very complete equipment of tools. All fittings, such as stand and carrier, are neatly fixed and carried out in a workmanlike manner. A feature which is bound to attract attention on this stand is C. R. Collier's 7 h.p. racer on which he has attained such marvellous speeds at Brooklands, incidentally capturing two world's records. This machine is the fastest motor bicycle in the world. A neat open-frame model is also shown with a 2½ h.p. engine placed vertically in the frame. This model is supplied with three-speed gear as a standard.

5 h.p. MODEL: 85 × 65 mm.; overhead; Amac; belt; six-speed gear.

This model is similar to that used by the Collier brothers in the Tourist Trophy Race. The six-speed gear is well worth close inspection, and was described in our Tourist Trophy issues. It is sufficient, therefore, to say here that it consists of

an expanding engine pulley, the belt slack being taken up by a simple movement of the back wheel. This movement is very substantially carried out, ensuring rigidity for the back wheel.

Another new model has a 3 h.p. J.A.P. twin-cylinder engine, 60 × 76 mm., with the valves disposed at the side. This is an extremely neat power unit, and should have a great future for those who require an efficient medium-weight twin. On all these models it should be noticed how carefully the mudguarding has been carried out, which is, of course, a very important feature from the rider's point of view. This is the first time the Matchless engine has been exhibited, and it is noticeable that the valve-lifting mechanism and timing gear are particularly neatly constructed. All except the 2½ h.p. ladies' model, illustrated last week, have toolbags on the top tube. Features common to all models are inverted handle-bar levers, a large magneto shield, carrier and stand acting as stays for the

Pedal operating the belt rim brake on the T.T. Matchless.

mudguard, screw-down filler caps of large size, adjustable drip-feed lubricator, and petrol gauge projecting from side of tank. A generator bracket is formed on the left hand fork link.

EXCELSIOR, No. 71a.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; multi-disc clutch in hub to order.

BAYLISS, THOMAS AND CO., Excelsior Works, Coventry.—Quite an interesting point about this machine is the lubrication system. A Best and Lloyd drip

Excelsior power unit, showing long footboards.

feed lubricator is supplied which allows the oil to enter a hole in the cylinder which registers with the hollow gudgeon pin at the bottom of the stroke, while a further lead conducts the oil to the crank case, whence it passes through a channel into a cup in the flywheel, which allows the oil to reach the crank pin and out again through two holes. The same lead also lubricates the main bearing on this side. The pulley side bearing is lubricated by splash, but the oil runs down to the bearing through a special lead from the cylinder. The general appearance of the machine is distinctly pleasing, and it is pleasant to note that this firm has so carefully studied the lubrication question. Reverting to the engine, it is worthy of note that the valve tappets are slightly off-set as regards the cams, with the result that side thrust is minimised to a great extent. The valve stems have a simple adjustment.

4½ h.p. MODEL: 86 × 112 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

This machine is one of the largest single-cylinder machines shown, and has a cubic capacity of 650 cubic centimetres. In all other respects it resembles the model we have just described, except that 2½ in. tyres are fitted and an extra heavy Druid fork. In the case of both models a separate belt rim is carried for the foot brake. The presence of these belt rims accounts for the fact that the rear mudguard is of ample dimensions.

CHARLES EDMUND, No. 100.

3½ h.p. MODEL: 85½ × 85 mm.; side by side m.o.i.v.; B. and B.; belt.

CHARLES EDMUND AND CO., Chester.—The chief feature about this machine is the spring frame. This consists of a separate top tube hinged at its forward end, while at its after end there is a shackle to which a tube is fixed running through the saddle tube, and at the lower

A neat looking 8 h.p. twin-cylinder Matchless-Jap racer.

The Olympia Show.—

end of this the footrests are fixed. The saddle is attached to an extension of this top tube, and at this point the latter forks and terminates in three-quarter elliptical springs which are rigidly fastened at the extremities of the chain stays of the machine. The shackles of these springs are adjustable, so that they may be made to suit riders from nine to sixteen stones. It is also interesting to note that the luggage carrier is hinged at its forward end, while the rear end is attached to the shackles of the springs, so that whatever is carried, either passenger or luggage, it is partially sprung. In this machine, it must be pointed out, not only the saddle but also the footrests are sprung.

LINCOLN ELK, No. 84.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt transmission.

JAMES KIRBY, Broadgate, Lincoln.—This machine follows standard lines throughout. The frame is dropped at the rear, where it is interesting to note that an additional stay runs from the gear bracket to the saddle tube. Druid forks are provided. The two-speed model is interesting, as it is partially chain-driven. The gear is carried on the counter-shaft, and the change is effected by means of external expanding clutches. On the high gear the drive is by chain to the counter-shaft, and thence by belt to the rear wheel. On the low gear the belt pulley on the counter-shaft runs free, and the drive to the rear wheel is by chain.

2½ h.p. MODEL: 76 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt transmission.

A lightweight model, B. and B. carburetter, belt drive, ordinary type frame, is a neat-looking standard machine which follows accepted lines throughout.

KERRY-ABINGDON, No. 76.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt, or Kerry two-speed belt and chain.

THE EAST LONDON RUBBER CO., Great Eastern Street, E.C.—This model is sub-divided into four types, with ordi-

A new Lincoln Elk with selective clutch gear on the counter-shaft.

nary standard frame, the "Cob," with the rear portion dropped, the two-speed model and the T.T. roadster fitted with specially tuned-up engine designed for high-speed work. In all cases the machines are turned out fully equipped for the road, with pannier toolbags, circular belt and tube case at the rear, reflex light, and an excellent kick-up stand engaging with a sensible spring clip on the mudguard. All K.A. engines are now provided with springs under the tappets to reduce noise. The priming device is worthy of notice, as when the needle valve is unscrewed no petrol can flow until a plunger is depressed at the top of the needle valve screw, which is likely to prevent the device from being tampered with. A plate clutch model is also supplied, the clutch mechanism being carried outside the hub, the rear forks being specially widened for this purpose. The two-speed gear, we may remind our readers, works with belt drive on the high gear and chain drive on the low. The gears are changed by means of a dog clutch mechanism in the rear hub. The multiple disc clutch is carried on the engine-shaft.

5-6 h.p. MODEL (Twin): 67 × 95 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

The twin-cylinder model is made in two types, with the ordinary type of frame and with the dropped frame, and also with a multiple disc clutch in the rear hub, similar to that fitted to the single; otherwise its features are the same. A number of sidecars are also on this stand. A large number of machines are exhibited, and altogether the East London Rubber Co.'s stand is an imposing one. We may add that in cases where a two-speed gear is fitted, handle starting is provided.

IVY-PRECISION, No. 99.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt.

S. A. NEWMAN, Lichfield Road, Birmingham.—This is quite an interesting machine. The handle-bars are wide, with crossbar to aid rigidity, and for the purpose of carrying accessories. The front forks are novel in that they provide a direct up and down movement, and also a buffer to allow a slight rocking motion. The forks are best described by saying that they combine the advantages of the Druid with those of the Triumph forks. A front wheel stand is fitted, serving as an additional stay for the front mudguard, which, by the way, has side wings.

5 h.p. TWIN: 75 × 85 mm.

A twin Ivy-Precision is a new introduction. It is a very taking looking mount on standard lines.

2½ h.p. MODEL: 70 × 76 mm.

Other details as above, except that the spring fork is not provided with the buffer referred to in the description of the preceding machine. Also a 3½ h.p. model with ordinary type of handle-bars and spring forks.

4½ h.p. MODEL: 89 × 96 mm.; side by side m.o.i.v.; Amac carburetter; belt; Albion two-speed gear.

This machine is designed specially for sidecar work. The Albion two-speed gear with handle starting to the rear hub is controlled by a pedal. Wide rubber-covered footboards are provided.

New 5-6 h.p. twin-cylinder Kerry-Abingdon with dropped top tube.

The Olympia Show.—

GLORIA, No. 37.

THE GLORIA CYCLE CO., LTD., Much Park Street, Coventry.—The Gloria Co. are exhibiting two Triumph motor cycles fitted with their sidecars, also two side-

cars, one with a coach-built body and the other with a basket body. There are several special fittings which are worthy of notice on these sidecars. The springing of the bodies is much on usual lines, but a particularly neat wheel springing system is employed. The wheel spindle is carried on a U tube which is pivoted to the frame at the front end, the rear end being supported by a very neat enclosed spring. The method of fixing this sidecar to the motor cycle is particularly ingenious, as instead of clipping it direct to a single tube the fixings are so arranged that they grip at least two tubes at once, thereby distributing the strain over a larger area; that is to say, the front fixing grips the top tube and the front down tube, and the back fixing grips the chain stays and back stays. In

the latter case a distance piece is fitted between the stays, so preventing the tubes being drawn together. The stay from the wheel side of the sidecar is carried across the back of the machine and bent round the cycle saddle pin. the size of the valves, flywheels, and radiating ribs, while the cooling fans have been done away with, fan vanes being cast with the flywheel instead. A convex cylinder head is used, enabling the carbon to be cleaned out without detaching

Rear view of Gloria spring-wheel sidecar, which has special three-point attachments.

Rear view of A.C. sociable showing engine cover removed, new design curved mudguards, luggage grid, and hood.

This allows of a particularly low position and at the same time gives ample clearance on rough roads. The fittings throughout are strongly designed, and the mudguards are carried on tubular stays.

MIGHTY ATOM, No. 34.

5.6 h.p. MODEL: 90 x 102 mm.; valves fore and aft, m.o.i.v.; A.C. carburetter; chain; two-speed epicyclic hub gear.

AUTO CARRIERS (1911), LTD., Thames Ditton, Surrey.—Auto Carriers, Ltd., are exhibiting their 1912 model three-wheelers with two and three-seater bodies with and without hoods and screens, and on the same stand there are three commercial vehicles on similar chassis. The chief features for 1912 are an increase in

the cylinder by placing a rag through the valve ports and pulling it backwards and forwards. The front axle is three inches

Vaned flywheel for the A.C. de Luxe model.

wider, giving a considerable increase to the steering lock, and curved mudguards are fitted throughout. A *Modèle de Luxe* is also shown fitted with a new type of two-speed gear, and Sankey pressed-steel detachable wheels. An interesting feature of the exhibit is the number of testimonials received from all parts of the world, which can easily be read, as they are placed in frames all round the stand. Further details of this extremely neat little three-wheeler were published in our issue of November 16th.

MIDGET BICAR, No. 87.

3½ h.p. MODEL: 85 x 88; side by side m.o.i.v.; Amac carburetter; belt; variable speed gear when specified.

J. T. BROWN AND SONS, Oxford Road, Reading.—The main feature of this machine consists in the sheet steel frame strengthened by ash, while the speciality

Latest model A.C. Mighty Atom with curved mudguards. It has a new design engine.

The Olympia Show.—

on the variable gear models is the expanding pulley gear described in *The Motor Cycle* of November 9th. Long footboards are fitted to all machines, and the width of the rear mudguard deserves special mention. The outward appearance of the machine is particularly neat owing to the peculiarity of the frame.

In addition to the above, there is a $3\frac{1}{2}$ h.p. ladies' machine, the frame of which was illustrated in *The Motor Cycle* at the same time as the new variable gear, with which, we may add, this particular model is fitted. The machine specially brought out for sidecar work is the $4\frac{1}{2}$ h.p. 89×95 fitted with the variable gear. Mention must also be made of the lightweight $2\frac{1}{2}$ h.p. 70×76 . Except where otherwise stated the main features are the same in every case.

LEVIS. No. 131.

$2\frac{1}{2}$ h.p. MODEL (Two-stroke): 62×70 mm.; Amac carburetter; belt transmission.

MAHLER BROS., Station Street, Birmingham.—Several of the interesting Levis lightweights are shown on the stand of Mahler Bros. They were fully described in a recent issue. A needle valve replaces the usual petrol tap, and Best and Lloyd semi-automatic lubrication is fitted, but without any pump. $24\text{in.} \times 2\text{in.}$ tyres and wheels are fitted. The lady's model also has a two-stroke engine of $2\frac{1}{2}$ h.p., and a suitably dropped frame and 26in. wheels. The Levis machine is of extremely simple design, and as it is sold at a very low figure should on no account be missed.

$2\frac{1}{2}$ h.p. MODEL (Two-stroke): 70×70 mm.; Amac carburetter; belt transmission.

This model is similar to the one described, but is heavier, more powerful, and has 26in. wheels. Druid forks are standard on all models.

An engine is shown in section to give some idea of the working of the two-stroke principle. This engine, with the exception of the piston, is the same that gave a speed of 45 m.p.h. on the Aston track. A $2\frac{1}{2}$ h.p. model has been timed to travel at the rate of 52 m.p.h. The crankshaft is machined in one piece, and has very wide bearings.

The ladies' model Levis with two-stroke engine.

The new A.J.S. twin-cylinder two-speeder, with foot starter.

MONTGOMERY, No. 60.

W. MONTGOMERY AND CO., Much Park Street, Coventry.—Numerous types of sidecars, the manufacture of which is a speciality of the firm. These are made in

Montgomery "Dreadnought" sidecar, with spare petrol tin carrier.

three types—castor wheel, spring wheel, and rigid. The castor wheel has been strengthened for high-powered machines. The cross-member, which carries the pivot of the castor wheel, is additionally stayed

by members running from the outer of the two main longitudinal stays. All types are fitted with a carrier behind for carrying a petrol tin and a luggage box. The

Montgomery sidecar coupling showing the locking device.

method of attaching the sidecar to the machine is interesting, the points of attachment being fastened by means of a screw ring, which when in position is prevented from turning by a clip, encircling the sidecar tube, and carrying a stud engaging with the ring. When this stud is placed in position, the thumbscrew is tightened and the ring is securely held in position. The rigid model possesses all the improvements mentioned above, while two grades are made of the spring wheel model, one being for machines up to $3\frac{1}{2}$ h.p., and the other for more powerful motor bicycles. The spring wheel is carried on a semi-elliptical spring, fastened rigidly at its forward end, and provided with a long shackle at the rear. Among the various types of bodies we may mention one to which straps are fastened for carrying a spare cover.

The screw adjustment for aligning Montgomery sidecar axle.

V.S., No. 166.

6 and 8 h.p. MODELS (Twin): 76 × 85 and 85 × 85 mm.; belt; V.S. two-speed hub gear.

MARTIN GEIGER AND Co., 44, Clipstone Street, Great Portland Street, W.—On the Hanover Rubber Co.'s stand, Mr. M. Geiger, well known to many as a consistent performer in A.C.U. trials a year or two ago, will be pleased to demonstrate the improvements made to the V.S. machines. The J.A.P. engines have been adopted as standard, an extra large tank is fitted, and among other improvements are large filler caps and 1½ in. belts. The V.S. hub gear is a well-tried pattern, and is one of the few hub gears which enables the engine to be started by a thrust down of the pedals while the wheel rests on the ground. The V.S. 6 or 8 h.p. twin is an excellent sidecar machine.

VICTORIA, No. 217.

Victoria: 70 × 76 mm.; mechanical valves, side by side; B. and B. carburetter; belt.

THE VICTORIA MOTOR CYCLE Co., Glasgow.—This is a well designed lightweight following standard lines, fitted with the increasingly popular Precision engine. The machine is sold properly equipped for the road. The 3½ h.p. mount has also Precision engine of 85 × 88 mm. and N.S.U. two-speed gear. Pannier toolbags are attached to each side of the substantial luggage carrier, and, like the smaller model, this machine follows standard lines throughout. The design remains unaltered, as its excellence has been thoroughly proved in the past.

TYSELEY TRICAR, No. 290.

THE BOWDEN BRAKE Co., LTD., Tyseley, Birmingham.—This machine is driven by an 8 h.p. engine, with V-type cylinders set at 60°. It has mechanically operated valves. The magneto is accessibly placed in front and driven by a short shaft off the timing gear. Gas is supplied by a Zenith carburetter. The engine and gear box are on the unit system. The gears work on the sliding principle, giving two speeds and reverse. The clutch is of the multiple disc type. Behind the gear box is a short cardan-shaft universally jointed at each end, and behind this is a bevel drive, whence power is transmitted to the wheel by means of a single chain. The control is arranged on car lines; an accelerator pedal is provided with two notches, the first allowing the throttle to be opened enough for starting and slow running. The body is coach-built and provided with high side door. The radiator is in front, following car lines. A runabout is also manufactured with four wheels and worm transmission.

LADIES' QUADRANT, Nos. 93 and 94.

On Monday morning a lady's model Quadrant (70 × 76 mm.) arrived. It has mechanically operated valves side by side. This is quite a practical open frame machine. The tank is carried at the top of the loop frame, and from its lower extremity to the saddle tube extends a flap which protects the skirt from the engine, and, since the latter is exposed to the air all round, the cooling draught is not interfered with in any way. An Armstrong three-speed gear is fitted, also handle-bar control to the magneto.

ACCESSORIES OF THE SHOW

AVON RUBBER CO., LTD., Melksham, Wilts (No. 150).—In addition to a large range of motor cycle tyres of various patterns, rubber-studded, grooved, and combination of large rubber studs and steel studs, the Avon Rubber Co. are showing a 650 x 65 mm. tyre suitable for powerful sidcar machines. This tyre has an unusually large amount of rubber on the tread, and should prove most serviceable. It is made with a plain tread and in various non-skid patterns. There is also an excellent selection of repair outfits.

BOWDEN CONTROL, No. 263.

BOWDEN WIRE, LTD., Camden Town, N.W.—Besides the fine array of the numerous Bowden wire control mechanisms which have not required much modification since last year, and which are sufficiently well known, the Bowden two-speed gear, which is shown fitted to an Ixion-Precision engine made by the Whittall Engineering Co., Ltd., claims attention. To attach the gear to the frame a newly-designed bracket has been introduced. This is of inverted hollow rectangular section cut away at the top to give accessibility to the pin holding the gear casing to the bracket and to allow easy removal. The combined foot and hand control mechanism, by which the gear can be operated entirely by foot and merely locked by the ratchet on the hand lever, or by which it can be separately controlled by the hand, has already been described in these columns, as also the mechanism.

J. H. HELLER, Colverston Crescent, Golders Green, N.E. (No. 52), is showing a selection of lighting-up-time watches and stencils for registration number plates.

WOOD-MILNE, No. 46.

WOOD-MILNE, LTD., Ribbles Bank Mills, Preston.—The above firm are specialising in three differently treaded tyres. These are a rubber-studded, what

steel studs fitted in the grooves. It is claimed for the "Griprib" type that the formation of the ribs prevents the tyre sticking in a tram-line, prevents motion between tyre and ground, thus minimising skidding. All these tyres, also the Wood-Milne motor cycle belt, are manufactured of a combination of steel wool and rubber, and, though smooth when new, the steel

The new Wood-Milne rubber-studded tyre.

wool creates a rough surface which, in the case of the belt, grips the pulley in spite of wet and mud, and in the case of the treads forms an additional non-skid. On this stand was a neat foot-pump primarily designed for car users, but which would form a useful addition to a motor cycle garage. It is very powerful in action, being operated through a system of toggles, and folds up into a very small space.

MOEBIUS AND SON, Stoke Newington, N. (No. 272).—This firm show a selection of motor oils and greases suitable for all types of machines in all countries. They also specialise in their Challenge brand carbide, metal polish, and tyre paint.

TERRY SPECIALITIES, No. 230.

HERBERT TERRY AND SONS, Redditch.—This exhibit, of course, displays a noble array of springs for valves, cycle saddles, clutches, and all the thousand and one purposes of motoring. The double and single locknuts have been already described in *The Motor Cycle*. Among the many spanners, the Turbine spanner combines the advantages of the solid jaw with the adjustability of the ordinary wrench, and is a particularly handy tool. These may be described as solid jaw spanners fitted with packing strips, threaded on a bolt in such a position that any required number of packing strips may be swung in between the jaws when required. Tyre levers, clips for various purposes, and many other accessories, too numerous to mention, complete the display on this stand.

BRAMPTON BROS., LTD., Oliver Street, Birmingham (No. 237).—The Brampton roller chains in various sizes for motor cycle transmission demand attention, and the firm are also bringing out one for magneto drive. This latter is of 1/2 in. pitch. These well-known chains are of nickel steel with all wearing parts hardened. Besides chains this firm are also exhibiting a variety of hubs, pedals, and footrests specially designed for motor cycle work.

VACUUM OIL CO., LTD., Westminster, S.W. (No. 226).—Before the days of motors Vacuum oil was a well-known engineering product. Recently the firm have introduced a new brand of oil, viz., their T.T. Mobiloil for speed work, while for touring they recommend their well-tried Mobiloil B. The firm are fully alive to the possible requirements of two-speed gears, for which purpose they recommend Mobiloil C, which is the thickest grade of gear oil turned out by them.

COVENTRY CHAINS, No. 208.

COVENTRY CHAIN CO., LTD., Spon End Coventry.—The exhibit is interesting in its reflection of car practice, for, first and foremost, we find a beautiful little inverted tooth chain for magneto drive. At present all the transmission chains for motor cycles are of the roller type. A special chain for motor cycle work is a 1/2 in. pitch roller by 1/2 in. wide, with nickel steel side plates and rollers of hardened high tension carbon steel. The firm have introduced a new 1/2 in. pitch roller chain, provided with extra strong side plates and the usual "nose," which is a feature of the Coventry chain and prevents the side plates from cracking where the stress is greatest.

COWEY ENG. CO., LTD., Kew Gardens, S.W. (No. 221).—Simplicity and substantial construction mark the Cowey speed recorders, which are shown in four varieties to register up to 40, 60, and 80 miles an hour, and also up to 100 kilometres. These instruments record mileage up to 10,000. Usually they are fitted

The latest Cowey speedometer and mileage recorder.

Wood-Milne non-skid cover.

is termed the "Griprib" pattern, which consists of two grooves, the outside ribs being joined to the centre one alternately, about four inches apart; and the combination tread of the "Griprib" type with

on the right hand front fork, but their design is such that should it be necessary to place the instrument on the left hand fork, all that has to be done is to remove the cover of the small casing enclosing the driving gear, turn the worm gear around, and replace the cover.

The Olympia Show.—

CAPON - HEATON AND Co., LTD., Stinchley, near Birmingham (No. 153).—All kinds of rubber goods are to be seen on this stand. The Capo motor cycle belt should be examined.

GORTON RUBBER Co., LTD., Openshaw, Manchester (No. 169).—The standard tyre for 1912 is one with elongated studs placed in various directions on the tread. This should prove a most effective non-skid. Another pattern is a tread of square shape with a series of hollows along the centre. Both these tyres are made in all the usual sizes. Samples of inner tubes are also exposed to view.

BROWN AND HINGSTON GEAR, No. 50.

R. T. SHELLEY, LTD., Aston Brook Street, Birmingham (No. 50).—Shelley's stand is well worth a visit from any keen motor cyclist, as besides the Brown and Hingston hub two-speed gear, which has already been illustrated and described, they are showing almost every possible form of motor cycle, tools, and tool kits. They also have a selection of motor cycle lamps, among others a lamp fitted with a Mangin mirror reflector. The chief item on the stand is a standard $3\frac{1}{2}$ h.p. Rudge with the Shelley hub showing how it can be operated either by a single lever or by a pedal which operates the high gear and a ratchet lever placed on the top tube operating the low. The latter form of control is advocated by the manufacturers, as it enables the low gear to be used as a brake. R. T. Shelley, Ltd., claim to be the largest manufacturers of tyre levers in the world.

LEICESTER RUBBER Co., Granby Rubber Works, Leicester (No. 151).—The John Bull motor cycle tyre shown on this stand is made under enormous compression, and is constructed on the lines of a car tyre. This method of manufacture results in a tyre that has great durability.

LYCETT SADDLES, No. 228.

LYCETT SADDLE AND MOTOR ACCESSORIES, Co., LTD., Birmingham. — The pan seat on this stand with the edges curved upwards was illustrated in our last issue. Besides this departure, Messrs. Lycetts are exhibiting their Tourist Trophy motor cycle saddle which was

attached bag, which is arranged so that by means of four studs and a clip it can be rapidly attached to or detached from the carrier of a motor bicycle by hand. Besides these there is a great variety of

A new spring Lycett saddle, enabling a low position to be attained.

motor toolbags, motor cycle saddles, and the famous Lyso belt, which is too well-known to need description.

ROBERTS MOTOR TYRE Co., St. Mary's Road, Birmingham (No. 146).—The Vulco series of motor cycle sundries are shown here, also the Roberts motor cycle tyres, belt, and liners.

RICH AIR TUBES, No. 227.

THE RICH PATENT DETACHABLE AIR TUBE Co., Crawley, Sussex.—Among the covers on this stand are two which are not new, but have the remarkable record of having performed 3,500 and 4,500 miles respectively on the back and front wheels of a motor cycle that went all through the London and Edinburgh run besides a six-day record. Throughout, we are told, the front wheel never sustained a puncture, and both were in excellent condition; the fact that one or two punctures on the back wheel only occupied a few minutes was due to the Rich detachable tubes, which are so arranged that the one end fits into the other, while the pressure keeps the joint tight, thus permitting a free circulation of air. The Rich tube is most popular with competition riders.

CONTINENTAL, No. 163.

CONTINENTAL TYRE AND RUBBER Co., LTD., Thurlow Place, S.W.—These tyres are shown in four patterns—beaded, studded, basket work, and combination treads, the latter consisting of oblique rubber bars extending nearly halfway across the tread, alternating with steel studs. The Continental rubber belt is also shown in various sizes, and an assortment of route books with maps which are published by this company.

MAX STEINER, Scrutton Street, E.C. (No. 222).—This firm have an imposing array of belts, both round and V shape. Of the former three distinct varieties in different materials are shown. Some of these round belts are made in two halves of semi-circular section. Another very interesting type is made of strands resembling a miniature rope, in appearance like the ordinary twisted variety. Other items which deserve attention are a good range of horns, including an unusual type called the Serpentine, and the Maxim separate generator lamp and brass-plated lamp, sold at a moderate price, and riveted throughout.

CHAS. MACINTOSH AND Co., LTD., Cambridge Street, Manchester (No. 159).—The most interesting article on this stand is the Stuart lock-joint motor cycle tube. This tube has a rounded butt which fits into a similarly shaped socket. The ordinary endless tubes and a variety of tyres are also shown.

THE PYRO SUPPLY Co., Coventry (No. 213), show some interesting examples of brake blocks for belt and wheel rims. These are made of a mixture of vegetable fibre and graphite, and so ought to be free from any dithering tendency. It is claimed that they neither slip, shrink, nor glaze. The "Pivotal" side mud shields and Drainer mud flaps are also exhibited.

PATCHQUICK, No. 214.

WOODGATES BROS., Tiverton, Devon.—The "Patchquicks," which have been produced to dispense with the necessity of vulcanising, are already fairly well known in the motor cycle world, and are made in various shapes, square, oval, and oblong. Moreover, this firm are now producing a continuous strip of "Patchquick" to go round the complete circumference of the inner tube to reinforce a weak or porous place. These devices appear to be of remarkably fine quality. We have seen one or two samples over five years old that appeared to have retained all the attributes of high quality rubber intact. The "Patchquick" Fix for use in conjunction with these makes a thorough joint.

THE ROMAN RIMS, LTD., Upper Priory, Birmingham (No. 238).—The Roman Rim, Stand No. 238 in the Gallery, exhibit, for the first time at Olympia, a Roman rim for motor cycles, manufactured in one homogeneous piece of metal without joint, seam, rivets, or welding.

THE MERKHAM TRADING Co., LTD., City Road, E.C. (No. 219).—The item on this stand that will most appeal to motor cyclists is the Davis nail catcher, which is admirable on account of its simplicity. It consists merely of a copper wire stirrup, curved to fit the tread of the tyre and flattened.

HOLDTITE, No. 140.

R. SURRIDGE AND Co., 58, George Street, Camberwell, S.E. (No. 140).—The Holdtite patches are reinforced with a fabric which stretches in one direction but not in the other. When properly applied to a split in the tyre they are capable of withstanding great strain.

Hunt's generator tubing with specially strengthened ends.

Some air tubes patched in this way are shown with heavy weights attached to demonstrate the non-stretching properties of the patches. Other lines are the Surridge bulb patch and a generator tube with thickened ends to prevent splitting. We have already referred to the non-inflammable solution in previous issues. This is supplied in neat metal cases with screw tops.

Lycett's new toolbag fastening.

first tested in the Isle of Man this year, but has been somewhat improved, in that it has a girder main frame, and the clip is consequently suitable for any ordinary "L" pillar. Another item worth noting on this stand is the new design of

The Olympia Show.

THE MONOVO Co., Stewart's Road, S.W. (No. 144).—This stand contains an assortment of oils, rubber goods, repair outfits, lamps, pumps, carbide, etc.

C. W. BLUEMEL AND BROS., Wolston, near Coventry (No. 205).—On the Bluemel stand are to be found some very useful and admirably arranged side-flaps for mudguards. These are made of well-enamelled sheet metal formed so as to lap around the beading of the guard itself to which the flap is held by light but strongly and neatly designed clips which grip the mudguard beading on both sides when tightened up by hand with small butterfly nuts. The same firm are exhibiting some new and substantial patterns of black handle grips, which, with their coloured bands, have a handsome appearance and afford a good grip. No modifications have been found advisable in the Bluemel motor cycle tyre pump.

PEDLEY, No. 23.

J. PEDLEY AND SON, LTD., Great Charles Street, Birmingham.—This firm specialise in a three-ribbed cover. We have examined the tread, which is very heavy in section and promises to give long life, while the three ribs should minimise side-slip. A large selection of brake blocks and accessories were also shown to us. Retreading covers with either grooved herringbone or studded treads is a speciality of this firm. A novel exhibit is the Pedley belt, which has a strip of pure Para rubber on the top, which, it is claimed, prevents the usual cracking.

THE XL'ALL Co., Moseley Street, Birmingham (No. 117).—On this stand are shown two Bradburys, two Matchless, two Clynos, one Triumph, one Norton,

XL'All metal dust covers for fitting over the chain rivets.

and one Rudge, all fitted with XL'All specialities. These include the well-known XL'All pan seats, in which the seat is designed anatomically and gives a great deal of support to the body besides being extremely well sprung. A very neat device shown on this stand is the new XL'All chain cover, which consists of a number of small rectangular stampings which slip on to each link of a chain and travel round with it, at the same time providing a protection which prevents the ingress of mud and dust. The saddles are shown in ten different types, whilst the chain cover is also made to suit all standard sizes of chain.

CLIPPER WOOD RIM, No. 25.

CLIPPER TYRE Co., LTD., Steelhouse Lane, Birmingham.—Three types of Clipper covers are shown, one with three ribs, one with a combination rib and stud, and one with three ribs joined at intervals by cross bars. The latter is termed the Reflex Clipper Ideal, and is extremely stoutly constructed and suitable for heavy wear and tear. A very neat repair outfit is supplied, consisting of a leather roll containing a flask of the same material for rubber solution which has a really airtight cap to which is fixed a brush for applying the liquid, also

a wire brush for cleaning the tyre and patch, a shaped repair band, patching material for repairing the cover, and Clipper Perfect tube patches. The whole rolls up into a small space, protecting the tins and preventing rattle. A distinctly novel feature is the wood-rimmed motor

The new Clipper rubber-studded cover.

cycle wheel, in which the steel rim is mounted on a wooden felloe. It is claimed that this rim greatly reduces road shocks and prolongs the life of the tyre. We hear that several well-known riders are using them with great success.

THAMES, No. 48.

THE THAMES RUBBER AND LEATHER Co., Upper Thames Street, E.C.—This firm are selling a combination rubber and steel-studded tyre which from appearances should be an effective non-skid; also a rubber-studded and a steel-studded cover. Any of these three patterns can be fitted as retreats to existing tyres. They are also showing both butt and dome ended tubes, rubber and canvas belts, a large selection of brake blocks, and a specially long pump connection formed of flexible steel tubing.

ALBERT H. HUNT, Cannon Street, E.C. (No. 229).—Among the many novelties on this stand is a compact little combination switch and magneto cut-out for clipping to the handle-bars. It is worth while for motor cyclists to note that on this stand Hellsen dry cells are being presented to any purchasers of the H.A.H. coil. This coil is also the least expensive. Another very handy item that will appeal to many motorists are the little circular tins containing a roll of insulating tape. These are just what is wanted. They

New plug terminal sold by A. H. Hunt.

Hunt's sparking plug cover for all-weather use.

pack well, are cleaner, and the inner space inside the cardboard centre around which the tape is wound leaves room for any small screws, etc., that may have to be carried. A new induction coil for use on single-cylinder engines and with two high tension terminals for the sparking plug is on view. The coil winding is specially arranged so that the sparks take place simultaneously in both plugs.

FIRMAX, LTD., Yeovil (No. 142).—Firmax, packed in various sizes, is shown here put up in tins ready to be pumped into the tyres. Firmax is a dry powder, and therefore does not interfere with the mending of large cuts in the cover, and it is the only puncture sealer which has gained the R.A.C. certificate.

ROM, No. 157.

THE ROM TYRE AND RUBBER Co., LTD., 31, Brook Street, London (No. 157).—This exhibit consists of a display of the well-known Rom tyres, the most popular pattern being the combination rubber band and steel studded, which is noted for its non-skidding properties under all conditions. An all rubber non-skid is also made with a triple row of square rubber studs.

SELF-SEALING RUBBER Co., LTD., Ryland Street, Birmingham (No. 165).—The Hermetic motor cycle tyres and self-sealing tubes form the principal part of this exhibit. These include rubber and steel-studded covers and an extra heavy tricar tyre. Tyre gaiters, security bolts, Fixxvik patches, and other rubber goods are to be seen. This company specialises in retreading.

Two-way switch, one of many new accessories by A. H. Hunt.

ERNEST H. HILL, LTD., Broomhall Street, Sheffield (No. 215).—Some good examples of motor cycle foot inflators fitted with stirrups. These are made in polished brass, nickel-plated on brass, or celluloid. For motor cycles, too, this firm also make some very useful mirrors for fitting to the handle-bars. These are glazed and made in two qualities and in four or five inch sizes. A useful article is a combined petrol and oil squirt designed to be fitted in a socket easily attachable to the diagonal tube of the frame.

SHAMROCK-GLORIA, No. 166.

HANOVER RUBBER Co., Old Street, E.C.—There are here a great variety of motor cycle tyres, many patterns of treads being made, corrugated rubber-studded and ribbed all being standard. In addition, two combination covers are made, one with rubber bars and steel studs, of which the company have sold a great number for sidecar work, and another with a tread consisting of a leather band with steel studs. The Shamrock-Gloria rubber belts are also to be seen. In the centre of the stand is a Triumph fitted with Shamrock-Excelsior tyres and a Gloria belt.

The Olympia Show.—

THE NORTH BRITISH RUBBER CO., LTD., Castle Mills, Edinburgh (No. 27), are making a feature of their special Dreadnought non-skid tyre. The tread, which has been thickened since last year, is of the combined rib and stud pattern, and is mounted on four-ply canvas. The company are also showing various grades of studded and plain ribbed tyres. Details of the popular Clincher tyre were given in a recent issue.

BROOKS'S SADDLES, No. 279.

J. B. BROOKS AND CO., LTD., Great Charles Street, Birmingham.—As usual, Messrs. Brooks have a superb exhibit of

Brooks's new pannier bag, with extra spring button fasteners at each corner.

their motor cycle saddles and toolbags. Among the new patterns is the B104, which is a new design for 1912, affording a lower seat and more resilience. Two new patterns of anti-vibratory seats are also on view, and these are notable for giving more ample accommodation and greater comfort. An example of a motor cycle carrier gives some idea of the possibilities of transport, for it is fitted with every sort of leather case that can be imagined. Among these is a handy little case for repair outfits. Some of the motor cycle pannier toolbags have been strengthened, and one pattern, which is in two sizes, B719 and B5.259, is fitted with a neat spring lock in front, and is also provided with straps in the front to guard against loss of tools if the lock is carelessly or not properly shut.

LAKE AND ELLIOT, LTD., Braintree, Essex (No. 220).—Though this stand is devoted entirely to items supplied to the trade, the new Millennium "Fit All" gear demands attention, having been redesigned and reconstructed throughout. It is of the epicyclic type, the planet pinions rotating on pins secured to the main casting. This latter externally takes the form of a brake drum. On the low gear it is held stationary. The engine then drives the sun pinion, which in turn revolves the driven planet pinions, which are of comparatively large size, and so should keep the rotary speed of the planets within reasonable limits. On the same sleeve as the driven planet pinions are the drivers of similar size, and these mesh with a comparatively large spur gear secured to the engine pulley. Thus the number of revolutions is reduced and the power increased. For the high gear, the band brake is released and a flat plate clutch is brought into action. This connects the drum or body of the gear with the engine-shaft, and the whole revolves solid, giving a direct drive. An interesting two-speed hub is also shown working practically on the same principle and operated by a bell-crank mechanism. In this the

gear and hub form a complete whole, but the two are practically separate entities, which enable the two-speed principle to be applied to the hub of existing machines without serious constructional alterations.

MOSELEY, No. 45.

D. MOSELEY AND SONS, LTD., Ardwick, Manchester.—The above firm are specialising in a grooved motor cycle tyre. The chief claim of the makers is that the tread is always in compression, so that any cuts have a tendency to close automatically. A layer of rubber is interposed between each layer of canvas, which reduces friction and should prevent bursts. The tyre is of heavy section, and the deep grooves should tend to prevent sideslip. A large range of patches and tyre plasters are also to be seen, both moulded and flat, also a selection of fibre brake blocks and fibre and vulcanite tubes for enclosing high tension leads.

THE B. F. GOODRICH CO., LTD., Golden Lane, E.C. (No. 22).—A speciality of the new model Goodrich tyres is a cover round the tread of which a central rib runs, and on either side are widely spaced studs. There is a flap inside preventing the tube being nipped or jammed against the spoke heads. The close studded cover, 650 x 65 mm., designed to suit 26 x 2½ in. motor cycle rims, is a splendid piece of work. It is beautifully made and is a fine example of tyre construction. These tyres are strongly constructed, and this our readers will appreciate when we mention that the first-named cover has three plies of canvas and the last-named four plies. The Goodrich butted tube has been reduced in price. Our readers will remember that it is provided with a flap to button over the valve, thus securing the joint in a safe and efficient manner.

EISEMANN MAGNETO, No. 18.

THE EISEMANN MAGNETO CO., Berners Street, W.—Two new models of the Eisemann magneto, with mechanism entirely enclosed, and thus both oil and wet-proof. This type of magneto is made in two sizes, up to 2½ h.p. and up to 3½ h.p. The chief alteration in the design is the employment of peaked pole pieces, which lead the lines of force direct through the core of the armature, and in the case of this magneto the lines of force are not distorted. The effect of this, the makers claim, is a very hot spark at slow speeds, while it allows the magneto to be used on an engine the cylinders of which are set at 90°, and it must be remembered that for such an engine it has been a very difficult job to make a magneto. The 90° engine, as is well known, gives great advantages as regards balance, and it is possible that in the future more of this type will be seen. A minor improvement is the fitting of a spring over the central bolt which holds the contact-breaker on to the end plate, which prevents any possibility of the bolt jolting loose. On the standard type of machine—that is to say, with the mechanism not entirely enclosed—a waterproof high-tension terminal is fitted. It is in-

teresting to note that the magneto has been used with great success on the Rudge-Whitworth, and behaved in an exemplary fashion during W. Stanhope Spencer's recent record rides. All Eisemann magnetos are provided with a special mark on the exterior of the magnets, so that if they are removed there is no excuse for them being put back wrongly. The

The new model weatherproof Eisemann magneto.

firm also make a speciality of magnetos for V type engines for any angle of cylinders.

HUTCHINSON TYRE CO., Basinghall Street, E.C. (No. 26).—The Hutchinson Tyre Co. are exhibiting three patterns of motor cycle tyres—Rubber studded, ribbed, and one with a non-skid tread on the basket-work principle. Hutchinson tyres were dealt with in our issue of the 9th with the exception of a 650 x 65 mm. extra reinforced suitable for high-powered sidecar combinations or runabouts. The company are also exhibiting a useful motor cycle boot which consists of a leather sole on which is mounted a thick rubber boot. This is extended right up to the thigh, the extension being made of waterproof material. A projection is fitted near the heel of the boot, by means of which the boot can be taken off without the necessity of gripping the muddy portions.

MILLER LAMPS, No. 239.

H. MILLER AND CO., LTD., Miller Street, Birmingham.—The Miller lamp is exhibited in three patterns. In all, however, the details of the lamp are essentially the same. All are fitted with a mirror reflector, a lens glass, and a fish-tail burner capable of a sliding adjustment forwards or backwards to obtain perfect focus. A feature about these lamps is that they can be adjusted to any angle on the bracket. In Nos. 24 and 25 the lugs on the lamp body give this adjustability, but in No. 27 it is the bracket itself that performs this office. In either case the principle is the same—one fixed and one movable disc to each clamp, both being serrated so that the two can be clamped together practically at any angle. All the lamps are exceedingly well finished. Nos. 24 and 25 are designed to secure to the ordinary existing lamp bracket, while No. 27 is carried on a bracket which is secured to the steering pillar, and allows for angular adjustability. For No. 26 a double bracket carrying the lamp in front and generator at the back is provided; in other cases the generator can be secured to the forks or frame of the machine. It should also be added that, while No. 24 has an ordinary reflector mirror, all the other types are fitted with Mangin lens mirrors.

New design Eisemann plug.

STAND No. 50, OLYMPIA.

THE ONLY GEAR FOR SIDECAR WORK.

50% reduction on low speed, free engine on either speed, engine can be started by pedals with back wheel on ground. Micrometer adjustment to clutch accessible from outside. Only two toothed wheels, both gears and clutch large enough for car work, NO CLOCK WHEELS. Ball bearings everywhere all adjustable from one cone.

CAN BE FITTED TO ANY STANDARD MACHINE WITHOUT ALTERATION TO FRAME.

PRICE OF HUB WITH BELT RIM £10 10s.

COMPLETE WHEEL, READY TO FIT TO ANY STANDARD MACHINE (less tyre) £12 10s. including control gear.

cation "WHY."

HUTCHINSON TYRE CO.,
70, Basinghall Street, E.C.

"Distinct from all Others."

In answering this advertisement it is desirable to mention "The Motor Cycle."

The Olympia Show.—

W. AND A. BATES, LTD., St. Mary's Mills, Leicester (No. 28).—This old-established and reliable rubber manufacturing firm exhibit a large selection of motor cycle tyres. Their chief feature is a new ribbed tyre with a very broad central rib. They also show a neat tube gaiter, which can be laced round the tube in a short time. An exhibit on their stand which is bound to attract attention is H. B. Karslake's historic Dreadnought, which is fitted with Bates tyres, and will be well-known to most of the motor cycle world.

LUCAS LAMPS, No. 235.

JOSEPH LUCAS, LTD., Birmingham.—Motor cyclists should certainly see the new pattern acetylene head light with cage carbide holder. This cage generator is only applied to the larger pattern of

Lucas combined lamp and generator bracket fixing.

lamp No. 462. J. Lucas, Ltd., make motor cycle lamps in four different sizes, the smaller sizes making use of the ordinary generator. This is adapted to be secured either to the frame, handle-bar, or front forks as desired. Lucas lamps and generators can be fitted on all the different makes of motor cycles in use to-day. Among other items on Lucas's stand are a very nice observation mirror

(see sketch) and two standard pattern horns, one curled to encircle the handle-bar and bring the bulb into a convenient position. Both this and No. 32 are fitted with a clip arranged so that the curl can encircle the handle-bar if necessary. We can testify that the power of these horns is most effective. The combination brackets

Lucas adjustable handle-bar mirror.

for carrying the lamp, in front and the generator behind the bar can be supplied either to clip to the handle-bars or to the steering-pillar, and can be attached to practically any make of machine.

PRICE'S PATENT CANDLE CO., LTD., Battersea, S.W. (No. 210).—This firm not only specially studies the requirements of individual makes of engines, but of the different seasons, and their *huile de luxe* is made in various viscosities, the latest being a thick oil specially produced for summer use. The other particular products of this firm—including Rangraphine (a chain lubricant), Rangoon oils and jellies for rust prevention, and Manulav (their grease-removing soap)—are all too well known to require description.

ARMSTRONG GEAR, No. 33.

ARMSTRONG TRIPLEX THREE - SPEED GEAR CO., Icknield Street, Birmingham.—The well-known Armstrong Co. are exhibiting two models of their hub three-speed gear. One is for standard engines up to $3\frac{1}{2}$ h.p. for solo work. The other is fitted with double the clutch area, and is suitable for sidecar mounts up to $3\frac{1}{2}$ h.p. The quadrant has been enlarged, and the leverage increased, and it is probable that the firm will market a detachable clip for fixing the control to the top tube. The standard gear ratios are 5, 7, and 10 to 1. These, of course, are subject to the size of the pulleys, but serve to show the difference of ratio. This gives a very wide range and enables the machine to be started at walking pace with ease. A description of a visit to the Armstrong works was given in our issue of the 16th November.

THE PALMER TYRE, LTD., Shaftesbury Avenue, W.C. (No. 164).—This company, in addition to their usual patterns of cord and fabric tyres, are making for 1912 a new tyre of cheaper pattern called "The Privateer." This has a new design of non-skid tread consisting of a wide band in the centre and two ordinary bands on the edges. Palmer tyres are made as before with studded or ribbed treads, the cord tyre being made in precisely the same way as the car tyre. All their tyres are fitted with what they call a danger signal tread, which consists of a strip of red rubber between the canvas and the inner portion of the tread. When this red rubber is seen the tyre should be retreaded, and in the case of cord tyres it is claimed this can be done twice before the cover need be discarded.

DUNLOP, No. 158.

DUNLOP PNEUMATIC TYRE CO., LTD., Aston, Birmingham.—Dunlop and Warwick tyres are shown in considerable variety. As well as last year's pattern, with central groove and studs to side, the 1912 Dunlop motor cycle tyre is made with three rows of studs which are much elongated in shape. The Warwick tyre is made with round studs. A tyre for heavy powerful machine and sidecar work (650 x 65 mm.) follows the lines of the well-known Dunlop car tyre. The Dunlop belt, which is very successful, is to be seen, also a new belt case. Of course, the usual assortment of tyre repair outfits and other items connected with tyres are on view.

C. C. WAKEFIELD AND CO., Cannon Street, E.C. (No. 266).—The Wakefield display of samples of their oil calls to mind the numerous noteworthy performances and successes achieved with the aid of Castrol. It may be remarked that it was the oil which lubricated the winning engines in the Senior Tourist Trophy. The fact that this firm have won thirty-five medals out of a total of sixty-four is quite sufficient to demonstrate the remarkable excellent qualities of this lubricant.

KERRY, Nos. 21 and 273.

EAST LONDON RUBBER CO., Great Eastern Street, E.C.—This company specialise in tyre covers, which are manufactured in three different patterns: A grooved, rubber-studded, and one with a tread on which each letter of the name "Kerry" is formed of studs to act as an

anti-skid device. Their butt-ended tubes are particularly strong at the joint. This firm make a great speciality of their motor cycle clothing. They manufacture

The East London Rubber Company's clutch which has been designed especially for lightweight motor cycles.

several neat forms of coat, leggings, and waterproof rubber and leather gloves. On Stand 273 there is an interesting novelty in the shape of an automatic feeding oil pump. In the pump barrel, which is connected up with the oil tank, is a piston pushed upwards by a fairly strong spring. When this piston is depressed by hand, oil is drawn in from the tank above the piston. The spring then acts on the plunger, forcing it upwards, and the oil above the piston is forced out through a sight-feed regulated by a fine adjustment, and passes to the crank case as required. A very nicely made little tool is the Rose patent combined belt punch and cutter. An exhaust whistle so designed as to pass

Section of the Atlas non-puncturable inner casing, showing how the steel discs overlap. This band is being shown on the East London Rubber Co.'s stand.

all the exhaust through the whistle may appeal to some. The Atlas non-puncturable inner case has not been previously exhibited at a motor cycle show. It consists of a casing placed inside the tyre, in which steel discs are placed in three layers, so that one overlaps the other, thus rendering it impossible for any puncturing agent to reach the inner tube. The ends of the casing are allowed to overlap, and it is attached by solutioning about $\frac{1}{4}$ in. of its width to the cover. The Bobbett levers consist of a stop and two tyre levers, each of which has a small leg near the hook end. The hook is placed inside the rim and the lever pressed forward, when the leg catches in the rim and holds the lever in position. First of all it is necessary to fix the small stop, supplied with the set, which remains where it is until the whole cover is on. Once the stop is fixed, first one lever and then the other is used. The levers are most useful in the case of a refractory cover.

The Olympia Show.—

AUTO CYCLE UNION, Piccadilly, W. (No. 172).—Motor cyclists should call at this stand and obtain information on the many advantages of membership.

DALLISON GEARING CO., Princes Chambers, Corporation Street, Birmingham (No. 133).—This company are showing a motor cycle fitted with the Dallison five-speed gear, described and illustrated in our columns on November 9th. The Dallison silencer, which contains a series of hanging baffle plates set at different angles, was also described on the same date.

DUNKLEY, No. 138.

W. H. DUNKLEY, Arrowville, Alvechurch, near Birmingham.—Eight models of sidecars are shown on this stand. The Dunkley coach-built sidecar is very complete, having a torpedo front, screen, and Cape hood. The Chatsworth is a cane torpedo-fronted sidecar painted green with a space for tools in the rear.

MIDDLEMORE AND LAMPLUGH, LTD., Little Park Street, Coventry (No. 240).—This firm is showing a large selection of

The Middlemore back rest. The dotted line shows the position it assumes when folded out of action.

motor cycle saddles, and makes a special feature of the new back rest which can be instantaneously lowered by depressing a small trigger. A variety of mudguards is also on view.

BLUMFIELD, No. 55.

BLUMFIELD, LTD., Lower Essex Street, Birmingham.—A most interesting display of engines is to be seen on this stand. Sizes: $3\frac{1}{2}$ h.p. single, 80×95 mm.; 4.5 h.p. twin, 67×83 mm.; 5.6 h.p. twin, 67×95 mm.; 7.8 h.p. twin, 80×95 mm. All these are air-cooled. The following water-cooled engines are also made: 4.5 h.p. single, 81.5×95 mm.; 8 h.p. twin, 81.5×95 mm. The water-cooled engines are fitted with valves having adjustable stems. These are provisionally protected and will be illustrated next week. The valve lifter on the twin engines has been improved. Sections of the engines are shown, and that showing the oiling arrangement should not be missed. The oil is pumped into the timing gear instead of into the crank case, thence it passes through the crank bearings and through ducts to the big end and so into the crank case. The magneto chain cover can be taken off after turning aside two spring clips such as are used on the contact breaker cover of a magneto. The turret nuts which hold the inlet and exhaust pipes in position are grooved to prevent the spanner from slipping. The adjustable pulley remains unaltered, and is most simple and easy to manipulate.

CUTHBE AND CO., Great Eastern Street, E.C. (No. 287).—Besides the belt on this stand the Max Cycar tyre, for heavy work with powerful machines, will interest the motor cyclist, as also will the butt-ended detachable tubes shown by this firm. "Leakure," too, is a remedy that is worth attention for sealing punctures while riding, while for the Climax tyre stopping great rapidity of use and effectiveness are claimed.

SEABROOK BROS., Great Eastern Street, E.C. (No. 241).—The chief specialties of Seabrook Bros. are the Solar motor cycle lamp and generator, which are both well designed and soundly constructed articles, and have been previously described in detail in these pages. The lamp this year will be somewhat reduced in price and will be fitted with a cowl in front and adjustable fasteners at the sides for a fork bracket, allowing the lamp to be tilted to any angle. Some motor cyclists still prefer a bell signal of alarm to a horn, and Seabrooks have introduced a loud sounding motor cycle bell, fitted with two rotating gongs. The Seabrook spanner is a well-known article among motor cycle riders, and three different types for motor cyclists are now sold, with a new non-rusting finish.

J. A. RYLEY, No. 231.

J. A. RYLEY, Martineau Street, Birmingham.—Among the great variety of motor cycle accessories on this stand, we particularly noticed a very nicely made tank, complete with gauges, oil pump, filter, etc. This firm has the agency for the K.E.W. magnetos. These have the mechanism well cased in, and are of a self-contained design, a particular point about them being the substantial construction of the contact breaker. The name J. A. Ryley has been long associated with the Vita sparking plugs, examples of which are on view. The J.A.R. siren, a very neat adjustable handle-bar mirror, solid leather toolbags, acetylene lamps, generators, oilcans, and collapsible funnels make up a comprehensive exhibit.

THE SPHINX MFG. CO., Bradford Street, Birmingham (No. 252).—The Sphinx Co. specialise in their well-known Sphinx plugs, which are made in a large variety of models and sizes, and are suitable for any engine. Their Gnat plug is probably the smallest practical plug manufactured.

THE HOFFMANN MFG. CO., LTD., Chelmsford, Essex (No. 276).—On this stand is exhibited a selection of the firm's well-known ball and roller bearings. A special feature is made of the latter type for motor cycle construction. Several ingenious working models are shown, proving the efficiency of these bearings.

Sphinx three-point plug.

R. BROADHURST, Smithford Street, Coventry (No. 216).—The above firm shows a large selection of motor cycle accessories. Among others the Polkey dynamo for lighting purposes, which is a most ingenious fitment. They show, of course, their lamps and generators, and specialise on a new model fitted with Mangin mirror lens and supported on a forked bracket. Special generator brackets for the top tube, and various kinds of horns are also staged.

LIFFE AND SONS, 20, Tudor Street, London, E.C. (No. 152).—our publishers—show at this stand standard works on subjects of interest to the motor cyclist, such as "Motor Cycles and How to Manage Them," "The Motor Cycle Route Book," "Hints and Tips for Motor Cyclists," maps, photographs, etc.

RENOLD CHAINS, No. 236.

HANS RENOLD, LTD., Brook Street, Manchester.—The new chain link connecting bar made by Messrs. Hans Renold has the one edge of the split catch turned up so that a screwdriver, when inserted between the two edges, will expand the joint and force it over the head of the rivet. While on this subject of chains, it will be as well to point out to those who are contemplating chain transmission for 1912, and have never used it previously, that under no circumstances should the number of teeth on the engine sprocket divide equally into the number of links on the chain. For example, if the engine sprocket have 16 teeth and the chain 48 links, every sixth revolution of the engine causes the stress of the explosion to come on the same roller with the result that it is very soon broken. It may not occur to every manufacturer that this is a little item to be avoided. The representative of Messrs. Hans Renold informed us that the firm's experts were recently puzzled over a case of broken chain rollers until they finally traced it to this cause. Needless to say, a very fine exhibition of chains is on view on this stand, including some extra strong roller chains for motor cycle work, while the models of motor cycle chain transmission are also most interesting.

New Renold split catch. A screwdriver is inserted at the turned up edge when the catch can be sprung over the rivet head.

UNION RUBBER AND CHEMICAL CO., Shaw Street, Ashton New Road, Manchester (No. 283).—Notable among the tyres and sundries displayed by this firm—repair bands, gaters, and inside plasters must be mentioned—are the retreads supplied for vulcanising to the foundations of worn covers. The repair outfits, too, are worth attention, and in this connection the experience of the firm has led them to substitute a screw-capped tin for the usual collapsible tube. Among the other very various necessities on this stand, the tins of Carbide deserve attention, also the "Lightning" patches; the former are made in suitable sizes for the rocket.

The Olympia Show.—

THE AUTOMOBILE ASSOCIATION AND MOTOR UNION, Whitcomb Street, Coventry Street, London (No. 162).—The A.A. and M.U., best known for their patrols, whose duty it is to give information, first-aid, and assistance to members, are showing specimens of their signs, etc.

H. VORLEY AND CO., LTD., St. Andrew's Works, Bethnal Green, E. (No. 148), have on view an assortment of oils, greases, etc.; also rubber solution and repair outfits. Among other novelties may be mentioned Vocol, a rubber solution which vulcanises itself, and Voco carbide and tyre paint.

KEMPSHALL, No. 161.

THE KEMPSHALL TYRE CO., LTD., I, Trafalgar Buildings, W.C.—A full assortment of Kempshall tyres are shown of the well-known anti-skid pattern. The tread of one type has been slightly modified for 1912, and a section of it was illustrated in a recent issue. It should be

Kempshall anti-skid tyre. Kempshall non-skid tyre.

remembered that the Kempshall Co. are the only firm that hold the R.A.C. certificate for the non-slipping properties of their tyres. The motor cycle tyres are made in the same way as the car tyres—that is to say, they are moulded to the proper shape from the commencement and the rubber is subjected to the enormous hydraulic pressure of four hundred tons.

THE MIDLAND RUBBER CO., LTD., Ryland Street, Birmingham (No. 30).—The Midland Rubber Co. specialise in rubber-studded and ribbed motor cycle tyres. These are strongly constructed and mounted on two or three layers of canvas. The company are prepared to guarantee these tyres for 3,000 miles. All the covers are manufactured with beaded edges, but a ribbed wired-on tyre is manufactured for lightweights. The firm also make a feature of the Midland belt. This is of the rubber and canvas type, and every belt is thoroughly tested before leaving the works.

STURMEY-ARCHER GEARS, LTD., Lenton, Nottingham.—As our last issue contained a full description of the Sturmey-Archer three-speed hub for motor cycles—the first illustrated description of its construction and method of working—it suffices now to say that the hub was shown whole and in detail, also built into a wheel and erected on a stand to show the method of operating the gear and clutch.

MICHELIN, No. 24.

THE MICHELIN TYRE CO., LTD., Chelsea, S.W.—A very large selection of motor cycle tyres is shown on the above stand, but no great alterations have been made as the existing types have given great satisfaction all round. The Michelin Co. manufacture a variety of treads, but specialise in the square tread and well-known steel-studded non-skid, which is famous for its excellent wearing properties. These tyres are manufactured both with beaded and wired edges.

RUSHMORE LAMPS, No. 191.

RUSHMORE LAMPS, LTD., Brewer Street, W. (No. 191), have an assortment of their lamps and generators, which were very fully dealt with in the issue of October 20th. The generator has a shaking grid, and as the firm is the originator of this type of lamp, motor cyclists may be sure they are getting a good article.

THE TORMO MFG. CO., Banhill Row, E.C. (No. 211).—The Tormo Mfg. Co. are showing the following types of Sarolea engines, all of which are provided with mechanically operated inlet valves and magneto ignition: 2 h.p., 66 x 72 mm.; 2½ h.p., 66 x 86 mm.; 3½ h.p., 85 x 88 mm. Also the F.S. ball bearings for motor cycle engines and gears, Tormo steel balls, and Eagle brand spokes and nipples.

PETER-UNION, No. 29.

THE PETER UNION TYRE CO., LTD., Great Portland Street, W.—The above company are showing three types of motor cycle tyres which have not been altered in any essentials. They consist of a steel-studded non-skid, a twin ribbed non-skid, and a plain tread. The company wish to draw particular attention to their puncture-proof band, which is formed by placing a separate rubber band between the tube and the cover. This should certainly tend to prevent many punctures. It will strengthen the tube against bursts and at the same time will not detract perceptibly from the resiliency of the tyre.

THE VILLIERS CO., Blakenhall, Wolverhampton (No. 275).—The Villiers Co. exhibit a very neat motor cycle hub clutch which is fitted to several well-known makes of motor cycles, among others the Singer, Matchless, and Alldays.

WEILL BROS., LTD., Hatton Garden, E.C. (No. 278).—One of the most striking novelties on this stand is a petrol funnel that is practically self-sealing—that is to say, as soon as the petrol level reaches the top of the tank, the liquid raises a valve that automatically prevents the entry of more, and so prevents unpleasant and dangerous overflow. It should have a big future. The firm are also showing a back rest for attachment to motor cycle saddles, and this by an ingenious arrangement can be lowered after giving it a slight pull upwards. In the horizontal position, moreover, this rest makes a useful luggage carrier.

C. BINKS, LTD., Phoenix Works, Eccles, Manchester (No. 139).—The new Binks carburettors were fully described in a recent issue. They are fitted for the pilot jet which gives strong slow pulling and easy starting. The control is by single lever which first opens the pilot jet, then the main jet, and when throttle is fully open a further movement of the lever uncovers the extra air ports.

The new Dover exonite pump, with foot-piece.

DOVER, LTD., Northampton (No. 264).—Tyre inflators of ample capacity for the larger sizes of motor cycle tyres and nice looking and substantial exonite handle grips. The firm are producing a bulb-ended grip which certainly looks as if it ought to be very comfortable in use.

P. AND H. LAMPS, No. 233.

PCWELL AND HANMER, LTD., Chester Street, Birmingham.—A very comprehensive exhibit of these well-known lamps is on view. Most of the examples are

P. & H. lamp, showing combination generator and lamp bracket and its fixings.

modelled on the lines of the car lamp, with separate generator, which can be carried, together with the lamp, on a bracket of neat design for securing to the steering head, the generator being secured to a single arm at the back of the bracket. Among these are examples of a larger pattern. These have Mangin mirror reflectors, projector lenses, a

2 h.p. 66 x 72 mm. Sarolea side valve engine.

burner adjustable for focus, and the angle of the lamp can also be varied. Besides lamps on these lines, the firm also show a head light, self-contained with generator, which follows somewhat the design of the cycle type of lamp.

The Olympia Show —

THE FORWARD CYCLE CO., Edmund Street, Birmingham (No. 95).—Adjustable and detachable Forward belt fasteners for ordinary types of belts as well as for Watawata belts. The well-designed For-

Forward detachable fastener, which has links of different lengths.

ward non-sooting plug is also shown. We may add that these accessories have met with much success during the past season.

CHAS. H. PUGH, LTD., Birmingham (No. 259).—On this stand the Senspray carburetter makes its first appearance at an exhibition. The great point about this device lies in the careful provision made for thoroughly atomising the petrol. The air, which is regulated by a shutter of the ventilator type, is hand-operated, and is led into the spraying chamber through a constricted tube, and in the centre of the passage way of this tube the jet emerges. As the air passage is constricted, the air has to flow through the tube at great velocity, and, meeting the petrol from the jet, it sprays it very thoroughly into the mixing chamber, whence the mixture is led past a balanced disc type of throttle to the engine. It has been recently illustrated in detail in these pages. The petrol level is more or less immaterial owing to the injector action of the air in the sprayer tube rushing over the jet. The method of attaching the carburetter to the induction pipe is certainly light and simple.

B. AND B. CARBURETTER, No. 277.

BROWN AND BARLOW, LTD., Witton, Birmingham. — This stand is full of interest, for many new developments are in evidence besides the single-jet carburetters which we know so well. A variable jet and choke type, known as the Universal model, is being introduced, and, in addition, a racing model with an extension pipe expanded at its end for the air supply. For lightweights both the single jet and variable jet with choke tube are supplied, one of the latter models being fitted with a detachable gauze screen at the auxiliary air inlet. Most of the carburetters are operated by Bowden wire mechanism, and are provided with cable and neatly designed levers complete for attaching to the handle-bars. Various types are also made for direct lever and connecting rod control. Some useful bends and pipe unions are also shown, besides the detachable dust screen, and complete sets of carburetter jets in cases. Motor cyclists, especially those interested in the tuning of their engines to topmost pitch, ought to peruse the firm's booklet, which contains some very useful hints on tuning up and valve timing.

F.R.S. LAMPS, No. 136.

S. HALL AND SON, LTD., Wrothesley Street, Birmingham.—The F.R.S. lamp, designed according to the specifications sent by motor cyclists and used with great success in the London-Exeter and back run last winter, is shown here in many patterns. These lamps have Mangin lenses and adjustable burners. A most important point, they open both front and back, and can be set up on their carriers in any position. Back rests and exhaust whistles are other features.

ASTON MOTOR ACCESSORIES CO., LTD., Aston, Birmingham (No. 254).—The well-known Amac carburetter hardly needs description, the principal features being multiple jets, a variable adapter worked by lever from the handle-bar; this cannot be entirely shut off, but reduces the passage to the minimum at starting and varies up to the maximum for running at full speed. The float chamber lid is secured by a spring catch which enables very rapid removal and attachment. The Amac firm is also exhibiting a useful little handle-bar cut-out switch, and a belt perforator which is practically a screw-operated pointed drift, which forces a hole through the belt without removing any material. This will particularly appeal to the users of rubber and canvas belts, for the resulting hole should certainly weaken the belt less than if punched out in the ordinary way. Also a very substantial belt fastener, machine made out of solid Ubas steel, is worth notice.

DUNHILL, No. 232.

ALFRED DUNHILL, LTD., Euston Road, N.W.—Amongst the "Dunwear" motor clothing, lined with camel fleece so as to be waterproof but ventilating, the overalls will particularly appeal to motor cyclists, while amongst the minor articles of clothing a very cheap woollen cravat, arranged without any troublesome fastening, deserves attention. So, too, especially do the caps, gloves, and leggings, all of which are of the firm's own manufacture. The accessories display is very interesting, including as it does, amongst other

Dunhill's "Dreadnought" Headlight with self-contained generator.

things, the "Wee Dreadnought" lamp for motor cycle work. This is a self-contained acetylene lamp on entirely novel lines, and is a very handsome little production. Another useful article is an effective canvas cycle cover, made in two qualities. This ought to be very useful at this time of the year to protect against dust and damp the machines of those motor cyclists who prefer to lay them up for the winter, for

it may save much work in the long run.

ELEPHANT CHEMICAL CO., Neate Street, Camberwell, S.E. (No. 274).—A full range of this firm's specialities—carbides, rubber solution, repair outfits, tyre patches, and metal polishes.

The College mud shield for winter riding exhibited by Beard-Brown on stand No. 261.

BIRMINGHAM SMALL ARMS CO., LTD., Small Heath, Birmingham (No. 234).—Besides the B.S.A. motor bicycle, examples of which are also shown in the body of the hall, and are described elsewhere, there is a display of motor cycle parts which is confined to the far end of the stand. Interesting sectional examples of the B.S.A. motor cycle free engine and two-speed gears are shown, and these, together with free wheel mechanisms and the B.S.A. engine complete and in its component parts, afford superb examples of the firm's workmanship. Besides these details, frame parts and spring front forks in their component parts are also on view.

PRECISION, No. 253.

F. E. BAKER, LTD., Newtown Row, Birmingham.—This exhibit is not confined to one stand, for a large number of machines in the Show are fitted with Precision engines. Generally speaking, the firm makes a point of supplying a complete power unit, fitted with magneto, carburetter, and all appurtenances. The $3\frac{1}{2}$ h.p. single-cylinder model, which, with a bore of 85 mm. and a stroke of 88 mm., comes within the 500 c.c. class, is but little altered. Various minor improvements are incorporated, as, for example, silent tappets have now been introduced. The same applies to the $4\frac{1}{2}$ h.p. single-cylinder engine, which has been designed to come within the 600 c.c. class, which has a bore and stroke of 89×96 mm. respectively. The little $2\frac{1}{2}$ h.p., which is a very pretty model, has a bore and stroke of 70×76 mm., 293 c.c., and weighs, without silencer, 36 lbs. The oil retaining qualities and other details in this model have been improved, while the large diameter valves and the exhaust pipe area should be noted. The new 5-6 h.p. twin, which has already been dealt with in *The Motor Cycle*, is attracting much attention. The firm is also supplying, complete with change-speed gear, a fine example of a $4\frac{1}{2}$ h.p. engine, fitted with a Bowden two-speed gear in a self-contained form, complete with bracket, for building into the frame, marking a very desirable combined power transmission unit.

The Olympia Show.—

MARKT AND CO., City Road, E.C. (No. 223).—Several examples of the Jones speedometer. The Jones was one of the earliest speedometers to be put on the market, and its makers have, in consequence, an extended experience in the construction of these instruments for motor cycle work. The chief features of the Jones are its accuracy, the steadiness of the hand, and its reliability and good wearing qualities. All models are fitted with trip recorder and instantaneous reset.

S. SMITH AND SON, LTD., Strand, London (No. 265).—The well-known Smith

S. Smith & Son's lamp and generator set, carried on a single bracket.

speedometers, which register, as a general thing, up to sixty miles an hour, and combine, with the measurements of speed, a distance recorder. Some of the models shown are fitted with a trip recorder for registering the day's mileage. One is fitted on the Singer motor bicycle,

S. Smith & Son's handle-bar mirror with universal joint.

Perfect sparking plugs, which are a special product of this firm.

BOSCH IGNITION, No. 284.

BOSCH MAGNETO CO., LTD., Newman Street, Oxford Street, W.—The new enclosed Bosch magneto appeals particularly to motor cyclists whose engines are necessarily exposed to the vicissitudes of the weather. It is a most interesting little machine, with all the working parts completely encased, but having protected lubricating holes accessibly placed. The high tension cables are fitted with watertight connections, which are accessible without recourse to tools; distributor and contact breaker can also be easily examined. The principle of the bayonet joint assisted by a spring is used for the casing of the latter. In the very latest design the poles have been extended somewhat round the

circumference of the armature, with the result that starting is easier with a retarded spark. A new type for use with two plugs in one cylinder is also shown. This is the Z.E.I. type. In this the high tension current is conducted to two distributors, each one leading to its separate sparking plug. As the combustion from two sparks is naturally more rapid, we understand that the timing in this two-spark type can be 15° later than in the ordinary single plug pattern, whilst it is also claimed that the more complete combustion gives an increase of 10% more power. The Bosch Company are showing a new sparking plug terminal with watertight cover.

BROWN BROS., LTD., Great Eastern Street, E.C. (No. 207).—This firm has always been noted for its accessories, and a glittering array of lamps and generators of various designs, mirrors, horns, and oilcans attract attention. The Auto-clipse lamp is a speciality of this firm, whilst a new pattern Powell and Hammer self-contained lamp and generator should be inspected. Tyres will receive special attention by Brown Bros. in 1912. Various designs of toolbags for the rear of the carrier or to carry pannier fashion are among the exhibits. A new two-speed counter-shaft gear Brown motor cycle with sidcar completes the exhibit. We deal with this among the motor bicycles at the Show. Brown Bros., Ltd., make a speciality of motor cycle tyres. Of these the most interesting is the model X type, the tread of which is provided with two ribs, and between these are lozenge shaped projections which alternate with studs.

THE SERVICE CO., LTD., 111 High Holborn, W.C. (No. 292).—Many accessories, which were described in detail on page 1180 in our issue of November 9th, such as the Service "Warbler," the ingenious "Fitzall" spanner, the "Voltalite" electric lighting set, the Binks, C.A.P., Lukin, and other well-known carburettors, the A.L. generator, Service belt, and other numerous and useful accessories. The firm's clothing exhibit is also worth a special visit. The approaching cold weather will cause the motor cycle rider to take interest in the several warm reefer jackets sold by this firm, while the prevalence of wet in the winter months will evince a similar interest in the oil skin overall suit of which the Service Co.

Ingenious design of rubber-studded belt sold by the Service Co.

make a speciality. Similar to the oil skin is a suit made of Pegamoid, which is of pleasing appearance and is well spoken of by all who have used it. Gloves, caps, comforters, and other items which add to the warmth, welfare, and comfort of the rider are also to be seen here.

THE MICROMETER FREE WHEEL CO., Spon Street, Coventry (No. 295).—A varied selection of micrometer free wheels for motor cycles of all types.

F.R.S. LAMPS AND GENERATORS, No. 136.

S. HALL AND SONS, Wrotesley Street, Birmingham.—It is interesting to remind our readers that these lamps are built upon suggestions received from readers of *The Motor Cycle* some years ago. The excellence of their light-giving properties is too well known to be dwelt on further. The F.R.S. grid generator is worthy of close inspection.

The Vevo foot and hand operated pump.

FRANKLIN, 72, Regent Street (No. 51).—This exhibit is of interest to short-sighted motor cyclists, as Messrs. Franklin make a speciality of goggles fitted with lenses to suit the sight.

A.B.C. MFG. CO., Cannon Street, Birmingham (No. 19).—Motor cycle lamps fitted with genuine Mangin lens mirrors. One of these is shown with black finish, and the black is guaranteed not to chip or come off. The A.B.C. generator works on the drip principle, and is provided with an automatic valve to blow off when the pressure gets too high. A special clip is provided to the generator for attaching to the top tube, made in two halves and bolted together. Also the Anti-rust semi rim is shown. This consists of two curved rings with serrated edges, made of aluminium alloy, which fit over the edge of the edges of the tyre rim. The serrated edge stops creeping of the tyre, and at the same time rust is kept out and the bead of the tyre is prevented from cracking.

New pattern Stanley hook with square ends.

THE COVENTRY RUBBER CO., Spon Street, Coventry (No. 296).—Three Spires non-skid motor cycle tyre. This cover remains unaltered for 1912, as the manufacturers have found its wearing and non-skid qualities all that can be desired.

G. ATKINSON, Summer Hill Row, Birmingham (No. 47).—Two types of motor cycle covers, the rubber-studded heavy non-skid specially constructed for high-powered machines, and built of three-ply Egyptian canvas, and known as the Wimbourne. Also a lightweight motor cycle cover with corrugated tread, the Wimbourne red Para butted tube, and the Brooklands rubber belt. Also gas tubing, fibre brake blocks, patches, and repair outfits.

THE COUNTY CHEMICAL CO., LTD., Bradford Street, Birmingham (No. 293).—Chief novelties are chemical puncture stopping, a liquid inserted in the tube which seals the puncture, and is claimed to have no effect upon patches. Chemico Reliance repair outfits are now provided

The Olympia Show.—

with a stiff-backed patch, a patch stuck to cardboard so that it can be easily manipulated and put on. When the patch is properly stuck the cardboard can be pulled off. Also the noiseless repair outfit; the outer covering is corduroy, and envelops a spring. There is a separate compartment for each article, and when rolled up the spring holds the whole in position. The Chemico backrest appeals to those who cover long distances. Besides the above, an ingenious ratchet valve grinder is shown supplied with ratchet screwdriver and lever. The lever is hooked at one end, this hook being placed under the tube of the frame, allowing the requisite pressure to be put on the valve. Oil for air-cooled engines, car-bide, enamel, metal polishes, etc.

THE MECCA OF MOTORISTS.

Though not showing at the Olympia Show, Messrs. Gamage will have several novelties on view at their Holborn

Kerry "Ideal" tyre.

depot, which may be described as "The Mecca of Motorists." Among the motor cycle specialities may be mentioned Dr. Stormont's mudshield, which is made of

leather and extends from the head at right angles to the frame right down to the ground. It is of ample width, so as to ensure perfect protection to the rider, while a hole is suitably placed for allowing the air to reach the engine. Gamage are now marketing a motor cycle.

We were also shown during a recent visit to this emporium a very complete and useful tool roll for motor cyclists, put up in a water-proof canvas case. Mascots are popular among a number of motor cycle riders, and Messrs. Gamage sell one of these in the shape of the well-known Lincoln Imp, designed to be clipped on to the handle-bars.

In the clothing line also novelties are to be found, among which may be mentioned a suit of overshoes and leggings, which afford protection from the feet almost to the waist. Every accessory and article of clothing that a motor cyclist wants, or is likely to want, can be seen in the well equipped showrooms of this well-known firm.

THE MOTOR CYCLE IN THE UNITED STATES.

HAVING recently made a short visit to the North-eastern corner of the United States of America, I have been asked by the Editor to give some of my impressions concerning the state of motor cycling in America. Having been a reader of some of the American periodicals for some years, I must confess that my first impression was one of considerable disappointment. I landed in New York, and had been there several days before I saw a motor bicycle at all, and my wanderings took me not only up and down the busy streets of the town, but into several of the outlying suburbs.

In England one would not expect to see many motor cycles actually in the City, but it would scarcely be possible to spend an hour anywhere in a circle five miles from St. Paul's without encountering many machines of different kinds.

Riding Conditions in New York.

Also, New York is in many ways far better suited to motor cycling than is London. The streets are wider, the traffic is much less dense, and the distances between important points of the town are fairly great. On the other hand, with one or two noticeable exceptions, the condition of the streets is such that riding in any kind of vehicle is extremely uncomfortable, and riding on any sort of bicycle might become positively dangerous. Although a number of pedal cycles are in use, there is nothing like the same proportion as anywhere in England. The utility of every kind of cycle in America has been so greatly reduced by the truly abominable roads that cycling and motor cycling have never become part of the national life in the way they have here.

In some of the smaller towns such as Buffalo, Cleveland, Dayton, Ohio, and, of course, Detroit, a good many motor bicycles are to be found, but although I covered a good many hundreds of miles of the roads lying round these cities, I do not think that I actually met fifty motor bicycles in the whole time, although cars were encountered every few miles. Here, too, of course, the roads make motor cycling a quite violent physical exercise.

Driving a car on roads which in most parts of Europe we should disdain to call cattle tracks is sufficiently hard work for most people, and motor cycling must be infinitely more strenuous.

The Alleged Roads of the U.S.

Imagine a track some thirty feet wide consisting of loose earth, either sand or clay, according to the nature of the soil, and rutted by the passage of cars and farm waggons often to a depth of a foot in dry weather, and much more in wet. Rarely is any attempt made to level these roads, the usual method of repairing being to scrape up from the sides towards the centre, perhaps adding a little gravel until

there is a ridge along the middle of the road three or four feet high. This is left to be trampled and scattered about by passing traffic, and one is liable to come upon twenty mile stretches of this sort of thing.

The only occasion I had for observing the pastime in the country at really close quarters was on a short run near Dayton, Ohio, over a medium quality road. On this occasion a fairly large party were going out to see some flying at the Wright Bros.' ground, about eight miles from the city, and as I was travelling in a car I was able to appreciate the sensations of half a dozen Indian riders who "hung on" for most of the way.

At speeds above twenty miles an hour they appeared never to touch their saddles at all, and in order to avoid ruts, the steering consisted of a series of plunges from side to side of the road. Several times they dismounted to negotiate a particularly deep patch of loose sand, and often in rising over a hump in the road the whole machine would leave the ground for a foot or two coming down with a "whack" which made one wonder how the frames could stand the continual strain.

A Big Future for American Makers.

Undoubtedly the roads of America are improving rapidly, because it seems that nearly everyone who can possibly afford any sort of motor is buying one, and as soon as the roads are good the convenience of a motor cycle in covering the long distances from town to town cannot fail to bring it to its own.

Machines are used to a considerable extent by the urban governments for the speedy transport of police and fire brigade officials, and frequently it seems the use of a motor bicycle has enabled the capture of a criminal or assisted in the extinction of a conflagration when no other means would have served.

If the rider is not considering his comfort the two-wheeled machine can, of course, be taken into places where no car could go, and usually at a speed which no horse could attain. It seems to me that the employment of motor cycles by the local government bodies in America is likely to be a most powerful influence in the betterment of American roads—certainly no official who rides a machine can be under any illusions concerning them.

A.L.C.

Yeovil and District M.C.C.

The annual general meeting was held on the 8th inst. at the Half Moon Hotel. The following officers were elected: President, Dr. R. H. Walters; hon. treasurer, Mr. W. R. Waterman; hon. sec., Mr. J. Baker. The club team were congratulated on their winning the silver cup in the A.C.U. Six Days' Trials in Yorkshire.

NEW LONG DISTANCE RECORDS.

ON the 14th inst., J. R. Haswell, the well-known private owner of a $3\frac{1}{2}$ h.p. T.T. Triumph motor cycle, put up a splendid performance at Brooklands. The day was windy, and by no means favourable for record-breaking. Haswell's machine ran consistently, and there was little difference between the fastest and slowest lap. The fastest lap was 2m. 34s., making a speed of 63.53 miles per hour, while the slowest lap was 2m. 41s., giving a speed of 60.77 m.p.h. While he was running he never covered a lap at less than 60 m.p.h., but unfortunately he had very bad luck, having stops of 23m., 10m., 5m., 6m., and 5m. respectively, due to valve trouble and to the attachment of the special silencer, fitted to comply with the Brooklands regulations, coming loose. As a silencer, the device was distinctly a success, though of somewhat bulky dimensions. Despite this, however, he captured the

four, five, and six hour records and 250 and 300 miles, the complete figures being:

4 hours: 209 miles 420 yards.

5 hours: 266 miles 584 yards.

6 hours: 321 miles 1,060 yards.

250 miles: 4h. 42m. 43 $\frac{2}{5}$ s.

300 miles: 5h. 38m. 56 $\frac{3}{5}$ s.

These are world's records in Classes C (500 c.c.), D (750 c.c.), and E (1,000 c.c.).

The rear wheel was changed as a precaution, though the tyre was in quite good order. If it had not been for the troubles he experienced, Haswell might well have averaged sixty miles throughout the whole ride—certainly a marvellous performance. As it was, Haswell was exceedingly disappointed with the ill-luck which dogged him, and decided to stay on the track with a view to improving his short-distance times and distances.

Manufacturers' Union Second Annual Banquet.

THIS function was held at the Waldorf Hotel on Friday last. Mr. Arthur Brampton, J.P., president of the Union, presided. After an excellent dinner, the Chairman proposed the toast of the Sovereign in the old-fashioned way, raising his glass to the "King across the water." In proposing the toast of "The Manufacturers' Union," he apologised for its lengthy title, which had been imposed on them by a Government department, but what was in a name? The Union, which was but three years old, had been of great service to the trade. Mr. Alfred Bednell, the secretary, had proved himself to be invaluable. He was as wise as a serpent, and yet not quite as harmless as a dove. The great work of the Union had been the Show; in fact, the Union and the Show were inseparable.

Mr. S. Bettmann, J.P., in reply, spoke at some length on the work the Union had done.

Mr. H. G. Burford, also in reply, made a capital speech, and was the only speaker who gave the motor cycle side of the Union's work more than a passing reference. The Show, he said, was essentially a motor cycle show, and was the finest exhibition of its kind in the world. He was pleased to see that the

British motor cycle still more than held its own. He spoke in glowing terms of the excellent work done by Mr. Bednell, the secretary, and Mr. C. D. Clayton, the press agent.

Mr. Chas. Marston, ex-president of the Union, then proposed the toast of "The Guests," making special mention of the press.

Mr. Massac Buist (the *Morning Post*) replied, and referred to his fellow guests, Messrs. Robert Todd (chairman A.C.U.), F. Straight (secretary A.C.U.), Stenson Cooke (secretary A.A. and M.U.), A. Blackie (manager of the Olympia Show), and T. Woodfine (secretary the S.M.M.T.)

Mr. J. Percy, J.P., replied on behalf of the technical press.

Mr. Harry Smith, a vice-president of the Union, proposed the toast of "The Chairman."

An excellent musical entertainment followed.

A disappointing note in the speeches was the manner in which the motor cycle industry was slurred over. It is true that every speaker made once during his speech a casual reference to the movement, but with the exception of Mr. Burford everyone practically ignored the subject.

ADDENDA TO BUYERS' GUIDE.

A number of specifications of 1912 models have reached us since "The Buyers' Guide" went to press. Brough (Ladies').— $3\frac{1}{2}$ h.p., 85 × 88, Brough variable gear, belt, height 29in., wheelbase 49in., Continental tyres 2 $\frac{1}{2}$ in. £52 10s.

2 $\frac{3}{4}$ h.p., 77 × 88, Brough variable gear. £50.

C.C.R. (Twin).—4 $\frac{1}{2}$ h.p., m.o. valves, 70 × 80, belt, wheelbase 52in., Dunlop 2 $\frac{1}{2}$ in., weight 180 lbs. £50. F.E. hub £6 6s., and Armstrong three-speed £10 10s. extra.

C.C.R. (Sidecar).—8 h.p. J.A.P., 85 × 85, three-speed and clutch, Dunlop 2 $\frac{1}{2}$ in., wheelbase 62in., weight 280 lbs. £78 15s.

Dor.— $3\frac{1}{2}$ h.p. Precision, 85 × 88, Amac, V.S. hub, belt 2 $\frac{1}{2}$ in., height 29in., clearance 4 $\frac{1}{2}$ in., Hutchinson 2 $\frac{1}{2}$ in., weight 190 lbs. £57 15s.

Dor (Twin).—8 h.p. J.A.P., 85 × 85, Amac, V.S. hub, same dimensions, weight 210 lbs., 2 $\frac{1}{2}$ in. tyres. £68 5s.

6 h.p. J.A.P., 76 × 85, Amac, V.S. hub, weight 200 lbs. £67 4s. Without V.S. hub £10 10s. less.

Edo.— $3\frac{1}{2}$ h.p. Precision, 85 × 88, B. and B., belt, height 30in., clearance 5in., Dunlop 2 $\frac{1}{2}$ in., wheelbase 53 $\frac{1}{2}$ in., weight 160 lbs. £42.

4 $\frac{1}{2}$ h.p. Precision, 89 × 96, Amac, P. and M. two-speed, chains, height 31in., clearance 3in., Moseley 2 $\frac{1}{2}$ in., wheelbase 55 $\frac{1}{2}$ in., weight 180 lbs. £56.

LINCOLN ELK.— $3\frac{1}{2}$ h.p., 85 × 88, B. and B., belt, height 32in., clearance 4 $\frac{1}{2}$ in., Palmer 2 $\frac{1}{2}$ in., wheelbase 53in., weight 180 lbs. £34.

3 h.p., 79 × 82, weight 150 lbs. £30 10s.

2 $\frac{1}{2}$ h.p., 70 × 72, height 30 $\frac{1}{2}$ in., wheelbase 49 $\frac{1}{2}$ in., weight 120 lbs. £28 10s.

MOTOSACOCHE.—The lady's machine has a 2 h.p. 62 × 70, not a 2 $\frac{1}{2}$ h.p. engine, a spring frame, and weighs 95 lbs.

SERVICE (Twin).—8 h.p. J.A.P., 85 × 85, B. and B., Roc two-speed, Service belt, tyres 2 $\frac{1}{2}$ in.

SERVICE (Single).— $3\frac{1}{2}$ h.p. J.A.P., 85.5 × 85, B. and B., Service belt.

CURRENT

CHAT

TIME TO LIGHT LAMPS.

" 25th	4.57 p.m.
" 27th	4.55 p.m.
" 29th	4.53 p.m.

65,000 Copies of "The Motor Cycle."

The circulation of the issue of *The Motor Cycle* dated November 9th was 63,250 copies, and of the second show number, dated November 16th, 65,000 copies.

Late Club Items.

The annual reliability trial of the Sutton Coldfield A.C. will take place on December 14th and 17th.

There will be a meeting at 8.30 p.m. on the 29th inst. at the Royal Talbot Hotel, Victoria Street, Bristol, to discuss the desirability of forming a purely motor club for Bristol and the neighbourhood.

The Show Catalogue.

A word of praise is due to those who are responsible for the compilation of the Show catalogue. In it are alphabetical lists of all proprietary names in the allied industries, as well as a complete list of exhibitors with their postal and telegraphic addresses, cable codes used, and telephone numbers. The whole is arranged in a convenient style and sold at 6d.

Cut-outs to be Prohibited.

The Local Government Board has written to the Royal Automobile Club stating that the Board has under consideration the question of the use of "cut-outs" on motor vehicles, and proposes to take steps to prohibit the use of these fittings on the public highways. This ban will seriously affect both motor cyclists and manufacturers of motor cycles, the former because they nearly all possess machines that are fitted with cut-outs, and the latter because they will be compelled, in many cases, to redesign their silencers. In the long run the Local Government Board's decision will benefit the pastime, and it is surprising it has not come about before.

The Olympia Press View.

It was somewhat of a farce to apply the term "press view" to Olympia last Saturday. The majority of the exhibitors were far from ready, whilst some stands were deserted. The management are hardly to blame in a way, as some delay was caused through the close proximity of the Car Show. We understand the car exhibits were not all out on the Wednesday of last week, so the motor cycles could hardly shake down by Saturday. There were also complaints of delay on the railways. If we are to have a press view it ought to be complete. Two of the most novel machines were not brought into the Show until Saturday afternoon. The James and Matchless stands were even deserted until Sunday midday, whilst on Sunday evening the Show was by no means complete.

Advance Reports.

One or two writers of motor cycle notes in the daily papers last week referred to the "display" of four-wheeled runabouts at Olympia, and called this type one of the attractions of the Show. This comes of publishing advance reports.

The Show on the Opening Day.

The Show opened at 10 a.m. on Monday. All night work resulted in every stand of importance being filled on Monday at opening time. Most stands in the Main Hall were lighted, and a general view from the Gallery was distinctly pleasing. People were not exactly fighting to enter at 10 a.m., but later on the building was receiving an ever-increasing stream of visitors. The morning was dull and cold, and later rain began to fall.

SPECIAL FEATURES.

OLYMPIA SHOW REPORT.
PROFUSELY ILLUSTRATED.

SIX YEARS OF MOTOR CYCLING.

BY MRS. M. C. COOKE.

M.C.C. SECOND WINNER RUN.

Brooklands.

Records at Brooklands are most sought after at show time, consequently it was not surprising to find a small host of well-known riders on record bent at Brooklands last Saturday. The morning opened fine, but a drizzle soon gave place to pouring rain, and records through seas of water were, of course, impossible. Among those who are waiting attempts on record are J. R. Haswell, who is not satisfied with his last week's performance, and thinks with better luck he will improve his times; Rhys on a Rudge; Lieut. Smith, R.N., $3\frac{1}{2}$ h.p. Singer; G. E. Stanley, $2\frac{1}{2}$ h.p. Singer; and W. H. Bashall on a Bat sidecar. Another rider in attendance is the hour record-holder, Stanhope Spencer, who is merely waiting at Brooklands with his racer watching the fun. He tells us that in case his distance for the hour is beaten he will immediately attempt to improve upon the new times. He considers he could add two miles to his distance in the hour. Most if not all of the above-named riders will attempt record this week at Brooklands, as also Harry Martin. F. A. MacNab is having a water-cooled cylinder made for his $3\frac{1}{2}$ h.p. Trump-Jap, and is confident that improved speed will result.

A photographic denial of the numerous statements that there are no four-wheeled vehicles at Olympia! It is a Humber railway trolley, propelled by a 2 h.p. lightweight engine set.

A.C.U. Sub-committee.

The above committee is now busily engaged in looking after the wants of motor cyclists on the road, especially as regards the appointment of suitable hotels and repairers. A capital sign, bearing the A.C.U. initials, has been ordered, and certificates have been got out for the repairers.

The Show.

Special trips to Olympia from all parts of the country have been arranged. On Saturday there will be a big influx of visitors from the provinces. The Wolverhampton M.C.C. has arranged for a saloon to be attached to the L. and N.W. 5.50 a.m. train, and other organised outings will start from Birmingham and Coventry.

Activity in the Midlands.

Next year the Coventry and Warwickshire Motor Club will organise an open reliability trial in the spring, in addition to the autumn open hill-climb. Another novel event on the draft programme is a winter run on the last Saturday of the current year.

Meeting of Club Secretaries.

On Saturday evening next, in the Press Room at the Cycle and Motor Show at Olympia, secretaries of motor cycle clubs will meet for the purpose of arranging dates for the 1912 fixtures in order to avoid clashing of dates. At the conclusion of the meeting it is proposed to discuss the question of the relationship between the Auto Cycle Union and the provincial clubs.

Slow Moving Traffic.

Representations have been made by the R.A.C. to the Commissioner of Police for the Metropolis urging him to take steps to regulate the traffic in Tottenham and Wool Green with the object of keeping the slow moving vehicles near the left kerb. As a result the secretary has been informed that Sir Edward Henry will direct such special action as may be necessary.

Motor Cycle Famine in Ceylon.

The boom in motor cycles which set in in England two years ago has now reached Ceylon. All the motor cycles imported are bought up at once, and many more could be sold if they could be delivered. One Colombo firm (Messrs. Brown and Co.) has sold seventy-three motor cycles this year. The majority of the buyers find the machines very handy for getting about. A Ceylon M.C.C. has now been formed, and the members already number sixty.

A Colossal Output.

Mr. Howard E. Coffin, past president of the American Society of Automobile Engineers, read a paper at the Institute of Mechanical Engineers, Storey's Gate, S.W., on Wednesday, November 8th. In replying to the discussion, Mr. Howard Coffin stated that the total out-put of one American factory would amount to no less than 75,000 motors cars in twelve months. The Chairman of the meeting then drew a comparison with the total out-put of the motor car firms in this country and said that the above figures gave a ratio of two to one in favour of the single American firm.

FUTURE EVENTS

Nov. 20-25.—MOTOR CYCLE AND CYCLE EXHIBITION AT OLYMPIA.

Dec. 9.—M.C.C. Annual Dinner at the Café Monaco.

" 26-27—M.C.C. Winter Reliability Run to Exeter and back.

" 27—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

Another Winter Trial.

The Bradford Motor Cycle Club proposes to organise an open twenty-four hour reliability trial to Barnet and back on New Year's Day.

R.I.A. Activities.

A meeting of the Midland Centre was held on the 8th inst. Local road improvements were dealt with, and the proposal to construct a new road from Birmingham to Wolverhampton was again considered. Also the question of lighting unrolled metal at night was dealt with.

Direction Signs in Kingston.

A short time ago the R.A.C. secured the erection of a lamp on a dangerous unlighted barrier on the blind end of Lingfield Avenue, Kingston-on-Thames. Permission has now been obtained for the erection of a conspicuous direction sign, which, it is hoped, will be fixed in a few days.

A Delicate Situation.

The members of the committee of a club on Merseyside are going to have a rare chance of showing their British good sportsmanship. They have been competitors for a cup presented for the "best performance of the year," and there is diversity of opinion about the donor's intentions. Farcy committee members who have been competitors trying to decide to whom the cup shall go! It is an awkward situation, and we hope for a happy settlement.

Affiliation.

The Ipswich and District Motor Cycle Club (thirty-two members) has become affiliated to the governing body.

A.C.U. Metropolitan Centre.

Mr. P. D. Stirling, hon. secretary of the Metropolitan Centre of the A.C.U., talks of organising a smoking concert for members of clubs affiliated to the centre in January next.

Winter Hill-climb in France.

The Auto Cycle Club of France is organising a hill-climbing competition for motor bicycles, tricars, and voiturettes to be held December 17th. All machines except in two open classes must be of the commercial type, i.e., "rigorously in accordance with makers' catalogue specification." Manufacturers' entries are confined to three machines in each class.

Motor Bicycles.—Class 1, 225 c.c.; 2, 300 c.c.; 3, 400 c.c.; 4, 500 c.c.; 5, no restrictions.

Tricars.—Class 1, maximum bore of engine 90 mm.; 2, no restrictions.

Entrance fees for motor bicycles, 15 francs; tricars, 20 francs.

The address of the secretary of the French Auto Cycle Club is 35, Rue de Crussol, Paris.

Military Motor Cycling.

It will be remembered that some time ago the Auto Cycle Union submitted to the Army Council a scheme for the provision of a number of motor cyclists for service in cases of emergency. Nothing much has since been heard of the matter, but an Advisory Committee, consisting of representatives of the War Office, the Auto Cycle Union, and the Automobile Association, has held many meetings to draft a scheme likely to be acceptable. This scheme has now been completed, and as soon as finally approved by the Army Council it will be published.

A.C.U. Quarterly Trials.

The Bradford M.C.C. has made the following proposition: "That, as an encouragement to Quarterly Trial entrants every rider in any trial making a non stop run be awarded a medal, silver suggested." This was referred to the A.C.U. Competitions Sub-committee for its consideration.

AT OLYMPIA. Water-cooled 4 h.p. Rex with two-speed gear in back hub.

AUTO CYCLE UNION NOTES.

OWING to the Union having decided to grant permits to provincial clubs to hold open competitions, provided the rules given hereunder be observed, and with the intention of starting the new year with as few suspensions on its books as possible, the following suspensions have been removed:

Removal of Suspensions.

Riders who took part in the Northern League competitions in 1910 and 1911 and the Liverpool A.C.C. trial held this year, to date from January 1st, 1912. It has also been decided to remove the ban placed upon the Harrogate and Scarborough clubs.

Messrs. Ivan B. Hart-Davies and Hugh Gibson, both riders who were suspended for taking part in road records in which the legal speed was exceeded, will also be reinstated.

Open Reliability Trial.

It has been decided that permits should be granted to clubs to hold open reliability trials upon the following conditions:

MINIMUM DISTANCE.—That the minimum distance be 100 miles.

SPEED.—That the schedule time shall not be set above the legal limit.

CUT-OUTS.—That cut-outs be not used, and if fitted they must be sealed. The judges shall have power to disqualify noisy machines.

SUNDAY COMPETITIONS.—That no competition or part of a competition shall extend over a Sunday.

ROUTE.—That a permit be not granted in the case of a course traversing a populous district more than twice, and that the course be arranged so as to cause the least possible inconvenience to the public.

SILENCERS.

THE article on silencers in the last issue must have been read with great interest by peace-loving motor cyclists. I should like to make a few further remarks upon a subject which is of great importance, and likely to come much to the front in the future, probably in the near future. It is generally recognised that a silencer has two functions to perform: (1) To silence the exhaust; (2) to admit

if the silencer be properly designed and the exhaust pipe of a suitable length, the gas in the pipe will be already in motion, and will have caused a partial vacuum in the pipe itself which will assist the gases to escape from the engine and at the same time issue from the silencer into the air with a much lower velocity, and consequently with less disturbance of the atmosphere and less noise.

Continuous Escape of Gas desirable.

Another point is that a silencer should cause the gases to issue from it more or less continuously, and not so much in jerks or separate explosions. The gas should have some opportunity of expanding before it gets into the air; hence a small exhaust tube will not prevent noise, though a large one will to a considerable extent, even without a silencer on the end of it. The accompanying design shows a silencer which should be fairly efficient.

AURIGA.

of the escape of the gases without causing back pressure. An improperly designed silencer, which gives silence at the cost of back pressure, not only results in a considerable loss of power, but adds to the cost of motor cycling in the unnecessary waste in the consumption of petrol and lubricating oil, not to mention the harm done to the valves caused by engine overheating. So far so good, but to my mind this is not all, and I contend that a perfectly efficient silencer will not only cause no back pressure, but will actually have an opposite effect, and by means of utilising the inertia of the gases in the exhaust pipe (which I regard as part of the silencer) will actively assist in the removal of the used gas from the cylinder, provided that the valve timing is also correct, which means that a certain amount of overlap must be allowed. To get rid of the burnt gases quickly not only means an immediate reduction of pressure on the piston during the exhaust stroke, but that a bigger volume of gas enters on the succeeding stroke, the charge assuming a pressure nearing atmospheric.

If an engine exhausts straight into the open air, the exhaust gases have to displace a certain amount of air, which is more or less in a state of rest; this in itself is sufficient to cause some back pressure. The same is true when a silencer is used, but in this case,

THE MOTOR CYCLE IN THE ANTIPODES.

A kangaroo and a cockatoo keep their master company whilst he effects adjustments to his Kerry-Abingdon.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C. and should be accompanied by the writer's full name and address.

Large Twins v. T.T. Singles.

[6063].—I have read with great interest Mr. Bashall's letter on the above subject, and note what he says about the big Matchless. He has been seen driving the big machine through Ripley lately, and I should say that it was very far from being as quiet as a lamb.

I have heard rumours of a certain motor cyclist in the same neighbourhood being held up four times in a week for driving to the danger of the public. Is the big 8 h.p. steady in grease, as some of the T.T. singles are absolutely unrideable in the wet weather and grease that we have been suffering from here (Birmingham district) lately.

GEO. WILLOUGHBY.

Magneto Position for the Colonies and Other Items.

[6064].—Some two or three months ago I sent you my idea for a suitable motor cycle for this locality which you were good enough to publish, and I can add nothing more to that except that since then we have found that the magneto fitted close up to the rear of the cylinder is not at all suitable for our hot climate. What with the heat of the cylinder and our 110° in shade, and being sheltered from the cooling breeze instances have occurred of the melting of the insulation in the magnetos. A 5in. engine clearance, a trifle longer wheelbase, much heavier rims, 2½in. tyres, and handle-bars of 16 G. tube should be universal.

Adelaide.

AUSTRAL MOTORIST.

Hills in the Macclesfield District.

[6065].—With reference to Mr. Burgess's letter [6024], I can fully endorse his remarks as to the severity of the hills in the Macclesfield district. It would be interesting to see some of the hills between Macclesfield and Clulow Cross or Swythamley included in one of the two one-day trials to be held next year, and also to hear the riders' comments on them.

O.M.G.

[6066].—I see from Mr. Burgess's letter that he wants to hear of other people's experiences in the hilly part of Cheshire. I may say that I know the district on the Wincle and Wildboardclough side of Macclesfield, and have climbed all the steepest hills on my 3½ h.p. Zenith-Gradua. Does Mr. Burgess know the hill at Swythamley Park, on the old road between Leek and Danebridge? There is a very sharp left hand hairpin bend close to the bottom of the hill which I imagine would cause most 3½ h.p. single-gear machines to yield up the ghost on the 1 in 4 gradient just round the bend, even though the surface is fairly good.

I have twice climbed it on my Zenith, both times with a hot engine, the Gradua gear enabling me to pick up easily again round the hairpin. This is only one of the many steep hills with which the district abounds, but I don't think that any of them are beyond the powers of a good 3½ h.p. variably-gear machine. I wonder if Mr. Hugh Gibson knows the district? It would make quite a happy hunting ground for his Bradbury and sidcar.

I don't know the hills round Kettleshulme and Rainow, but hope to try them at the first opportunity.

In his letter Mr. Burgess omits to say whether his Bradbury has two speeds. Also I should like to know if he managed to get up all the hills in the district. From the tone of his letter I infer that he did not.

J. C. RAILTON.

Lubrication of Twin-cylinder Engines.

[6067].—There is a question which I would like to see definitely settled about twin-cylinder engines, and that is the lubrication. From what I can make out from the majority of twin riders they say one cylinder gets too much oil, whilst the other is starved for want of oil, and if this is true it must greatly detract from the efficiency of a twin. Having only ridden a single, I have had no experience of the question I have put, and as I am thinking of riding a twin next year, I, naturally, would like to know the truth of this matter. No doubt others who are thinking of going in for a twin may have heard the same, and will hesitate until they know for a fact whether the lubrication is effective in both cylinders. If not, one cylinder must wear quicker than the other, which means £ s. d.

C. B. ROBINSON.

Adjustable Tappets.

[6068].—I recently saw on a friend's machine a rather good idea which will no doubt be of interest to some readers. As most motor cyclists know, after a few hundred miles the clearance between the end of the valve stem and the head of the tappet gets wider through the continual hammering, and causes a loss of power due to the valves not lifting to the proper extent.

Adjustable tappet illustrating letter from G.R.T.

As the correct clearance is equal to the thickness of a visiting card when the engine is hot, it is sometimes a rather difficult matter to find a means of lengthening the valve stem on the tappet in order to make up for wear that has taken place. Many try brazing a piece of steel on to the end of the valve stem, and others fit a steel cap over the tappet, but I think the following idea is quite

as good, easy to make, and very satisfactory.

Taking, for example, the Triumph tappet, the procedure is as follows: The next time the cylinder is taken off for the purpose of cleaning off the carbon deposit the tappets are removed and taken to the nearest motor or cycle mechanics' shop, where about ⅛in. is filed off the lower end of the tappet rods. A small hole about ⅛in. in circumference is then drilled in the centre of the head of each tappet about ¼in. deep and a round pin of steel is driven into this hole. The pin is then filed down till it projects about ¼in. or ⅜in. above the head of the tappet. The next move is to get two pieces of hard steel about ⅛in. deep made into discs the same size as the head of the tappet. A hole is then drilled through the pieces of steel to allow them to slip over the pin and lie on the head of the tappet.

After making a few thin tin washers the same size as the discs, the tappets may be put in their places and before screwing up the cylinder nuts tight see that the tappets are not too long; if so, file a little off the lower end until the valve stem has the correct clearance. If, however, as will most likely be the case, there is more clearance than the thickness of a visiting card between the tappet and valve stem, insert one or two of the thin tin washers between the steel discs and the head of the tappet.

By this method the clearance can be very delicately adjusted, and after running a few hundred miles it is an easy matter to slip in another thin washer to take up the wear. Should the steel discs get worn in one spot they are easily replaced.

G.R.T.

3,000 Miles in Three Weeks.

[6069].—Regarding your paragraph on Mr. F. E. Pither's attempt to cover 3,000 miles in three weeks, it may be of interest that I have already accomplished this on my $3\frac{1}{2}$ h.p. B.S.A. with sidecar and passenger. I received the machine from the B.S.A. works at 4 p.m. on the 19th of September last, and completed 3,060 miles by 6 p.m. on the 10th of October. Of this I have proof, and wish to add that the only attention given to the machine during that time was taking the cylinder down and scraping the piston and grinding in the valves on one occasion. The engine ran right through without an involuntary stop.

C. A. PATERSON.

Petrol Economy in Motor Cycles and Cars.

[6070].—There are at the present time many different motor cycle carburettors on the market. The significant fact that, in spite of very different design, all are almost equally satisfactory, shows that the "perfect" design is certainly not among them.

A well-known six-cylinder car has made a long run under R.A.C. observation on top gear, averaging 57 ton-miles per gallon. Allowing a motor cycle and rider 370 lbs. weight, this would mean 345 miles to the gallon! What motor cycle carburettor manufacturer can give us this economy with his special design? Motor cycle carburettors of to-day are no more economical than they were five years ago, in spite of the modern high compression, short life engine.

WILL M. BRANSTON.

Silence.

[6071].—In your issue of October 5th, under the above heading, there appeared a letter from a Mr. Knight anent the abuse of motor cyclists, complaints of which occasionally appear in your columns. To my mind, there are not half enough, always provided that they are confined to papers like *The Motor Cycle* and do not get into the daily papers. The special brand of cad who wants treading on is the man who, seeing a lady's horse become unmanageable at his approach (I am referring to a case which occurred a short time ago), roars past on full throttle, and then never even looks round to see if anything has happened.

Motor cycling must be the finest sport on earth for any man who is fond of an engine, and I hope to be getting a machine myself before very long. Mr. Knight will agree with me that, in the interests of motor cyclists themselves, the boulder should be suppressed if possible. As for riders who have to be continually using their cut-outs because their engines demand it, they require help, not abuse.

ANGLO-SCOTT.

The A.C.U. and Provincial Clubs.

[6072].—I have read with great interest the discussions raised by several of your readers with regard to the weak points of the A.C.U.

In this district, Durham and Northumberland, you hear no raging against the A.C.U. Why? We are satisfied. All the clubs affiliate to the North-Eastern A.A., and, as is known, we form the Northern Centre of the A.C.U. We have open competitions and hill-climbs yearly, which are a great success, and we have no shouting for permits, etc. Each club sends its own delegates to the N.E.A.A. meetings to obtain what they want, and if they do not attend it is their own fault.

The A.C.U. has done much to promote motor cycling since its commencement. Every motor cyclist of the present day owes a debt of gratitude to the A.C.U., yet grumbles at the paltry affiliation fee. He owes far more than his 2s. or 2s. 6d. a year if he only thinks; he would be riding a 1908 model in 1912 were it not for the A.C.U. There is only one club in this district that is thinking of leaving the Northern Centre, and I think it will find its mistake afterwards if it does.

Lastly, if we are going to organise, remember, "United we stand, divided we fall," and let us hope that in the near future the other centres will awaken and work their own affairs and get what they want if they know what it is.

R. W. HOLMES,

Hon. Sec. Durham and District M.C.C.

Wear of Big End Bearings.

[6073].—As your readers have been discussing the problem of wear of connecting rod big end bushes, perhaps the following will be of interest.

I have a $2\frac{3}{4}$ h.p. Minerva engine, now six years old, fitted to a rather heavy single-gear machine without pedals. In order to secure average hill-climbing properties under these conditions, the gear is necessarily low, and the engine revolutions at ordinary touring speeds consequently high. Up to the present the machine has run about 25,000 miles with the original big end bush, which is not perceptibly worn, and which is good, as far as I can see, for another 25,000 miles.

The bush and crank pin are both made of hardened steel. I ascribe the practical immunity from wear, not to large bearing surface (the crank pin is of quite ordinary size), but to the material of the bush. Why should not all bushes be made of hardened steel?

The popular idea that steel bushes and pins readily seize is quite a fallacy. Hardened steel differs entirely in this respect from soft steel. If at the end of every 4,000 to 5,000 miles, I had to remove the engine from the frame, pull it all to bits, and get the connecting rod rebushed, I should modify considerably my views on the "joys" of motor cycling.

J. H. SINCLAIR.

Twin Engines and Sooted Plugs.

[6074].—I am very surprised at "Would-be Twin's" letter in one of the October issues, and think his method is at fault. Let him try drip-feed lubrication.

I have had a good deal of experience the last four years with the twin Peugeot, Rex, and J.A.P., and have never had any trouble with the lubrication, except an occasional oiled-up plug, which has been in the front cylinder as often as in the back. On taking the engine down, I have always found both pistons and cylinders well oiled and about the same deposit in each; also the wear of each cylinder about the same, which, I think, goes to prove that both cylinders are receiving the same treatment.

Although I have tried one or two of the leading 1911 single-cylinder machines, I much prefer the twins—they are more comfortable, every bit as reliable, and more durable, and they do not require the attention that the single-cylinder does. I have found that the $3\frac{1}{2}$ h.p. single needs taking down about every 1,500 miles, whereas a twin will not require this attention for 2,000 to 2,500 miles, because with the reserve power you do not notice a little loss; but when the $3\frac{1}{2}$ h.p. engine loses power there is not much reserve. I also think a twin is far easier on exhaust valves than some of the singles. I attribute this to the engine keeping cooler through being able to take a higher gear, therefore fewer engine revolutions; also the twin takes less gas per cylinder for m.p.h., which means a cooler mixture.

In my opinion it is silly to try to compare singles and twins for sidecar work. A well-tuned single in the hands of an expert may be fairly satisfactory, but a well-tuned twin in the same hands would be far more satisfactory, and the engine would last nearly double the time and maintain its power much longer.

B. G. DURKIN.

Showing the quickly detachable tank on the new Ariel machines. As will be seen, the middle tube is detachable with the tank affixed.

By installing a lathe in your own garage 90 per cent. of your troubles you can tackle yourself.

Not only will you experience great saving in cost and time, but you will find the work decidedly interesting.

12,000 MILES AND STILL GOING STRONG.

110, CANNON STREET, E.C.

Sept. 7th, 1911.

I am sending herewith one of your cord tyres which may possibly interest you. I purchased it some time in 1908, and used it on the back wheel of a 4 h.p. Berkley motor cycle for nearly a year. I suppose I covered at least 3,000 miles. It was then transferred to the front (and occasionally the back) wheel of my 1909 Triumph, and my speed indicator now records 9,683 miles. Thus you will see that it has done over 12,000 miles, and looks good for another 1,000. I merely return it to show my appreciation of what I consider to be the best tyre on the market. I have two tyres in my possession, made by one of the oldest tyre firms, which are useless after 800 miles.

A Cure for Leaky Petrol Taps.

[6075].—Leaky petrol taps are often a considerable annoyance, and may often account for decreased miles per gallon.

I find the following plan effect a radical cure, and withal prevent the tap from jamming: Take the plug out, clean with petrol, and smear with brown soap; replace, and hey-presto! the trick is done. LB 44.

Up Edge Hill on a Single-geared Sidecar.

[6077].—My innocent little letter seems to have made some people quite angry. It is such a pity that, without any reference to the point of my letter, there have been two replies written in haste and on quite different points from mine.

My letter, which you published in your issue of the 26th ult., was simply calling attention to the fact that, whereas a great "shout" had been made in your paper about a single-geared machine having made a particularly fine performance, the article further disclosed the fact that on the arrival of the machine at the foot of the hill, the gear was lowered before attempting the climb.

I am convinced that I am an exceedingly bad letter writer, but I did think that I made it quite clear that I was simply remarking on the circumstance of lowering the gear, which, in fact, was an admission that the suitable gear for hill-climbing was not the suitable gear for ordinary towing on fairly level roads, and that to claim a feat for a single gear, which was really carried out after the gear had been changed, was hardly a fair bolster up of the single-speed theory.

I wish here to mention that, so far from trying to depreciate the performance in question, I consider it a particularly fine one, and never had any intention of doing anything more than protest against a performance being described as being done by a single-geared machine when it was done by a machine which employed a lower gear than was used for journeying to the hill.

As regards the different performances made by the machines mentioned in your correspondents' letters, I think the reputation of Zeniths for hill-climbing work is sufficiently established to make replies quite unnecessary on this point.

W. G. BOWER.

Saddle Position and Side-slip.

[6078].—"Ixion's" remarks *re* sideslip call to mind experiments which I conducted some years ago to definitely decide the best position for saddles to minimise sideslip.

I made a special seat pin with a front extension reaching well over the tank and an extension rearwards reaching nearly to the extremity of the machine and supported from the end by down tubes to the axle. I fitted two saddles, one on the front and one on the rear, and tested these over a certain section of road. My experiments extended over seven or eight days. "Ixion's" remarks are in keeping with my experiments. With the saddle fitted as nearly as possible midway between the two wheels, it was possible to twist about on slippery granite setts with comparative immunity from slip. If such did take place, it was slow and could be corrected. With the saddle as far back as possible and the peak practically over the rear hub, it was possible to ride the machine with care over a greasy surface, but when the sideslip occurred it was so lightning-like as to give absolutely no warning, and therefore no avoidance of a spill. Of course, from the point of view of comfortable riding the midway position was almost

AT OLYMPIA.
Showing the method of springing the saddle on the Charles-Edmund-Jap.

impossible, and in order to get well ahead of the rear wheel and yet retain a position of comfort, I lengthened the back stays of the machine with excellent effect, giving a longer and easier belt drive, in itself an assistance to stability, and at the same time having a similar effect to moving the saddle further forward.

Rake of the forks and also fork curvature were experimented with, together with wheelbase, and, while it was found that a substantial rake of steering head was no disadvantage, an excessive curvature of fork tended to make sideslip more prevalent. My final deductions were:

A long wheelbase, within reasonable limits, proved steadier than a short one, provided, of course, that lateral rigidity was not sacrificed.

A small rather than excessive castor effect on the steering and the weight as nearly as possible midway between the two wheels.

Regarding the handle-bar. The upturned bar close to the rider's body was detrimental to good control in grease, but a short wide bar, permitting the rider to lean forward at a slight angle, had the same effect, though not quite so pronounced as moving the saddle forward.

JAS. L. NORTON.

Silence and Silencers.

[6079].—*Re* your correspondent's letter on silence and silencers. I have been using a silencer very much the same as "PS 7" describes, except that mine had tubes at both ends.

It was a very efficient silencer indeed, making my old crack one of the most silent in the district. There were only

12 x 1/4 tubes, six at either end. The ends, like the one described by "PS 7," were held by one long bolt. I only used the cut-out to give warning, as there was no back pressure from the silencer. If my 1912 mount is fitted with a silencer as good as this I shall be satisfied.

E. HARDMAN.

Will the Ultra-lightweight Return?

[6080].—In reply to letters Nos. 6059 and 6060 in last week's issue, I think Mr. Griffin's last sentence answers itself—"his 1 1/4 h.p. mount if kept in tune will average legal limit in flat country." I use my 2 1/2 h.p. New Hudson three-speeder for running to and from business in all weathers, and find it quite an easy matter to lift it up and down a flight of steps daily. The same machine often has to carry my weight (13 stones) plus luggage over 170 miles at week-ends at well over legal limit average over decidedly hilly roads, which would mean pushing up several hills or "h.p.a." (heavy pedal assistance) to a greater extent than I relish or an "ultra-lightweight."

May I remind Mr. O. de Lissa that "the proof of the pudding is in the eating thereof, etc." The Motosacoche firm have fallen into line by making a 2 1/2 h.p. machine, weighing well over 75 lbs., and their latest addition is a variable gear, which will doubtless be a boon. Their discarded models are quite beside the point. It is perfectly true that Mr. H. Reilly, the designer of the Armstrong gear, fitted the first experimental three speeds and clutch motor cycle hub on an "ultra-lightweight" over three years ago, but this tiny engine soon gave way to a 2 1/2 h.p. (70 = 76 mm.) J.A.P. for testing purposes, in order to climb hills like Birdlip, etc., without "h.p.a.," and as the smaller power was not a severe enough test. I have ridden most machines which have been on the market during the last ten years, and the best really small engine in the old days was the little outside flywheel Clément-Garrard. No one ever said it was "impossible" to make a very small and cheap motor bicycle—the question is, "Is it worth riding when made?" Personally, I think not, except for short distances in towns, which seems to be the continental idea of motor cycling.

ROY W. WALKER.

Size of Covers After Retreading.

[6081].—I have a genuine grumble against tyre repairers which I have not noticed before. It is about the worthless state in which covers are returned after retreading. Nine times out of ten they simply drop over the rim, having been stretched several sizes during the repair process.

A man in the trade told me it was a sort of "lucky packet" if you had a cover retreaded whether it would fit or not afterwards. Covers are stretched bad enough during, say, two thousand miles running, and in my opinion the repairers should aim at making them smaller, not larger.

B.G.

A Rope Belt.

[6082].—It was my misfortune some few weeks ago to be on a journey when my belt gave out, through being very rotten, and I had no spare one with me, relying on being able to obtain one on passing through towns. To my dismay I was unable to do this, and my belt had given quite out. It then occurred to me to use a hemp rope as a belt, and, acting upon the thought, I went to a harness maker and got a $\frac{1}{2}$ in. rope spliced upon the machine on low gear, and as the rope stretched I tightened it by the adjustable pulley. This rope belt did over fifty miles, and would have done more. This may be useful to some of your readers should they ever be in the same predicament.

A. G. LANE.

Road Dangers at Night.

[6083].—Leaving Plymouth last week in darkness, with machine and sidecar, I was unfortunate enough to collide violently with one of half-dozen cattle proceeding in the usual manner, all over the road, with nothing to warn one of their presence. Neither a light, nor even a warning shout from the drover.

It is, I know, an oft ventilated evil, but when the victim of such evil, one does painfully realise the wrongness of laws that permit irresponsible beasts to be allowed to wonder all over a main road at night unlighted and unwarned. If I, with machine under absolute control, were to run a mile unlighted, the odds are I should get £1 or more and costs to pay. The result of the collision is a practically wrecked sidecar, it not being equal to the strain of a bullock sitting on it, and last and not least my wife had y shaken and considerably bruised. When shall we get what we over-taxed motorists pay for, viz., reasonable protection from unlighted road obstructions?

H.P.B.

Sidecars and Change-speed Gears.

[6084].—I have read with interest the various letters which have recently appeared in *The Motor Cycle* regarding the experience of users of passenger machines. I really cannot help thinking that if some of the writers would gain a little experience in the use of their machines and gears before blaming them it would be to their advantage.

I have tried several different combinations, and have had troubles with the gears, but in all cases they were due entirely to my own ignorance, either in lubrication, adjustment, or in driving. I consider it is most necessary for anyone to understand thoroughly the internal working of the gear he is using. I am now using a 5 h.p. Bat, with P. and M. gear, and sidecar. I have used this in all kinds of weather and on all kinds of roads, and it has not failed me yet. At first the gear slipped when the throttle was opened, but I found it was due to my putting thin lubricating oil in where I ought to have put gear box grease. The slipping is soon stopped by running petrol in between expanding collars. This gear has now run over 3,000 miles, and it is still as good as new; the wedge bars and rollers have not wanted renewing yet.

I rode 400 miles last summer with a lady passenger to North Devon and back. Starting from London at 3 a.m. we arrived back at 11.30 the same evening. Allowing two and a half hours for meals it averages—well, up to the legal limit. I think it speaks well for a modern sidecar combination to say that the only involuntary stop was caused through a small bolt coming out of the front mudguard stay. The spring frame is ideal for long rides. I had not the slightest backache. The sidecar is also well sprung. My passenger was quite fresh at the finish.

The Bat is a rigid sidecar having five fastenings. It takes somewhat longer to detach, but it is well worth the extra

trouble. I have found that some sidecars with the three couplings have a tendency to "whip," especially at corners, which is unpleasant both for the rider and the tyres. I have fixed a spring board on the back carrier, and find the machine strong enough to take three up most hills, including Titsey Hill, and up Anerley Hill all the way on top gear at 30 m.p.h. I have also driven the machine and passenger up Succombe Hill, near Wallingham. I think this might be called hard using, yet the machine runs as well or better than when new.

I hope that this note of my experiences will help a little to convince any uncertain prospective sidecarist that a modern two-speed combination is not all trouble. At the same time, I do not think most gears are yet perfect. The P. and M. gear, for instance, would be much better if made heavier for the higher powered machines. A gear box on car lines, somewhat similar to the Chater-Lea, is probably the ideal. It must be necessarily heavy, but this would not matter greatly if more efficiency were acquired.

I fancy a lot of the unsatisfactory results with sidecars is due to using a too low-powered machine. A $3\frac{1}{2}$ h.p. engine is not enough for very stiff hills. It is a most unpleasant business, as I know by experience, to have to shed one's passenger half-way up a hill.

W. O. OLDMAN.

The A.C.U. and the Liverpool A.C.C.

[6085].—The members of the Liverpool Auto Cycle Club feel that a clear statement of their dispute with the A.C.U. over the granting of a permit for their Two Days' Trial is a necessary correction of some of the mistakes which have been made in the recent correspondence regarding this event.

At a general meeting of members held on September 4th it was decided that a two days' open reliability trial should be held.

Previous to this the hon. secretary had written to the A.C.U. for a permit to hold an open trial of this description.

He received a telegram stating that "a permit will be granted if rules are in order." With this seeming consent the Liverpool Club decided to hold the trial, and at once went ahead with the arrangements.

Within a few days a copy of the rules was sent to the A.C.U. for their approval. The A.C.U. then objected to the trial being held on a Sunday, and suggested that we made it a one-day (Saturday) event.

We agreed to this course and altered all our previous arrangements, found a new and shorter course, etc. All this taking up valuable time, giving us a lot of work, and imperilling the success of the event.

On submitting the altered regulations to the A.C.U., confidently expecting a favourable reply, we were astonished to find that they refused us a permit for an open trial at all. They instead offered us a permit for an inter-club, limited to five clubs in the district.

This was of no use to us for several reasons, one of which was that we had been offered a fifty guinea trophy on condition that it was offered for open competition. The permit for an open trial being refused, we decided to make all competitors members of the club.

After considerable delay the A.C.U. replied to this by "banning" the event. Now had the A.C.U. refused a permit at the beginning we should not have made any complaint, but after all our efforts to meet them by altering the rules, etc., under their implied promise that a permit would be given, we felt that we had not received either fair or business-like treatment.

The only reason given for the refusal was that the trade did not wish for this trial. As we were well supported by the trade we considered that we were better able to judge than the A.C.U., and the keen interest shown in the trial proved that we were right.

The club, I may mention, is composed almost entirely of amateurs, and the trial was organised solely as a sporting event.

LEWIS MOGRIDGE, Chairman L.A.C.C.

SUMMARY OF CORRESPONDENCE.

Mr. M. K. Lee writes in strong praise of the $2\frac{1}{2}$ h.p. Premier lightweight, which he says will climb Westerham with the greatest ease without assistance, and attain 50 m.p.h. on the level.

Olympia Cycle and Motor Cycle Show

NO motor cycles housed to-day in Olympia possess so many proven refinements as the 1912 Royal Enfields.

Ease of starting and safety in traffic are ensured by the Royal Enfield Patent Two-speed and Free Engine Gear.

Sweetness of running and freedom from transmission trouble are secured by the chain drive, Royal Enfield Slipping Clutch and Patent Cush Drive.

Luxurious riding is attained through the splendid design, registered spring fork, comfortable footboards, etc.

Success in contests of all descriptions during 1911 give ample proof of the reliability and efficiency.

THEREFORE do not decide until you have inspected these splendid machines on Stand 39, or written for full particulars to Department F., ENFIELD CYCLE CO., LTD., Redditch, and 48, Holborn Viaduct, E.C.

The 2 $\frac{1}{4}$ h.p. Two-speed and Free Engine Model. Price 50 guineas.

The 2 $\frac{1}{2}$ h.p. Open Frame Two-speed and Free Engine Model. Price 50 guineas.

The 6 h.p. Two-speed and Free Engine Sidecar Model. Price, complete with Sidecar, 80 guineas.

THE W.D. MOTOR BICYCLE.

A New Model with Forced Lubrication to all Bearings.

THE W.D. motor bicycle is the joint production of two engineers named Wartnaby and Draper, who are enthusiastic motor cyclists. For some considerable time they have collaborated to design an engine for motor cycles dispensing with splash lubrication.

So far as motor cycle engines are concerned, the pressure feed to all bearings is a new method of lubrication, but outwardly the engine does not differ very much from ordinary types with the exception that the crank case is enlarged at the base to provide a sump for the oil and a place for the oil pump to work in. As the patentees pointed out, many will doubtless ask, "Why introduce the complication of forced lubrication?" In their opinion, and we confirm it, there is no objection whatever to complication, *per se*, provided it gives no trouble.

Is Forced Lubrication Wanted?

When we saw the machine last week and discussed the question with Messrs. Wartnaby and Draper they mentioned, what is, we think, quite correct, viz., that forced lubrication is more necessary on motor cycle engines than on car engines owing to the limited space available for bearings on the former type, and also the fact that in nearly all cases the crank end does not dip in oil, neither can it be made to do so where inside flywheels are fitted without a central trough for lubricating oil, for which there is hardly space in the majority of motor cycle crank cases.

The chief claims for forced lubrication are long life, maintenance of power and efficiency for long periods, sweetness and silence of running due to cushion of oil specially forced into the working surfaces, and no necessity to remember when to lubricate, as the sump holds sufficient oil for over 200 miles. The machine, which is on view at the Service Co.'s stand at Olympia this week, is illustrated herewith.

Details of the Engine.

Reference to the line drawings will show the following departures in the construction of the engine. The crank case is cast in one piece, and is provided with a cover plate at one side; this prevents oil leakage at the joints, and also facilitates the construction where the oil pump has to work. This latter is driven by a skew gear, and the pump spindle rotates vertically, the two small gear wheels of the Albany type pump being, of course, at the base of the sump and running constantly in oil.

The oil passes through a filter A at the base of the pump B, and so on to the pressure regulator C, which is a valve on the side of the crank case adjustable from the outside, and by means of which the pressure can be regulated to give

exactly the right amount of lubricant without leakage through excess. From the pressure valve the oil passes into the leads, which are cast in the crank case and lid, and branches off on each side through other leads as marked by indicating arrows to both the crankshaft main bearings.

These bearings are provided with an oil ring D which throws the superfluous oil off on to a fixed ring E on the cap of the boss. Oil flung off from these points falls into recesses in the

Sectional drawings showing the oil leads, position of mechanical pump and oil well.

caps and then through holes bored in the aluminium bosses of the crank case back to the sump.

Forced Feed up the Connecting Rod.

The lead to the crank pin bearing will be clearly seen in the line sketches. The oil passes from the right hand main bearing to the big end through the hollow crankshaft, and then up a pipe F securely attached to the connecting rod; the ends of the pipe fit in recesses at top and bottom of the connecting rod, and in addition the pipe is further held by the small metal straps shown. The pipe being recessed in the rod cannot come away through vibration. When the oil has passed up this pipe to the gudgeon pin bearing the surplus falls out on the flywheels and is thrown up the cylinder to lubricate the piston. It will be noticed that the flywheels do not revolve in oil, therefore the friction usually occasioned by the film of oil between the crank case and the rims of the flywheels is avoided. A vacuum valve (not shown) is provided on the side of the crank case. This is of the swinging disc valve type, but as the crank case is a very large size it is claimed to be practically free from vacuum.

In addition to the supply of oil carried in the sump, which is sufficient for 200 miles or more, a tank (see photograph of complete machine) is placed behind the seat tube fitted with

Belt side of the newly designed W.D. motor cycl, which possesses many novel features.

The W.D. Motor Cycle—

Valve side of the W.D. power plant, showing the oil sump at bottom of crank case

an ordinary pattern hand pump. The patentees recommend when starting out that the amount of oil should be verified by opening the trial tap in the side of the sump. If oil issues from this tap there is a sufficient quantity in the sump, and no more need be pumped in from the reservoir, but if this tap should be dry oil must be injected by the hand pump until it runs out at the trial tap. In ordinary daily use all that is necessary is to verify the level of the oil when starting out for a run; afterwards the lubrication looks after itself.

Other Features of the Engine.

Turning to the other features of the engine, it will be noted that the combustion head is separate from the cylinder, and that both are held down to the crank case by three bolts bedded in the aluminium crank case. The valves are of particularly large diameter (40 mm.), the inlet being situated over the exhaust and mechanically operated. We had an opportunity of examining one of these machines just before the Show opened, as it was being assembled for exhibition, and were interested to note that everything had been so carefully thought out on paper that the engine parts fitted together without the slightest hitch.

The crank case, instead of being made in two halves as usual, is cast almost in one piece with the sump, one side only being detachable.

This machine, the frame and other details of which are excellently constructed, is being made in temporary works at Coventry, and for the present communications regarding it may be sent to W. and D. Motors, 21, Coendon Road, Coventry.

CLUB NEWS.**Bishop Auckland, Darlington, and District M.C.**

New Year fixtures include—Annual ball, Friday, January 19th, at Darlington; hot-pot supper and smoking concert, Wednesday, February 14th, at Bishop Auckland. Arrangements are being made for two billiard tournaments at Bishop Auckland and Darlington respectively, and a winter reliability trial. Particulars of the above will be announced later.

The Motor Cycling Club.

As we have previously announced, the second winter club run, London to Exeter and back, will be held on December 26th and 27th.

Arrangements can be made for friends to start together, provided their entry forms are so marked. Passengers need not be taken by entrants of sidecars, but any entrant of a sidecar starting with a passenger must be accompanied by the passenger throughout the entire journey, and under no circumstances may sidecars be detached over any part of the route. Cut-outs when fitted must not be used.

REGULATIONS.

Meeting Place.—At the Bulstrode Hotel, adjoining Heston-Hounslow Station, Tuesday evening, December 26th.

Start.—All machines to be at the starting place by 5.30 p.m., when the sealing of the machines will take place.

Route.—The route to be followed, starting from Hounslow, is *via* Basingstoke, Salisbury, Shaftesbury, Yeovil, Chard, Honiton to Exeter, and back in the reverse direction.

A stop of one hour will be arranged at Salisbury, both ways. About two hours will be allowed at Exeter.

The schedule time at sixteen miles per hour for the first competitor at the chief places *en route* will be approximately as under:

Outward.—Hounslow, depart 7 p.m.; Basingstoke, 9.14 p.m.; Salisbury, arrive 11.29 p.m.; Yeovil, 3.12 a.m.; Exeter, arrive 6.5 a.m.

Return.—Exeter, depart 8.5 a.m.; Yeovil, 10.35 a.m.; Salisbury, arrive 12.50 p.m.; Basingstoke, 3.47 p.m.; Hounslow, 6 o'clock p.m.

Awards.—Gold medals will be awarded to all entrants finishing within twenty-four hours. Silver medals to any finishing within thirty hours.

Entrance fee, 10s. 6d. For further information apply to the trials hon. secretary, Mr. E. B. Dickson, the Croft, Pinner Road, Northwood, on or before December 10th.

B52

South Birmingham M.C.C.

A motor cycling club has been formed in the Sparkbrook and South Birmingham district, and a general meeting will be held at headquarters, the Mermaid Hotel, Stratford Road, Sparkhill, to-day, Thursday, the 23rd inst., at 9 p.m., for the purpose of confirming the rules of the club and the appointment of officers and committee, and also for the purpose of electing members. About twenty entrance forms have been received, and forms and information can be obtained from the hon. sec., Mr. Lewin Poole, 70, Poplar Road, Edgbaston, Birmingham, or at the meeting.

Cambridge University M.C.C.

A hill-climb was held on Haslingfield Hill, near Cambridge, on the 11th inst. Results:

CLASS I.—Lightweights.

1. N. B. Stewart (2½ New Hudson).

CLASS II.—Standard Touring.

	Formula.
1. N. B. Stewart (2½ New Hudson) ...	46.5
2. H. Constantine (3½ Zenith) ...	62.32
3. R. Cooke (3½ Rudge) ...	62.37

CLASS III.—T.T. Roadsters.

1. R. Pilling (3½ Triumph) ...	61.46
2. R. Cooke (3½ Rudge) ...	63.83
3. E. Lees (3½ Triumph) ...	64.37

CLASS IV.—Open on Time.

	Time.
1. J. Nash (7 Indian)* ...	36s.
2. {J. W. Cox (3½ Triumph) ...	39s.
{H. Goodwin (8 Matchless) ...	
3. B. Sandeman (7 Indian) ...	40s.

* Fastest time of day for bicycles.

CLASS V.—Multi-cylinders 750 c.c.

	Formula.
1. G. Cuffe (5 Indian) ...	69.5
2. A. Wills (5 Indian) ...	93.7

CLASS VI.—T.T. Singles on Time.

	Time.
1. R. Cooke (3½ Rudge) ...	39½s.
2. J. Cox (3½ Triumph) ...	40½s.
3. E. Lees (3½ T.T. Roadster Triumph) ...	44½s.

M.C.C. Second Annual Winter Run.

A COMPETITOR'S HINTS REGARDING EQUIPMENT.

WITH this and other events of a similar nature looming in the near future, a few hints on the subject of winter riding may not be out of place. It is well known that competitions during the winter months did not enjoy any measure of popularity until the M.C.C. decided to run its event last Christmas, and this lack of enthusiasm can be traced to several causes, viz., difficulty in obtaining a real anti-skid tyre, a weatherproof machine, suitable weatherproof clothing, and the lack of knowledge necessary for engaging in such a trial with a reasonable amount of comfort. The popular desire for a real winter trial is shown by the magnificent entry of eighty-one obtained last year, a number which, it is confidently anticipated, will be increased to a hundred in this year's contest.

Hints regarding the Machine.

Unless the carburetter is placed very close up behind the cylinder, a metal shield should be provided to keep mud and water away, and allow warm air to be drawn from the cylinder to the air intakes. Any springs should be cleaned and well oiled, and the control levers treated in the same way. The magneto is generally well protected on the modern machine. If it is not, a shield should be provided across the front and top, but not the sides. Any chains in an exposed position should be soaked in paraffin to clean them, and, after draining, treated with warm tallow and graphite, or one of the preparations sold for the purpose. The wheel hubs should be packed tight with a stiff mixture of vaseline and gear grease. See that the steering head is properly adjusted and the bearings filled with vaseline.

Tyres.

The condition of the tyres is of paramount importance. Generally speaking, rubber studded are the best anti-skids, but the studs must be large and of good depth. They should be pumped *hard* to be serviceable as anti-skids. Fit stout wire nail-catchers to both wheels, and a metal guard across the front of the footrests. The guard should be the full width of the footrests, extending level with the top of the cylinder to well under the crank case. It is surprising the difference this shield makes. Handle-bar muffs, which can be obtained from 5s. and upwards at any of the well-known motor accessory merchants, should be fitted.

Lamps.

One acetylene lamp is enough, if an additional electric head lamp is carried. Two large generators should be provided, one being placed in a protected position in case of frost. This combination is the best, as it allows for any contingency. If no electric head lamp is used, take two acetylene lamps, with at least one fixed inside the handle-bars. Remember that

in the event of a skid the lamp nearly always comes off second best. It is as well not to experiment with any new untried ideas in a long distance trial of this kind entailing so much night riding.

Spares.

See that the spares are all right, a spare exhaust valve and a spare belt cut to fit, repair outfit in first-class condition, with a large piece of stout canvas and a good gaiter. Use fairly thin oil. It is not necessary to carry any spare petrol, as the stages between supplies are all under seventy miles.

Personal Equipment.

The personal equipment is a matter for each man to settle for himself, but a good one is a tweed cycling suit, thick cycling stockings, flannel shirt, silk neckerchief (no collar), sweater pinned close at the neck and under the waistcoat, and large comfortable boots. The overalls should be of real waterproof, and the leggings provided with a seat. Stout leather gauntlet gloves are best. If the weather is wet, a storm cap, costing only 2s. 11d., is excellent. If dry, a leather racing cap is very comfortable for the night riding. A leather waist-strap with an electric lamp completes the equipment. It will be found a very good way to prepare a rough list of things to do, and to be obtained, and to strike out each item as it is settled, otherwise an important part may be forgotten.

For Tyros.

For those who do not know the road it is well to study the map carefully, and note that turnings not to be missed are the left-hand fork just beyond Andover, the sharp left turn at cross roads three miles beyond Wilton, the left fork just beyond Shaftesbury, and the right fork at the top of Chard Hill. The rest of the turnings are fairly easy to follow. Remember that, although the hills are not formidable in dry weather, they certainly are so when wet, therefore gear low, especially as the schedule speed is only 16 m.p.h., and an excess of 20 m.p.h. between checks entails disqualification. Read the regulations carefully, and if there are any of them you do not understand, get them explained to you before the start; the committee does not recognise any misreading of the regulations by competitors. Get down to the start early, and do everything the officials tell you at once. At the stopping places see to the machine first, and you will then know how much time is available for seeing to your own comforts. Carry as much carbide as you are likely to want, and of a brand which you have tried. Fit a cheap watch on the handle-bar for rough timing, and so avoid having to open your coat too often. An electric pocket flash lamp is an extremely useful accessory for illuminating the watch and also the speedometer and mileage recorder.

HAROLD KARSLAKE.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Care of Accumulator.

Q. As a constant reader of *The Motor Cycle*, and knowing you give some very good advice, I should be very much obliged if you will let me know the best way to dry and store a four-volt C.A.V. accumulator. It is at present being charged.—E.C.

When the accumulator is charged, empty out the acid, wash the plates with clean water by repeated filling and emptying, then fill up with water. When wanted replace water by acid.

Mudshields and Tyres.

Q. As an old subscriber to your valuable paper, may I ask you to be kind enough to reply to the following: (1.) Can you recommend the insurance companies—Dolamoye Evans, 199, Piccadilly, W., and Percy Butler, of Manchester. (2.) The most suitable make of large mudshields for Triumph 1911, to afford complete protection and not to interfere with front stand or pedalling? (3.) Are there any means of springing front forks better than the makers do it? Also seat pillar—do you recommend for practical use the N.A.B. spring seat pillar? Is there anything better? (4.) Are puncture-proof bands really any satisfactory way out of tyre upkeep expenses? Also retreading? (5.) Have you any experience re letter No. 5956 which was in issue of October 12th? Such a course does not answer on push cycles I know.—H.M.

(1.) We understand that the two insurance companies referred to in your letter are satisfactory. (2.) We should recommend you to try either a "Miller" or a "Dr. Stormont" mud shield. The former can be obtained from the Service Company, Limited, 292-293, High Holborn, W.C., and the latter from Messrs. A. W. Gamage, Limited, Holborn, E.C. Another excellent mud shield is the College, made by Messrs. Beard-Brown and Co., College Street, Northampton. (3.) No, there are no better means of springing the front forks of this machine. Yes, either use the spring seat pillar referred to or one of the well-sprung special saddles now on the market. Puncture-proof bands are of use in preventing punctures, but do not prevent wear of the tyre, rather the reverse. (5.) We have seen this done in the case of a car cover, but we have not tried it on a motor bicycle.

Return of Deposit.

Q. Having had the offer of purchasing a $3\frac{1}{2}$ h.p. Hummer motor cycle for £17 on the instalment system, I paid a deposit of £1, and gave a householder of twenty-two years as guarantor. I received a notice after a few days, stating that guarantor was not good enough, and as I could not find another I asked for the return of the deposit, which was refused. At the time the deposit was paid I was not given to understand that, should I not be accepted as purchaser, the money would not be returned. Would you kindly let me know if I can recover deposit?—W.C.T.

If you have signed no form at all, and merely sent the £1 deposit, we do not think anyone can legally detain your cash if he will not accept your guarantor. Under the circumstances, our advice is to write and insist upon the deposit being returned. Failing any reply, or refusal, place the matter in the hands of a solicitor, who will recover the deposit and the costs of proceedings. Of course, all depends on what you have signed. If you have signed any form agreeing to the deposit being withheld we are afraid you cannot recover.

Switch combined with Brake.

Q. Would you kindly tell me if a 7-9 h.p. twin with single-speed and sidecar would climb Westersham Hill with hot engine? My passenger and I would weigh twenty-four stones. I could use clutch if necessary to maintain engine speed. (2.) Would there be any harm in fixing ignition of present bicycle, so that when the brake was applied, the electrical circuit was broken, causing the machine to stop on compression?—G.W.

(1.) Yes, if suitably geared and skilfully driven. Do not slip the clutch more than absolutely necessary. (2.) There would be no objection.

Lubrication of Twins.

Q. I should be much obliged if you would answer me the following questions: (1.) I am thinking of going in for a powerful twin for sidecar work, and I cannot see how it is that the back cylinder gets more oil than the front one. Surely at the speed the flywheels revolve gravity has no effect on the oil, and therefore it ought to be thrown off equally at all points of the circle like sparks from a Catherine wheel. If you put water into the trough of a grindstone and turn the handle quickly, the water is thrown off from all points of the stone. (2.) I cannot understand why adjustable valve tappets are not standard on all machines. They are so convenient when fitting a new valve or when the stem wears or lengthens under heat. Is there any inherent disadvantage against them? (3.) Which form of sidecar puts least strain on the cycle frame, and which is the safest to steer (castor or rigid, not flexible)? (4.) Would it influence the working of a twin engine to any appreciable extent to fit air scoops to the rear cylinder?—T.G.H.

(1.) It is certainly a fact that the back cylinder of the twin machine gets more oil than the front one, unless some means be taken to equalise the amount. (2.) We do not think there is any objection to an adjustable valve tappet; in fact, we consider it to be a great advantage. (3.) Probably the castor wheel puts less strain on the cycle frame, but the rigid is the safer. (4.) No, it would not benefit the engine to an appreciable extent.

AT OLYMPIA. 8 h.p. Chater-Lea twin engine with bore and stroke 85 mm.

The famous

LODGE PLUG,

the premier British sparking plug,
is indisputably the most successful plug ever produced
(either in Great Britain or abroad) for magneto ignition.

No plug so reliable under all conditions and none so lasting.

For all Motor Cycles.

Note well the solid sparking points, which are made of pure (98%) nickel; and note their position in the cylinder which ensures the most effective ignition and maximum power.

- When ordering, specify "Lodge, motor cycle type." —
- See the name on the insulator, and reject all imitations. —

GUARANTEED FOR A YEAR.

At OLYMPIA

Lodge Plugs can be bought from all the leading Accessory Dealers,
and may be seen fitted on many of the best motor cycles exhibited.

TWO MODELS for use on Motor Cycles are sold:—

A steel gauge for setting the sparking points, free with every Lodge Plug.

Of all dealers, or post free by return when remittance accompanies order direct from the manufacturers—
LODGE BROS. & CO., Dept. E., 14, New Street, BIRMINGHAM.

Engine Construction.

?

Please enlighten me upon one or two points in engine construction. I am building an engine (twin cylinder) with m.o. overhead valves. The bore is 4in. and the stroke 5in. (1.) Will this engine give 10 h.p., and if not, what should the dimensions be? (2.) Will valves 1½in. in diameter be large enough? (3.) I find, according to the drawings (which, by the way, I did myself), that when the piston is at the top of the stroke the compression space is only 1in.—is this too small? (4.) Can a large engine like this be fired by means of a plain coil? (5.) Will two rings in each piston be sufficient? (6.) Could I put this engine, when complete, in a special light frame and gear it direct, that is, 1-1? —L.R.L.

(1.) The engine in question will give considerably more than 10 h.p. The R.A.C. rating is 12.8, and the actual power probably over 20 h.p. (2.) Yes. (3.) It depends upon what compression you want, but as with overhead valves you will have no pockets it is hardly enough; 1½in. would be about right. (4.) Yes, an engine of any size can be fired by a plain coil. (5.) Yes, if the fit be good. (6.) No it would be inadvisable to gear higher than about 3 to 1. Even large car engines are not geared 1-1. Such a gear, with 28in. wheels and the engine running at 2,000 revs. per minute, would give a speed of 166.6 miles per hour.

A Lightweight for Canada.

?

I am thinking of purchasing a motor cycle, and have no personal experience in the matter, beyond being a pedal cyclist. I am a missionary to the Blackfoot Indians, and have been amongst them for twenty-six years, and I find my work increases each year, and the question of locomotion is for me a very important one, both on the ground of expense and of time. After much careful thought and some enquiries, I am led to believe that I should find the careful use of a reliable lightweight motor cycle a satisfactory solution of my difficulty. The Indian Reservation covers a huge area, being about forty miles in length and nine miles in width. The "trails" (roads) are good, but are often well rutted, and yet the ruts are not, as a rule, deep (from two to four inches). The winds are frequent, and there are several hills, though neither very steep nor very long. These latter difficulties make the ordinary cycle a severe tax upon one's energy. I am no longer a young man—being 53—and am anxious not to tax my strength unduly. I have been recommended to entertain the Douglas, and from what I can hear it should be just the kind I am looking for. I don't wish to travel fast—I mean that fifteen miles an hour would be as fast as I should wish to move—but I do not wish to be shaken up by vibration, nor to have heavy running expenses, nor a constant repair bill. I should need at times to use a simple light sidecar, so as to take my daughter with me to help in the services. Does the Douglas haul a sidecar?—H.W.G.S. We think that the 2½ h.p. Douglas, the machine about which you specially enquire, would suit your purpose admirably,

as it is well-made, reliable, and not unwieldy. You will not notice the vibration unless the roads are very rough, engine vibration being non-existent on this machine. The makers do not recommend the use of a sidecar, and we fear that the roads will not be suitable for such a means of taking a passenger. The freight charges would be £2 5s. 6d. to a port in Canada, and the duty 20% on the actual wholesale value.

Gears and Clutches for Sidecars.

?

I am shortly taking my motor cycle to pieces for packing away during the winter. Could you tell me the best way to pack and preserve the inner tubes, also if a 4½ gear is too high for sidecar work, fixed gear all-round riding, and if a Mabon clutch is any advantage?—J.M.

The best way to preserve inner tubes is to pack them in a box with French chalk. 4½ to 1 gear is too high for sidecar work, except with a powerful machine. It certainly is for a single cylinder. 5 to 1 would be nearer the mark, or even lower. A Mabon clutch would be a great advantage for starting purposes

and would assist slightly on hills, but should not be slipped too much—only on the last stretch of a bad hill to keep up the engine revolutions.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"H.P.S." (Brooklyn, N.Y.) Scott two stroke, particularly with regard to cooling after running with open throttle.

"J.W.A." (Coventry). 7-9 h.p. Indian and 6 h.p. Zenith-Gradua for sidecar work.

"M.T." (London). Foot starter wanted for 1912 8 h.p. Bat-Jap and Mabon clutch.

"R.C." (Manchester). 7 h.p. Indian sidecar reliability consumption.

"J.F." (Medbury) Osborne four-speed pulley on a twin Rex.

"H.P." (South Lancing). Lomax or other detachable bands.

"W.J.B." (Middlesbrough). Roberts non-skid bands.

"H.S." (Newcastle-on-Tyne). Packer and Prentis decompressor.

SUMMER MEMORIES. A beauty spot. Gawsorth Church, Cheshire.

An Expanding Pulley Gear.

The members of the expanding belt pulley A are caused to rotate together by pins B. The fixed pulley flange carries a sleeve C, upon which is mounted a second expanding pulley D which takes no part in the drive, but co-operates with a wedge piece E to actuate the movable pulley flange A. One end of the wedge piece is anchored to the engine at F, and the other is connected to the operating pedal G, a spring H normally driving the wedge piece inwards, pressing the pulley flanges A together, and providing the highest gear. Depression of the pedal withdraws the wedge piece, allowing the flanges A to separate and provide lower gear ratios. Full depression of the pedal may allow the flanges

A to separate so far as to permit the belt to rest on a ring J, providing a free engine, and connected to the lever G

Enfield Autorette.

The Enfield Autorette is not on view at Olympia this week, as the Enfield Autocar Co., having shown this vehicle at the Car Show, were precluded from exhibiting it elsewhere.

A Locking Switch.

Mr. V. W. Brandt has provisionally protected an electrical switch, which is to be seen on Stand No. 20. This switch is put into action by a key having wards, which the owner carries, and is intended to prevent theft.

The Tourist Trophy Race Fund.

Mr. C. H. Hitchen, Morecambe, informs us that he is willing to sell fifty brass exhaust whistles (the usual price of which is 7s. 6d. each) for 2s. each, and he will give the £5 he receives to the above fund. This is a sporting offer, and one which motor cyclists should consider who desire to see the fund increase.

Catalogues Received.

The catalogue of the Hazlewood 2½ h.p. motor cycle is to hand. This contains illustrations and descriptions of the Jap-Hazlewood engine, Armstrong three-speed gear, etc. Copies of the catalogue can be obtained from Hazlewoods, Ltd., West Orchard, Coventry.

An advance proof of the 1912 Douglas catalogue is to hand containing 112 pages of matter. The first portion gives a brief history of the company, then illustrations and full specifications of the various Douglas models, and, lastly, a section devoted to hints and tips.

is a jockey pulley K, which takes up the slack of the belt when the gear is reduced.—A. T. Thomas, No. 27,897, 1910.

A Three-speed Crankshaft Gear.

In place of the usual driving pulley there is keyed to the crankshaft a sleeve B, upon which is rotatably mounted a sun pinion C, engaging planet pinions D, free to rotate on spindles E, on a carrier F. The carrier F also carries the driving chain wheel G. The internally toothed ring, or annulus H, completing the epicyclic train, is carried by a sleeve J. This annulus and the sun pinion C are prevented from backward rotation by one-way clutch devices. Rotating with the sleeve B is a driving member K, carrying cone clutch surfaces LM, the former engaging a corresponding cone on the annulus sleeve J, and the latter a cone secured to the sun pinion C, and these clutches are operated by levers N through face cams O, the clutches being normally pressed into engagement by springs P. In operation, when both clutches are in engagement the epicyclic train is locked and a direct drive is obtained. For the first reduction the clutch M engaging the sun pinion is released. The drive is now through the annulus H to the planet pinions, the sun pinion being held against backward rotation by the one-way clutch before mentioned. Rotation of the

pinions around the sun pinion therefore takes place, rotating the carrier F and the chain wheel G. For the second reduction, the clutch M is engaged with the sun pinion and the clutch L disengaged. The drive is now from the driver K to the sun pinion C, this in turn rotating the pinions D. The annulus H being prevented from backward rotation, the pinions rotate within it,

again transmitting the necessary motion to the carrier F and chain wheel G.—J. J. H. Sturme, No. 21,768, 1910.

A Spring Belt Rim.

The name and address of the patentee of the spring belt rim published on page 1200, is Mr. J. W. C. Bassett, 21, Bank Street, Cheadle.

Centaur in London.

During this week the Centaur Cycle Co., Ltd., will be showing their 1912 models at their London Depot, 21, Holborn Viaduct, E.C.

A White Tread Tyre.

Gaulois tyres are now specially made to fit English rims. The most noticeable feature of these tyres is the white rubber tread, which, it is said, does not cut so easily as the ordinary grey type. A grey tread is manufactured as well, but the white is more expensive. Both beaded and wired-on tyres are supplied. The most substantial cover is the "triple stripe," a three-ribbed tread, while a further speciality is a steel-studded cover with a thick tread, consisting of a leather band, under which there is a pad of soft rubber. The Gaulois Tyre Co., whose address is 6, Bath Street, City Road, E.C., also manufacture a well-constructed butt-end tube, the joint of which is so designed that there is practically no possibility of the ends coming apart.

Sidecars in London.

Motor cyclists contemplating the purchase of a Montgomery sidecar can inspect these machines at the sole agents for London, Messrs. Phelon and Moore, 4, Percy St., Tottenham Court Road, W.

Detonating Plugs.

The British Low Accessories Co. advise us that they will have a good display of their special Cup detonating plugs on view this week at 15, Great St. Helens, E.C. We hear that these plugs have been greatly improved by the fitting of solid nickel points.

Flexible Petrol Pipe.

Mr. J. Sarolea has invented a flexible pipe in which a closely coiled spring is inserted into the rubber connection with the object of protecting the rubber from the deteriorating effect of the petrol.

Trade Changes.

Mr. G. E. Roberts, a well-known member of the M.C.C. and Coventry clubs, has re-joined the Simms Magneto Company.

The Wulfruna Engineering Co., Ltd., Great Brickkiln Street, Wolverhampton, inform us that they have been appointed sole representatives for the new 2½ h.p. vertical Moto-Réve engine and engine set. The other models will, of course, be handled by the Moto-Réve Co. as before.

Messrs. Siemens Brothers and Co., Ltd., Caxton House, Westminster, S.W., inform us that the dry battery branch of their business has been transferred to their Woolwich works.

ADDRESS: 20, TUDOR STREET, LONDON, E.C.

Again the Clubs and the A.C.U.

ONCE again the Auto Cycle Union has met representatives of affiliated clubs in an endeavour to arrive at some satisfactory scheme which will put an end to the constant grumbling—mainly on the part of affiliated clubs. It will be recalled that the refusal of the A.C.U. to grant the Liverpool Club a permit for an open reliability trial stirred up feeling in the North; other clubs joined in, and the outcome was that a meeting took place last Saturday to enable the associated clubs to state their grievances. During the afternoon the hon. secretaries of provincial clubs met to consider their plan of campaign, and in a nutshell practically all were agreed that provincial clubs had not sufficient voice in the control of the pastime, and that the present A.C.U. General Committee is not sufficiently in touch with the sporting side of motor cycling. Further, they could overrule any recommendation of the provincial clubs. Ultimately a resolution was drawn up for presentation to the A.C.U. to the effect that the representatives of provincial clubs on the general committee should consist of thirty active motor cyclists, any one of whom could represent a number of clubs and be entitled to a vote for each club he represented. This, of course, could hardly work, as the committee would become unwieldy, besides, four representatives each with six votes would be able to carry any resolution. The sum total of the discussion at the evening meeting was that the provincial clubs have not adequate representation, and, as at present constituted, can easily be overruled by the London clubs. It was pointed out that big provincial clubs were not entitled to send a representative, although much less important clubs near the capital were represented; this is not as it should be. The

local centre scheme was recommended as the best solution, and we certainly hold this opinion. An amendment to the original loosely-worded recommendation was carried, but on being put as a substantive proposition it was lost. It was clear that the club representatives had no set policy; the discussion will, however, be ultimately of service.

The Outlook.

TO say that the Show at Olympia was prosperous would be putting it very mildly; it was a colossal success from every view-point. Exhibitors were practically all satisfied, although there was a murmur from one or two occupants of stands in the Annexe who were closely adjacent to loud-voiced vendors of wares that were neither cycles nor accessories. A notable feature this year was the rush of cycle agents, who have previously held aloof from the motor cycle business, to gain some information regarding, to them, the "new industry." It was a case of the early bird and the worm, for they found in most cases that the agency plums had already been snatched up by their more enterprising brethren. As in previous years, visitors thronged the stands of exhibitors who have done well in competitions.

Every purchaser of a new machine must place his order at once or no machine will be forthcoming when it is wanted. When the Manufacturers' Union decided to hold an annual exhibition at Olympia many opinions were expressed concerning its success. At the conclusion of the exhibition we were told officially that the attendance at the 1910 Show had been the greatest on record, but that this year the attendance had been increased by 70 per cent. Nearly all of this was represented by the public who paid for admission.

By B. H. Davies

AS I wandered thoughtfully round the stands at Olympia I found my memory harking back to the previous phases of evolution in the cycle trade, and saw history repeating itself. The pedalling boys of the old brigade will all recall how rapidly the main outlines of the push bicycle became stereotyped, and how thereafter one show was very much like another, except for the occasional eruption of some brilliant invention like the free-wheel or the multi-speed hub. Year succeeded year, and the main novelties handed out by publicity managers to serve weary travellers as "talking points" for next season resolved themselves into perfections of inconsiderable details. It is a healthy sign when an industry reaches this stage. It is no sign that invention has exhausted itself; rather is it a sign that invention has exhausted its subject, and that in main essentials finality is in sight. Now the motor cycle is a far more complex proposition than the push bicycle; the manifold components of its specification give a designer far more range and scope; and if Olympia has produced no crowd of really startling novelties, I am far from saying that finality is upon us already. Nevertheless, the motor cycle has, beyond contradiction, "shaken down" so far as its main features are concerned. Engine design, frame design, ignition, carburation, and general outfit have taken shape; one exhibit is pretty much like another, and there is a great levelling up of quality. The rider of a 1911 mount will not be so very badly out of date in 1912; and the odds are at last in favour

variable gear. No longer need the corpulent aspirant delay purchase because he shirks the walking or running mount. He can make his choice between countless machines which can be started from the saddle by pushing down a lever, and will move off sweetly

The latest design of 2 h.p. Quadrant lightweight.

and gently on the clutch. No longer can we extend pity to the inept tuner of engines, who conks out half-way up a bad hill on a sultry August day; we shall hereafter only mock at his folly and pride in bestriding a single-gear mount when there are others about. The veriest duffer can now ride a motor cycle without running any inevitable risk of being dubbed a sportsman. The modern motor cycle is childishly easy to handle on dry roads at moderate speeds.

Two Important Points.

Two great problems remain in an interesting stage—the problem of weight, and the problem of transmission. In the matter of weight we are all ready and eager to be converted. None of us ride heavy machines because they are heavy. It is all a question of compromise. The whilom enthusiast on an 8 h.p. twin is quite ready to buy an 80 lb. lightweight as soon as those lively little locomotives can break a "60" dial speedometer; and the "open muffler boob" (as the Yankees term him), who now disports himself on a T.T. $3\frac{1}{2}$ h.p. single is ready to ride a $2\frac{3}{4}$ h.p. twin as soon as these vivacious doubles can scratch out another 15 m.p.h. In the meantime the bulk of the demand is gradually sliding lower and lower down the weight scale, and there are unmistakable signs that before long the $2\frac{3}{4}$ h.p. multi-speeder twin will sell at least as freely as the "F.E. $3\frac{1}{2}$ h.p." The transmission question is more open. Belts are deliciously easy to cobble, and only a combination of bad weather and steep hills can make the most critical of us ferociously discontented with a good inch belt. Still,

The new twin-cylinder six-speed Matchless, with overhead valve J.A.P. engine.

of an absolute novice fitting himself out with a really roadworthy machine, even if he be too proud to avail himself of skilled advice. All this is to the good.

Probably the chief advance upon last year is to be identified by ease of starting from rest, and increased hill-climbing certainty. There was scarcely a stand in the Show which did not include a free engine and a

A Critic among the Solo Models.—

there it is. The men who influence public opinion are the men who most often essay phenomenal hills in a heavy downpour, and I am inclined to think that

New 2 h.p. Lincoln-Elk lightweight.

the chain is slowly but surely coming back into its own. Firms who for years have been faithful to the belt are incorporating the chain, if only as one item of a mixed drive, and straws show which way the wind blows.

The British Machine.

I wonder, by the way, if there is any other sphere of industry in which British capital, British designers, and British labour can show such a sweeping triumph. For every first class machine of foreign manufacture on the international list, there are at least a dozen Britishers of equal grade.

There are less certain signs that other evolutions are just beginning to take shape. I think every practical road rider would agree in saying that our two crying needs are improved springing and improved lubrication. The Show produced earnest and clever attempts to grapple with both problems. A number of spring frames were exhibited, of which only the Bat, the N.S.U., and A.S.L. already possess a large *clientèle*. I specially liked the P.V., recently described in these columns, and the Edmund, which was new to me. The latter secured all the necessary lateral rigidity, while its springing utilised every possible inch of leverage, and included a frictional damping device to minimise bouncing. I thought the check-

M.R. single-cylinder model, in which there is only detail alteration beyond a slightly lower frame.

bar of the carrier, against which the cee springs butt, might cause a noise on very bad roads, but the plan has real possibilities, and was very well thought out. Several other spring frames were handicapped by obvious uglinesses, or constructional defects. The stream of tendency was sharply divided in the matter of lubrication. The multitude of drip feed lubricators are at least a confession on the part of the trade that something is wrong, but, except in the way of visibility, they showed no real advance on our old friend the J.A.P. drip feed. The inverted domes and tilted glass cylinders may be easier to watch than the vertical barrel of the J.A.P., but possess no other advantage; and in some cases the new designs were really retrograde in comparison. I saw several which relied on crank case suction for the oil feed, possessing no pump of any sort or kind, and others in which the pump merely served to produce air pressure in an oil tank. Either of these systems would put the rider in the cart if the tell-tale glass were broken. However, any sort of drip feed, with a hand pump in reserve, spells real progress, and the more visible it is the better; but I must say I had hoped for something a trifle more original than the discarded leavings of motor car designers, and was therefore rather disappointed.

3 1/2 h.p. Campion with Roc two-speed gear in the rear hub.

Forced Lubrication.

Mechanically operated oil pumps figured on one or two machines, and are known to be satisfactory in the way of keeping a correct level of oil in the crank case, but they do not force the oil by conduits under pressure to all the bearings, and can, therefore, only be considered as an advance on spring pressure-fed drips. Some consider a motor cycle engine unsuitable for driving a pressure feed oil pump, and that it takes an appreciable amount of power to do it, but there has been much talk of forcing the oil under pressure to each separate bearing, and we shall doubtless come to that if the strain on the big end bearing is increased as recklessly as it has been in the past. For this reason the W.D. machine, described in our Show issue of November 23rd, was to me the most interesting mount in the Show. Without entering into technicalities, one may say that if a rider fills the crank pit of this engine to a certain height on starting out, he may forget he has a lubrication system until he has covered 200 miles; at the expiry of this distance, he opens a cock on the crank case, acting as a level tell-tale, and pumps oil in till the tap oozes, after which he may

A Critic among the Solo Models.—

safely ride another 200 miles. The design is well thought out, and in other respects the engine should be a clipper. A world of experience, thought, and comparison has gone to the perfection of its valves and timing, for instance. But a glance at the engine rebukes those who glibly prate of the need for stan-

of slim, soft bolts. Many pannier toolbags continue to be secured by flat plates and lilliputian bolts and nuts. When will the trade learn that only a doubly bent plate and locked nuts can last out 100 miles? Nobody seems specially sanguine about solving the exhaust valve bother. I failed to obtain a single guarantee of an unbreakable exhaust valve, and "stretching" is more common than ever it was. I had two machines last year—one never broke a valve, but always stretched them; the other never stretched, but often broke.

Important Details.

The carriers of many new types will come adrift on the first rough road. The screw-down petrol valves are a thousand times better than tight and leaksome taps. Adjustable spring tappets are the rule. Engine trouble is a thing of the past with the best makes. Tanks, like Caesar's wife, are above suspicion. The wheels are more quickly detachable than a Rudge-Whitworth or Riley car type—chiefly because a stand is quicker than a jack. The waterproof magneto has come at last. Carburettors are wonderfully improved. Wheel bearings

are waterproof, and do not necessarily lose their adjustment if a wheel is slipped out. Engines evince an average rise of about 10% on last year's actual horse-power. Variable gears are at last Legion, and the Show contained practically an even quantity of single and variably geared machines, which in itself is a record. Free engines are almost universal, and, apart from their control gear (see above), are very satisfactory; but why, as one firm prefers, have two separate hand levers when we are eager to see such matters foot-operated? A good Show, my masters, to which the Vicar of Wakefield could safely send son Moses with a £50 cheque and no tremors.

dardised forced oiling. The trade cannot be expected to go to the trouble and expense of building so refined a design until circumstances compel them; and at present splash oiling serves the ordinary man's needs fairly efficiently.

I cannot pretend to handle such an enormous exhibit in detail, but the following points struck me forcibly. There will be road trouble with some of the foot starters. On many of them the two sprockets, with centres six inches or so apart, were a good inch out of line in one position or the other; some designers left them out of line at rest, others when in operation. Neither plan should make the engineer responsible burst with pride. Many of the overhead inlet valve systems will wear disgracefully. The buyers who fancy this system should look at the N.S.U. for an example of staunch and silent construction. The clutch pedals on many machines were simply ridiculous, and only fit for operation by the tiny foot of a *première danseuse*. The New Hudson people are on the right lines in compounding their leverage, but even here a bigger footplate is desirable. Pedals which a car owner would deem fooling for working a cut-out are applied to the control of a clutch which is not always smooth. On some machines the spring pulls the clutch in; where this is so, a tiny pedal is comparatively pardonable. On others the heel piece has to be used to force the clutch in, steadied by the toe piece; and when the rocking lever is only 6in. long and the foot plates are no bigger than a crown piece, graceful starts will be difficult. The majority of the cylinder heads are still placed just where they can best char the trousers, and are destitute of guards. The adjustments of some rear brakes are bound to strip or snap in the first emergency. There are still makers who evince a fondness for clips composed of a small bent piece of thin metal, and a couple

5-6 h.p. Matchless two-speed T.T. roadster.

The side-by-side twin-cylinder 3 h.p. Aleyon.

The Light Side of the Show.

THERE are twelve different ways of seeing the Show, and I adopted the thirteenth. It was a method all my very own, and one fraught with tremendous possibilities. Briefly, I went to Olympia with an idea, and let the idea take me whither it listed.

This idea of mine had all the charm of simple grandeur. I would go to the Show, I said, and I would buttonhole a director of any one of the leading firms. (One is always sure to find the board of directors on the stand!) I would lead him gently to some dark corner in the hall—unfortunately, there's never any room round the refreshment bars—and there breathe into his ear a real business proposition; to wit, that the said leading firm should present me with a *modèle de luxe*, which I would undertake to test for them thoroughly, reporting results. "Another Road Record by a Shamateur—Ten Miles a Week for a Fortnight." Something like that. Though I was quite prepared to promise anything up to 500 miles a day, so long as I got the bicycle. I would even waive the question of fees and expenses. And the managing director and his board would weep warm tears of gratitude down the back of my neck, and forthwith despatch me my choice by wireless.

Counter Attractions.

That was the idea. That it was not crowned with complete success I ascribe simply to the fact that I was distracted from the pursuit of it by the many counter attractions which beset me as soon as I entered the building.

I entered from Hammersmith Road, between flanking mountains of empty crates. Evading a slim young man with an eagle eye and a chewed cigarette who wanted me to take a free sample of something I didn't want—it was not a free engine—I made my way to a stand where I knew original ideas were likely to be appreciated, and looked for the managing director. My attention was distracted by a hilarious couple who were inspecting a hip-bath on wheels.

"No, Algernon," she said, "it wouldn't do at all. There's only room for one."

"Unless, petsy, we sat *very* close together!"

I fled, blushing, from this "Dawn of Love."

Close by was a motor cycle fitted with a sort of jaunting car seat over the back wheel. A *very, very* stout lady examined it dubiously. Her son, or son-in-law maybe, was expatiating on the joys of riding on a pillion seat. She looked round at the interested spectators, embraced them all in a motherly grin, and said, "I don't fink!" And we all agreed with her.

Too Tempting for One's Relations.

Passenger machines were, indeed, a pronounced feature of this year's Show. Tricars, quadcars—the latter not to be confused with the defunct forecars—were present in forms as varied as their etymology, and sidecars have attained a degree of luxury too tempting, methinks, to one's wife's twenty-stone relations. One machine in particular had hood, luggage grid, portmanteau, wind screen, apron, and side doors all complete. There would be no keeping mother-in-law out of that.

That feature, and the large number of ladies' mounts, accounts for the very large proportion of the

fair sex who graced the Show with their presence, as compared with former years. Which is all to the good, for no sport or pastime can really be called popular unless it appeals to the partners of our joys, as motor cycling very manifestly does. The thousands of ladies whom I saw at the Show on the opening night are sufficient witness thereto.

But I digress: I am losing sight of my idea. Passing a stand where, in response to the query, "Are you in the 'trade'?" a visitor was giving ocular proof to the attendant by showing his hands, which were certainly dirty enough for a dozen trades, I brought up alongside a big central stand. Here were displayed the products of the firm which I had mentally decided were to be favoured with the benefits of my idea. They would be the most likely to jump at the chance of adding yet another record ("One hundred miles on a gallon of beer!") to their many achievements.

Chasing the Chairman.

I looked for the board of directors. Away in the far corner was a pale distinguished-looking man, thoughtfully spitting into a palm-pot. The chairman, likely. I edged my way round the vast expanse of stand: but by the time I reached the spot, he had vanished. I next spied him lurking in the south-west corner. I circumnavigated the stand again, but by the time I was halfway round, he was back in the north-east.

"This must end!" I muttered grimly, and I stepped over the cords. Just then I felt a touch on my shoulder. I looked round and saw a total stranger, holding out to me a box of cigarettes. I took the box. "No, no," he grinned. "Just take *one*," with an unnecessary emphasis on the "one." I took one. What is there about me, I thought, which compels utter strangers to lavish gifts upon me like this? Then I saw the benevolent stranger proffer his box to someone else—a very ordinary-looking person. Some Yankee advertising dodge, I guessed; and promptly decided it would be safer to give the cigarette to a weary-looking policeman standing near. In the meantime my quarry, the pale, distinguished-looking person, had vanished. His place was taken by a youth with a cut-away chin who looked as if an idea would hurt him. I passed on, foiled.

At the next stand was a machine with a change-speed gear, connected to the lever on the tank by a natty set of cranks and levers. When I came up a confident young spectator, with the awful colour scheme of a bright red face and a railway-green muffler, was showing his companion "how it worked." The attendant was nowhere near—he never is.

"You just move it this way," he said. . . . "Blight the thing! it's stuck—bit stiff—just move it like this . . . grrrh!! . . . oh, lor'!!"

Something gave way. The red-faced young man and his friend folded their tents, like the Arab, and silently crept away. The attendant then came up and I caught his startled and suspicious eye, and hastily followed the red-faced young man with the emerald scarf and his friend.

By the way, another great feature of this year's Show was the large number of working models and sections. All provided with handles so that the enquiring mind

The Light Side of the Show.—

could see the wheels go round. And every handle with an enquiring mind diligently turning it, while its delighted lady friends watched the pistons "jiggling" up and down. At one stand, enquirers were saved the labour of turning, a messenger boy being permanently clutched to the handle. The boy was on the low speed all the time, and looked very bored. But I venture to say his model was the only one to survive the whole of the week. For a real engine test, better than 44,000 miles of road work, commend me to the ordeal a working model has to go through during Show week at the spasmodic hands of enthusiastic seekers after knowledge.

After an amusing interlude at a stand where a young lady in a hobble made a determined, and at last a disastrously successful, attempt to mount a lady's model, I turned to business again.

"What about the idea?" said I to myself. "I will away to the Gallery, prospect the ground from above,

and then descending, fix my man and clinch the deal."

I "awayed" to the Gallery. There I saw a scandalous flirtation between a decorative bandsman and a *chic* waitress; I saw an unnecessarily large number of unnecessarily noisy youths; and, finally, prospecting over the rail, I saw, in the centre of the hall below, a prosperous-looking individual in a rotund red waistcoat with gilt buttons—a motor cycling magnate—a whole board of directors in himself. And he ornamented the stand of a company whose products are the very last word.

"I will ride an Ultimate Word!" I cried enthusiastically. I descended hastily, found the magnate, and told him all about it. It took him some time to grasp the idea in all its complex beauty. Then he spoke. He said—but no! I have been brought up on prunes and prisms, and I cannot repeat what he said. But he said it very emphatically indeed. After what he told me I can see I shall have to *buy* my next year's machine after all.
H.R.T.

A TANDEM-SEATED QUADCAR.

IN our last issue we published an illustration of the Rollo quadcar, which is being made by the Rollo Car Co., Ltd., Conybere Street, Birmingham. As the title implies, this little vehicle has tandem seats, and weighs only $4\frac{1}{2}$ cwt. The appended sketch of the chassis shows that the engine—an 8 h.p. J.A.P.—is carried in front and attached to engine plates in a way similar to a motor bicycle. The combustion heads are cooled by two fans; the bonnet will also open at the top, as illustrated in the photograph showing a plan view of the body, etc. The frame is made out of one length of $1\frac{1}{2}$ in. weldless steel tubing, bent inwards at the front and joined across the back. Across the frame is a counter-shaft driven by a silent chain; the transmission then goes to the road wheels by means of Whittle belts on expanding and contracting pulleys, one on each end of the counter-shaft. To tighten and slacken the belts to suit various gears, the rear axle A can be moved backwards and forwards. The axle is attached to semi-elliptical leaf springs A', and a rod and lever connects it with the operating lever B, the motion being communicated through a knuckle joint C to levers D D and so on to forks E, on the counter-shaft pulleys, which open or close the flanges as required. By this means an inter-connection is secured between the moving back axle and the counter-shaft pulleys, so that when the flanges are opened the distance between the centre of the counter-shaft and the centre of the back axle is automatically altered to coincide with the amount of opening of the flanges on the counter-shaft pulleys. The equivalent of a clutch is obtained by placing the heel on the pedal F, so operating the knuckle joint C, which draws the lever G backwards and operates the forks E independently of the back axle. The pulley flanges then fly open, the belt drops on to the bottom of the groove, and a free engine is obtained. By pressing on H, the knuckle joint is returned to its locked position, and the forks which operate the pulley flanges remain in the position they occupied before the joint

A plan view of the Rollo tandem-seated quad.

Details of the chassis of the Rollo quad car.

was broken. It will be seen that this mechanism allows a free engine at any position of the rear axle.

A variation of speed from 4 to 45 m.p.h. and gear ratios of $4\frac{1}{2}$ to $7\frac{1}{2}$ to 1 are obtainable by means of the hand lever at the side, and by means of the pedal the speed can also be reduced to free engine instantaneously and the machine brought to a standstill in traffic. The front of the chassis is sprung on one central coiled spring, so that it is provided with three-point suspension. Steering is by wheel and double steel wire cables. These are connected to the front axle by means of strong spiral springs, which cause the wire cables to be always in tension, so absorbing road shocks. The cables are wound round a wooden drum at the base of the steering column, and when the drum is turned the steering motion is communicated to the stub axle of each front wheel. The brakes are compensated, and the shoes, operated by Bowden cables, are inside the belt rims of each wheel. The operating cables are attached to a fixed portion of the chassis, and there is sufficient play of the cables between the brake shoes and the anchored positions to allow for the backward and forward movement of the rear axle.

The dimensions of this little vehicle are wheelbase 8ft. 2in., track 3ft. 4in., overall width 3ft. 10in., and length 10ft. 6in. The body, which is coachbuilt, presents a remarkably smart appearance; it is upholstered in pegamoid, and hair-stuffed; the back of each seat is provided with springs, and the cushions are made detachable. The petrol tank has a capacity of about four gallons and lubrication is by pressure from engine exhaust, with a visible and adjustable drip feed to the crank case.

The starting handle, which fits on just in front of the side door, is so geared to the engine that it revolves the latter two or three times to one; it is therefore quite easy to start the engine on the magneto. The vehicle is sent out complete, with two oil side lamps, one tail lamp, acetylene head light, horn, and ample kit of tools.

OCCASIONAL COMMENTS

By "IXION"

Driving from the Sidecar Seat.

A friend of mine declares he has solved the problem of driving a rigid sidecar comfortably from the sidecar seat. He steers with the help of a stout cord, ending in a wooden grip, tied to the far end of the handlebar. He has a separate control, of the Bowden wire type, mounted on that stay of the sidecar which bolts to the seat-pillar lug of the bicycle. I give his opinion for what it is worth.

Newspaper Diagnosis.

The inevitable handicaps under which an enquiry bureau labours are rendered evident in the following incident. A friend who was still in his novitiate informed me that his machine was remarkably difficult to start, but that when once the engine fired the machine ran perfectly, and the engine developed full power on hills. I made a number of obvious suggestions of an elementary kind, but after testing them all he told me that his trouble still continued, and finally I paid a call at the low corrugated iron shed which he is pleased to call his garage. Within ten seconds I discovered that his pedalling gear was remarkably stiff in action, and a moment more sufficed to trace the stiffness to the pedalling crank spindle. A glance showed that one of the pedals bore the marks of a heavy fall, and a turn of the cranks showed that the stiffness was confined to one point in the circle of revolution, and that there was no squeaking noise. Obviously, therefore, it was not a case of a broken ball or an overtight cone, but of a bent spindle. But what expert at the desk of a newspaper office would guess that a bent pedalling axle was the reason why the engine of a brand new machine would not start? Wherefore, oh ye new readers, be merciful to us if we are not always inspired in reply to your agonised appeals for assistance.

The Eclipse of the Featherweight.

In one respect Olympia is a little surprising. Two or three years ago a good many cognoscenti confidently expected the 80 lb. lightweight to come into its own by about this time, but once more its boom is postponed. I say "postponed" deliberately, because as soon as an 80 lb. machine can be produced which can do all that a $3\frac{1}{2}$ h.p. or a two-speeded $2\frac{1}{2}$ h.p. can do, speed only excepted, the 80 lb. machine will come out on top. The coming of the variably geared medium weight has been slow. It is a good many years since I first sampled the $2\frac{3}{4}$ h.p. type of twin; little by little it has been perfected until regarded as a tourist mount, pure and simple, it is the equal of a $3\frac{1}{2}$ h.p., i.e., it is quite as reliable, quite as sure a hill-climber; and as a consequence it now ranks as a very formidable rival, since few of the new generation of motor cyclists wish to travel at 50 m.p.h. History may be expected to repeat itself. The next phase of

the industry should see two parallel processes. The $2\frac{3}{4}$ h.p. multi-speeder should in a large degree oust the $3\frac{1}{2}$ h.p., which is heavier and more expensive; and simultaneously lighter machines with smaller engines will gradually depopularise the $2\frac{3}{4}$ h.p. Finally the fittest will survive for ordinary purposes in the guise of an ideal featherweight.

Valve Cotters on Small Engines.

A detail which seems to stand in urgent need of attention on small engines is the valve cotter. Old stagers like myself can well remember the days when we invariably carried two or three spare inlet and exhaust cotters in our purses to make sure of having a spare handy, since we well knew they would be freely and frequently required. To-day I can exhibit an exhaust cotter which has run for two years under a 40 lb. spring. The old troubles are being repeated with the miniature valves on some small engines.

Whenever I get the opportunity I inspect the valve cotters on such engines, and in most cases I notice that the spring pressure is too much for the cotter. Its back is bent, and its extremities have bulged and flattened, so that strenuous work with a file will soon be needed to extricate the cotter, unless it solves the question by snapping in half.

This is simply a question of metallurgy; the springs on small engines are weak by comparison with those on a $3\frac{1}{2}$ h.p. or an 8 h.p., and though the cotters are correspondingly smaller, they would stand up to their work if they were made of better material.

Wm. Bennett, of Scorrier, Cornwall, who is 67 years of age and an ardent rider of a $2\frac{3}{4}$ h.p. Royal Enfield. The above photograph was taken on the occasion of a fifty mile trip over some well known Cornish hills.

Cost of Running a 3½ h.p. Motor Cycle.

Further Replies to a Reader's Query.

Sir,—In reply to "H.M.'s" query which appeared in *The Motor Cycle* of November 2nd: I have taken some pains to get the figures as correct as possible, and hope my notes will be of use to some readers of your excellent paper. I began the season in April as a novice.

Petrol, 4,500 miles odd (50 gals.)	£2 19 6
Lubricating oil (3½ gals. Price's Huile de Luxe)	0 17 6
Duty and licences	1 10 0
Accessories, etc.	2 13 9
New lamp generator	0 7 6
Second-hand speedometer	1 0 0
New springs, spare valve, two plugs, and other items	1 15 6
Collan oil and grinding mixture	0 1 6
Footrests, belt odds and ends	0 11 0
Accident to handle-bars	0 4 0
Storage	1 15 0
Holiday running expenses, not including petrol, lubricating oil, or lodging for two nights	0 10 0
One waterproof suit and case	1 8 6
Total	£15 10 3

Cost per mile = .827d.

Or, subtracting the price of spares and things bought but not used—587d.

A friend bought the machine new in September, 1910. In April he bought a T.T. model. The same month I bought the 3½ h.p. 1910 free engine Triumph from him after it had run about 1,500 miles. Hence the machine, tyres, and parts have really done 6,000 miles.

I have allowed nothing for depreciation, because the machine is still worth what I gave for it.

F. SPARROW.

Sir,—In response to your request for readers' experiences regarding cost per mile of running a 3½ h.p. motor cycle, I give below average costs, which I think will be found to be borne out in actual practice. The following statement of costs agrees substantially with a similar statement which I sent to you for publication several years ago, and which I believe was the first statement of cost to be widely published. At that time the idea was ridiculed in the Press that the running cost of a motor cycle could be well over one penny per mile, as I then stated it. Since then, however, riders have become more closely acquainted with the facts concerning running cost, and I feel sure that the experience of a large number of your readers will coincide with the statement below.

It may be advisable to point out that the depreciation in market value of a motor cycle is much greater than in the case of ordinary machinery. Not only does the market value of a motor cycle decrease rapidly owing to the rapid rate at which changes in detail and design are being made, but the machine does not continue to perform its duties as well as when new, owing to the effects of use, and the decrease in efficiency is rapid as compared with ordinary machinery.

Below is the average cost per mile of running a 3½ h.p. motor cycle, based on a distance of 6,000 miles per annum:

	Per mile.
Depreciation 1d.
Repairs and renewals 1d.
Petrol, oil, and licences 1d.
Tyres 1d.
Total cost per mile 1½d.

The total cost of a penny farthing per mile may be considered as the minimum for 5,000 miles per annum. If we add an extra farthing for depreciation, one eighth of a penny for repairs and renewals, one eighth of a penny for petrol and oil, and one farthing for tyres, making a total extra of three farthings, to the penny farthing above, we get twopence per mile as the cost of running the same machine with sidecar for 2,500 miles, that is, half of the yearly mileage of 5,000 miles. CHAS. WALMSLEY.

Sir,—Having ridden a free engine Triumph for eighteen months, I have kept a careful account of cost of running, etc.

Apart from interest on capital and depreciation, it figures out as under. I use the machine almost entirely for business, on journeys averaging about eighteen miles, and in all weathers, and have covered 5,450 miles on the original tyres. A fortnight ago I took off the cylinder for the first time and found about a thimbleful of deposit. You will see my running cost is less than ½d. per mile.

63 gals. Shell	£3 13 6
1½ gals. Vacuum A	0 6 9
Repairs, two belts, inner tube, etc.	4 6 11
Licences one and a half years	1 12 6
Fire insurance one year	0 10 0
Total	£10 9 8

H. Y. BEALE.

Sir,—The following are the running expenses of my 3½ h.p. Rex and sidecar "Saucy" from January to date, mileage being by 1911 Cowey. Result, 3d. per mile for two passengers.

The combination, single geared with adjustable pulley allowing 6 to 1, but seldom used. With passenger, portman-teau, and camera up I easily climbed Chatham Hill on 6 to 1 gear. Returning from Margate via Maidstone I ascended Wrotham on a 5½ to 1. I can touch 40 m.p.h. (by speedometer) all out on the level. Recently I took my passenger in sidecar, together with another passenger on the carrier (8½ stones), to Southend and back in the day, using a 5½ gear. We climbed Brook Street and Rayleigh Hills all up, but shed the back passenger on Crays Hill near the top. I use and can recommend the Service leather belt and Palmer cord tyres and Lodge plug. F 3480.

[We shall publish a number of further instructive replies on the above subject in subsequent issues, the cost of running being a subject which has created a lot of interest at this season of the year.—Ed.]

	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	TOTALS.
Mileage	560	330	10	600	520	630	800	550	800	300	5,100

Oldham and District M.C.

The above club on Tuesday, November 14th, held an interesting billiard match at headquarters, the Crown Hotel, between married and single members. The games were well contested, the "married" team eventually proving victorious.

North-west London M.C.C.

As previously announced, the A.C.U. permit has been granted for the winter reliability run to Gloucester and back on Saturday, December 30th. The route is *via* Stanmore, Amersham, High Wycombe, and Oxford, starting and finishing at Jack Straw's Castle.

Walthamstow M.C.

The annual dinner and prize distribution will take place at the City Arms, St. Mary's Axe, December 16th. All motorists are welcome. The membership has now reached seventy-six, and as there are several valuable cups and numerous other prizes for competitions during 1912, a very successful season seems assured.

Essex M.C.

A paper, "Motor Cycles and Motor Cycle Accessories shown at the Olympia Show," will be read before the members of the Essex Motor Club at the Royal Automobile Club premises, Pall Mall, S.W., on Thursday, December 7th, at 7.30 p.m. Motor cyclists are cordially invited to attend. Entrance by western door.

Pontefract M.C.

This club held a breakdown competition at headquarters on Wednesday last. Five minutes were allowed to get the machine in running order, and it had to run for 15 secs. Mr. Smith won both events, the faults being, first, the contact breaker screw removed and the throttle lever wire disconnected, and secondly, a faulty plug and a choked jet.

Perth and District M.C.C.

The annual business meeting and supper were held at the Royal George Hotel, when prizes were distributed to the season's winners and the following officers were elected: President, Mr. A. L. Watt; vice-president, Mr. A. G. Forrest; hon. sec., Mr. J. Beveridge; hon treasurer, Mr. B. Syme. The evening terminated with some music.

Birmingham M.C.C.

The third round of the autumn reliability trials will be run on Saturday next. Competitors qualified to take part in this round will meet at the Stratford Road tram terminus at 3 p.m. sharp. The course will be from Birmingham to Stratford, Sunrising Hill, to the Round Tower, Edge Hill. This is to be the first stop, and tea will be partaken of here. The return journey will be *via* Stratford, Alcester, Studley, to the King's Head, King's Heath tram terminus. Other members of the club are invited to accompany the competitors on this round, and are requested to report any stops made.

North Middlesex M.C.C.

A very successful whist drive was held on Saturday, the 18th inst., at headquarters, Ye Old Gatehouse, Highgate, a large number of members and friends being present. Thanks are due to Mr. Blakey, who kindly presented the prizes, and to Messrs. D. Grey Blakey and J. M. Butterfield for making the necessary arrangements. The first club dance takes place on December 8th, at headquarters, evening or fancy dress. The supply of tickets being limited, early application for same should be made to the hon. secretary, Mr. D. Grey Blakey, "Heathfield," Great North Road, Highgate, N., or to any member of the committee. All those interested are cordially invited to attend, and it is expected a very pleasant evening will be spent.

Mersey M.C.

The annual general meeting will be held at the club headquarters, St. George's Restaurant, Redcross Street, on December 7th, to be followed by a smoker, supper, and prize distribution.

Blackpool and Fylde M.C.C.

This recently formed club is now in full working order. The secretary is Mr. E. Taylor, Victoria Café, Blackpool. A silver trophy has been promised. A reliability run to the top of Shap Fell will take place on Boxing Day.

Redditch and District M.C.C.

A dinner will be held on Thursday, December 7th, at the Unicorn Hotel, at 6.45 p.m. This will be followed by a smoking concert and prize distribution. Future competitions: A "breakdown" competition will be held at the headquarters, on Wednesday, December 13th, at seven o'clock. A motor cycle will be put "out of order," and the competitor who diagnoses the trouble and puts the machine in running order in the shortest time will be adjudged the winner.

Surrey M.C.C.

The fifth annual dinner and presentation of prizes will be held at 7.30 p.m. on Thursday, December 14th, at the Angel Hotel, Guildford.

A lecture by Mr. W. G. McMinnies will be delivered on the same evening, starting at about 8.45. The subject will be "Speed and Power," and the lecture, which will deal largely with carburation and the new carburettors, will be fully illustrated with lantern slides.

Purley and District M.C.C.

The 100 miles night trial on 18th and 19th inst. was run off over roads which, although nearly dried by a keen wind, were flooded in four places. Of seven starters five finished. There were four surprise controls, and the total errors from a fifteen miles per hour schedule resulted in Mr. D. H. Ebbutt (3½ Precision and sidecar) being first on points, but he was disqualified for not stopping at the last control; and in a dead heat between Messrs. R. Charlesworth (3½ Zenith and sidecar) and S. J. Taylor (2½ Douglas). These two will re-ride the course next Saturday, 2nd December, starting at 4 p.m.

A NEAT SPRING FORK.

Messrs. Crawley Bros., of Heckerill Works, Bishop Stortford, have designed an extremely neat spring fork, of which we append an illustration. The sketch is self-explanatory, and it will be sufficient to give a short description of the action.

The wheel is carried in a floating fork, which is connected to the main rigid fork by suitable guides in which it is free to move upwards or downwards. The movement is controlled by springs acting on an extension of the floating fork, and enclosed in a tube fixed rigidly to the main fork above and below the steering head. The upper of these two springs serves to take the load while the lower acts as a damper or rebound spring. An adjustment for spring tension is provided, and takes the form of a screwed cap at the top end of

the tube which encloses the springs.

The fork has a very neat appearance, and should the necessity arise it is easily dismantled.

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 26, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Rear Springing Devices.

[6086].—With reference to the correspondence and articles in your columns re spring frame motor cycles, I am pleased to testify to the excellent results from the N.S.U. spring frame. I bought one of these machines in August last purely as an experiment.

When I add that in the Liverpool trials I had a puncture and did not know it until a fellow competitor drew my attention—you may judge for yourself. The spring frame I feel certain will become standard on all machines. My experience of motor cycling has been gained in my occupation as a commercial traveller.

H.B.

Belts and Bad Weather.

[6087].—Referring to the Service Co.'s letter [No. 6000] on the above subject, I was an interested spectator at the Herts County open speed trials at Luton Hoo, and I believe Mr. F. W. Barnes used the leather belt referred to on his Zenith-Gradua and sidecar. It will be remembered that in the reports of this event it was stated that his belt slipped, so partly losing him the race. I think that we can safely assume that such an experienced competition rider as Mr. Barnes would not start without having his belt properly cleaned and adjusted. My experience is that leather belts are superior to rubber ones in wet weather, but both are unsatisfactory under such conditions. I shall have chain or shaft-drive on my next new sidecar mount.

E. W. CHOLDCROFT.

Quarterly Trials Results.

[6088].—Taking non-stop runs and the order on the test hills into consideration, it will be seen that I made by far the best performance in the heavyweight class in the 1911 Quarterly Trials. My times on the test hills showed that I was only 39½s. out, while the next one in order, also a Rudge rider, was 85½s. out. We both made non-stop runs, but I was deprived of my non-stop certificate on one of the trials for omitting to have a magneto shield on my Rudge machine. This was only a small technical error, but nevertheless it prevented me from winning the cup, as I made by far the best performance on the hills, as well as doing four non-stop runs.

CECIL S. BURNEY.

The Motor Cycle in Canada.

[6089].—I have been reading with interest riders' opinions of motor cycles in distant lands. I must say that the average frame is not strong enough for the rough and rocky roads of Canada. I have been riding a 3½ h.p. for six months in this district, but finally finished up with a broken frame, which broke clean off at the steering head while only travelling at a slow speed. I came off uninjured, leaving fragments by the roadside to be carted home the next morning. The rims and spokes are not strong enough; my wheels are a long way from being true. Also I note the Tangent Cycle Co. state the Triumph suits us in the country surrounding Toronto. I suppose that does not include Muskoka, but if the Tangent Cycle Co.'s representative should be up this way I should be pleased to show him some roads that will soon put a machine out of commission with constant riding. The pleasures of motor cycling are a temptation to one even if the roads are bad. I am the only motor cyclist in Gravenhurst.

Muskoka, Canada.

W. MORRISH.

Are Provincial Shows Wanted?

[6090].—Now that we have had so successful a show in London, it seems to me high time to agitate for a motor cycle show in Manchester.

How long is it since a fair collection of motor cycles was shown in this sporting district? About four years, I think. We have our show for cars, but surely we can claim sufficient interest to ask that we shall not be left in the cold altogether as regards motor cycles, for it is an impossibility for many of us to get to Olympia. Shall we ask in vain?

JEFFRIES HAROLD.

Touring in South-west Wales.

[6091].—During a recent tour in South-west Wales, I had occasion to visit a farm near Llansawel, Carmarthen shire. Leaving Carmarthen by the Lampeter Road *via* Altwallis, I took to the mountain track at New Inn and crossed a most terrible seven miles, rising to 1,256 feet, coming out on to the Llan-y-byther-Llansawel turnpike at Rhydwmerau. This "road" across the mountain consists of lumps of slate about the size of one's foot, water splashes, transverse gutters, sand, and gates alternately, with one fair bit of about a quarter of a mile on top where one can ride on the grass. It was raining when I crossed with my P. and M. loaded up with baggage, a gallon tin of Shell, quart of oil and suit of oilskins. By using the low gear, I managed to get across in the saddle. I asked several farmers on the Llansawel side if a motor cycle had ever before been seen on this "road," and they said "no." I shall be interested to hear if any of your readers know this track. Does any reader know the exact steepest gradient of the Fishguard Hill on the Newport side? Local report says 1 in 3½. I climbed both these hills on the run (turning round) after a "blind" from Newport. This is what a touring machine should do, and it is absurd allowing competitors in trials to cool engines before test-hills.

BD 50.

A Lady's Experiences of the Pastime.

[6092].—Feeling sure the question of expense keeps many ladies from buying a motor cycle, I want to tell them that it is quite possible to get an old machine, cheap that goes well. I tried to get a lady's model second-hand, but found the price beyond me, so I had to content myself with a man's. I had the luck to get an elderly 3½ h.p. Bat that had sown its wild oats, as it always starts at once at a walking pace, will go up any hill I have met at any speed from a crawl to an excess of the legal limit; it is as comfortable and safe as a bath chair, infinitely more so than a push cycle. The secret of its good behaviour, I think, is that it has a low compression De Dion engine. I certainly did not at all fancy mounting like a man, but I reasoned he would not mount that way if it were not the easiest, so I took my courage in both hands, leapt, and found myself safely seated in the saddle; it is easier than mounting an ordinary lady's bicycle.

Of course, I am a light rider, but I have gone hundreds of miles alone, and had no trouble but an occasionally slipping belt. I find that motor cyclists are always ready to help. The old Bat has persuaded two friends to invest in motors, and I think two more have decided to take the plunge.

I am persuaded that I look much better on a motor bicycle than on a pedal machine—a great point this with ladies! A little ingenuity has got over the skirt trouble.

CR 994.

A Suggested Midland Winter Trial.

[6093.]-With reference to the winter trials generally, I should like to ask whether it would not be possible for one of our big Midland clubs to arrange an open reliability trial on Boxing Day for the benefit of Midland motor cyclists who cannot, through various circumstances, participate in the London-Exeter run? I think most of us will agree that, while the London-Exeter run meets the requirements of those residing in and around London, yet it is hardly fair that the rest of England should not be given the same opportunities for enjoying a days winter sport, and I, for one, feel sure that if such a trial were arranged in the Midlands, it would be attended with much success. CECIL PEERS.

Protection of the Magneto.

[6094.]-The week ending October 28th a friend and I undertook a short tour in North Wales. Unfortunately we encountered very stormy and wet weather, the Sunday's ride home being in continuous rain and hailstorms. When we were about twenty miles from home my friend's machine, a 1911 Bradbury, suddenly stopped. We soon located the trouble, which was due to water having found its way into the magneto, and after an hour's delay matters were put right. Such a trouble (even on a pouring wet and stormy night) would never have occurred had his magneto been provided with a substantial cover similar to that fitted to the magneto of my B.S.A. Needless to say, my B.S.A. in this respect did not give me the slightest trouble. I must mention I experienced similar trouble with my last mount, the magneto being exposed.

The B.S.A. and Bat, built with the magneto entirely protected, are machines which must interest the all-weather rider, and I hope to see 1912 touring machines provided with a serviceable and substantial magneto cover, which I think is an absolute necessity.

ALL WEATHER RIDER.

[The Bosch Co. have now brought out a perfectly water-proof protection for their 1912 motor cycle magnetos.—ED.]

The A.C.U. Reinstatements.

[6095.]-Your readers may like to hear what I think of my reinstatement? Naturally, I am pleased, as it will enable me to ride in the T.T. Race before I become too ancient. Moreover, I have been very lucky in the End-to-end record, and could hardly expect to regain it if it were broken. My present intentions are to ride in the T.T. Race, and perhaps at Brooklands, but track work has not such attractions for me as the open road. I should much like to have another cut at the End-to-end, as I consider that another two hours could be cut off if the engine held. Mine did not last out owing to the seating of the exhaust valve going, and I lost a lot of time on tyres. However, that is all in the game.

I dare not say that I am now going to behave myself and back the authorities up, as I fear that no one will believe me, but my promise holds good until June next year to abstain from all record road attempts, and I consider it extremely unlikely that I shall make any further attempts. After all, in these days there are so many commandments. "Thou shalt not box," "Thou shalt not exceed the limit," etc., that the ordinary man revolts and lets off superfluous energy. Hence I regard the T.T. as the safety valve of the movement. We must let our projectiles out sometimes. Every one does it, of course; but I see no reason why we should be sent to Brooklands to do it. Practically no skill in corner work is required—the road is the thing, and if it can be legalised all the better; if not *tant pis* for the offender.

I am sorry to observe that our tame Catt is shut up behind "bars." Why are Gibson and myself let free. Does the A.C.U. wish to scotch us as the most likely offenders in the near future? It would be interesting to know whether Gibson has given his promise *never* to go again. I have not. Two years may see great changes.

IVAN B. HART-DAVIES.

Sidecars and Single-cylinder Engines.

[6096.]-In view of the recent correspondence about sidecar work, perhaps my slight experience may be of interest.

I purchased a $3\frac{1}{2}$ h.p. single-cylinder single-geared machine in May last to which I attached a heavy coach-built sidecar. I was quite a new hand at the game, and, probably,

that accounts for my selling same a month later. I must say I was very disappointed in the combination—it would not go, as I fondly believed, anywhere. Where serious hills existed I always had to drop my passenger, and occasionally myself, and I was not sorry to see the last of this combination.

I then invested in a 6 h.p. Matchless, passenger model, with two-speed and twin belts, and Millford sidecar. Now I have no interest in these firms, but I am thoroughly satisfied with this combination. I cannot speak too highly of the machine. I have never had to drop my passenger or push, and during my holiday in North Wales it never jibbed at a hill, and I went out of my way to find some bad ones. One hill certainly I could not get a grip on, and that was the Little Orme from the Rhos side, but even then I did not stop, although I came fairly close to it, but the surface was very loose. I should like to know the gradient of that slope—the last twenty yards at the top.

The double belt drive is very efficient. I have tightened belts once in 1,150 miles, and on my journey to Wales from Birmingham—105 miles (the last fifty of which were in the pouring rain)—I never once felt a suspicion of slip. The two-speed enables one to move away like a car—it cannot slip, the lever working on the ratchet system. I have had magneto control fitted to handle-bar, also cut-off switch, both of which are a big boon, and with XL all-pan saddle fitted, which is most comfortable, I consider I have got one of the most reliable turnouts. SATISFIED.

Lamps and Winter Riding.

[6097.]-I am much interested in lamps and winter riding, and should like to let your readers know by what methods I have induced my 800ft. F.R.S. lamp to give the finest light that I think can be got out of it. I have a medium-sized Lucas generator, and after buying it immediately relieved it of the padding and filtering material it contained, which I have never found to be any benefit, but often a source of trouble. I did the same thing with the F.R.S. lamp, and on trying it I found that with its 14 litre burner as supplied the beam was decidedly narrow and very inconvenient for seeing cross roads and round curves.

Accordingly I cut away the hood and front part of the front door to the point where the door widens to its broadest dimensions, and fitted a new and rather thinner front glass, quite an inch bigger in diameter than the original. This first improvement gave me considerably more near-side light, which is often useful, and I was also surprised and pleased to find that the light was now as bright with the front door shut as open, which was decidedly not the case before.

FAMILY SIDECARS.

H. R. Webb, of Fenny Stratford, Bucks, and his $3\frac{1}{2}$ h.p. two-speed Bradbury and sidecar. He tells us that since July he has covered 4,000 miles and has had no trouble whatever.

Next, to improve the breadth of the beam, I fitted a 28 litre burner, which made a tremendous improvement, and I can now see both hedges on a broad road.

Finally I found my generator was not always able to keep a bright and steady flame at so large a burner, so, by way of experiment, I joined the generator and lamp by eighteen inches of bicycle inner tubing, and now, when I turn a good supply of water on, the tubing swells out with gas, and I get a full, bright, and steady flame at the burner as though I was using a big car generator. My lamp now gives a splendid, never-varying light, showing up objects clearly and well over a hundred yards ahead, and my only wish now is for a 7in. F.R.S.

H. SOWERBY.

The Prevailing Conditions in Canada.

[6097].—We have only just noticed in your Overseas Number letter [5943] signed, "A Man on the Spot," who is pretending to make the English manufacturer think that 28in. wheels are wanted here, handle-bars V pattern, level with the saddle, and, last but not least, a spare set of parts with each machine. Quite an order for the English manufacturer. Your correspondent's experience up to now must have been with the "junk" type of motor cycle. It has come to our knowledge that someone in Toronto is trying to induce a motor firm of undoubted merit in England to build a colonial model with 28in. wheels.

We may say that our experience with motor cycles for a large number of years has taught us that an engine clearance of 4½ in. to 5 in. is sufficient. We should like "Man on the Spot" to sign his name in future, and then maybe we may find a fly in the ointment.

TANGENT CYCLE CO.

Toronto.

Fitting a Variable Gear to a Lightweight.

[6098].—Perhaps some of your readers could help me in a little difficulty. My father uses a 1910 model 250 c.c. Wolf single-cylinder motor cycle. The machine is a fixed gear one, and we wish to know how it can be converted to a variable geared machine, i.e., a two or three speeder or failing that to a free engine machine. An engine-shaft gear is put out of court by reason of the outside flywheel. The width between the two rear forks is about five and a half inches. Most hub gears seem to require over six inches. I believe the forks could be widened by a competent repairer. The gentleman in question has never learned the running mount, and it is rather a heavy addition to the day's work, in a country (medical) practice, to pedal into animation a 2½ h.p. machine weighing 100 lbs. with a seventy inch pedalling gear.

There does not seem any hope of obtaining one of several very successful and widely advertised change-speed hubs unless one happens to be a manufacturer or a prominent (sh)amateur. I feel I should like to ask Mr. Roy Walker if he ever bestrode one of the 1909 Wolf lightweights of 1½ h.p. 63 mm. x 66 mm. Their only drawback was the round leather belt and jockey pulley. The machine weighed 72 lbs., and cost £19 19s., and gave excellent service for over a year in a fairly hilly part of Stirlingshire.

I consider that this year's competition results will have made the heavy brigade open their eyes. The lightweight T.T. winner's speed was very little below the senior figures.

Next we have the Humber lightweight figures for the hour record. Lastly the 2½ h.p. A.J.S. machines chased the 3½ h.p. Rudge to the last mile for the A.C.U. quarterlies championship.

I should be very glad to hear from riders who have transformed similar machines or from members of the trade who would be willing to undertake such a conversion as to probable cost, additional weight, etc.

ALEX LINDSAY.

A Plea for the Cut-out.

[6099].—With reference to the proposed new regulation prohibiting the use of cut-outs, perhaps my own case may be of interest.

I own a 2½ h.p. J.A.P. engine machine, and with the cut-out open my machine makes very little noise, if any, up to twenty miles an hour than does a modern 3½ h.p. with cut-out closed. When I close the cut-out, the engine is absolutely silent, only the ticking of the valves being heard. It would be impossible to ride always with cut-out closed, as, apart from the fear of overheating, it would be most

uncomfortable, especially on a long ride, for what is more pleasing to the ear than the even throb of a good engine.

With my silencer I am able to shut off all noise when passing horses or other animals on the road, and many a nod of thanks I have received from riders of nervous horses for so doing. In travelling through a town one certainly does not do above fifteen miles an hour when there is very little noise with the cut-out open. If this regulation comes into force it will mean that I shall have to enlarge the bores of my silencer and do away with the cut-out; it will then make nearly as much noise as it does with cut-out open, only I shall not be able to cut right off for passing animals on the road, also I fear that with my small engine it will affect it in hill-climbing.

Of course what makers should fit is a silencer that is perfectly safe to use with no cut-out, and quite silent without fear of back pressure and loss of power. But who is to pay for the fitting of these new silencers? We have to take what the makers give us? I quite think that a regulation is wanted to stop those people who career about towns on powerful machines at high speeds with cut-outs open. We have to thank these people for the new regulation. The cut-out does not affect the more powerful machines to the same extent that it does their less powerful brethren.

S. W. TURNER.

The A.C.U. and the Liverpool A.C.C.

[6100].—May a mere amateur looker-on suggest to Mr. Lewis Mogridge [letter No. 6085] that there is room for an amateur body, not under trade control or influence? It might take a little time to develop, but it would be worth the trouble, apparently.

VETERAN.

A Plea for Crankshaft Plain Bearings.

[6101].—Why do not more makers fit, or at least give their customers the option of, plain bearings to the engine main shaft? Ball bearings, unless of very large size, are quite unsuitable when they have to withstand a pounding action, and in a petrol engine, subjected as they are to the explosion shock received via the connecting rod, the balls become so many centre punches resisted only by the intense hardness of the bearing ring. When wear does take place, further wear and final destruction of the ball bearing is extremely rapid. I believe it has been demonstrated by tests that a well-made, well lubricated plain bearing gives about 97% efficiency, so that a ball bearing under equal conditions can, at most, be only about 3% better, if absolutely efficient.

The initial effort required to rotate a ball bearing under load is certainly less than that required of a plain bearing, but this only when sufficient time has elapsed to allow the film of oil to be squeezed out of the plain bearing; once on the move and the lubricant reaching it, the plain bearing immediately attains its efficiency.

It may be urged that ball bearings requiring less lubricant can be run under conditions that would cause a plain bearing to seize. How about, under the same conditions, the big end bearing of the connecting rod, which is a plain bearing, even on engines with ball bearing main shafts?

To conclude, my contention is—after many years' riding experience—that ball bearings are not desirable on the petrol engine used by the man who requires durability and sweetness of running of his engine, even at the cost of the alleged slightly more efficient ball bearing engine. Perhaps there are others who possess the views of

PLAIN BEARING.

[We do not understand our correspondent's real objection to ball bearing crankshafts; they seldom if ever give any anxiety on well made engines, and apparently retain oil better than the plain bearing.—Ed.]

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

SHOW GLEANINGS.

Naturally, there are always one or two items left over which cannot be dealt with in a show report, as they very often arrive too late to be included.

Autotrix.

The No. 1 Autotrix shown by Edmunds and Wadden, and described in the Show report, is fitted with what is known as the "Auto-gradual" gear. This consists of a fixed pulley mounted eccentrically on a bracket midway in the frame. Between the fixed flanges there is a movable flange. The drive is by belt to the counter-shaft, the belt from the engine pulley running on the left of the two flanges, and by belt from the other flange to the rear wheel. The right side division of the pulley is provided with a loose ring on which the belt runs in the free engine position. Moving the counter-shaft forward tends to tighten the rear

The new 3 1/2 h.p. Matchless engine, which is a replica of the J.A.P.

Lucas generator fixing for flat or round brackets.

Blumfield Engines.

A further visit to the stand of Blumfield, Ltd., of 70, Lower Essex Street, Birmingham, revealed a late arrival on the stand—a dog clutch gear box. Both shafts are supported in double row Skefko ball bearings, which allow a universal movement, and thus prevent any possibility

Blumfield adjustable valve stem.

of the bearings binding. This gear box is specially designed for side-car work in conjunction with the latest Blumfield twin. The connecting rod of the twin was, also, worth careful examination. The forked portion was made as short as possible, and to obtain this it was slightly offset. The inner bearing consists of a steel bush, secured by the ends being rolled over, while the innermost bearing through which the crank pin runs is a floating phosphor bronze bush, unsecured in any way. In the natural course of events oil issues from the timing gear through special channels to the main shaft journals and crank pin, but holes are carefully bored on the outer side of the connecting rod bearing to conduct to the right place any oil which may get there through "splash."

The Twin Fafnir.

One of the features of the Chater-Lea exhibit was a twin Fafnir engine, 5-6 h.p., 70 x 80 mm., a beautiful piece of work and possessing a cone clutch gear

box, forming a unit with the engine. This gear is a well-tried article, which, up to the present, has not been pushed by the agents for Fafnir engines, Strauss and Co. The twin Fafnir is fitted to the A.S.L., and is well spoken of.

A new Blumfield water-cooled single-cylinder engine and honeycomb radiator.

The Sée Band and Tyre Co., Denmark Street, Charing Cross Road, W.C., showed on Messrs. Lohmann's stand a new device known as the "steel grip repair band." This band is provided with steel grips at each end to fasten round the wire of a wired-on tyre or the bead of a beaded tyre. The steel grips securely attach the band, which makes an exceptionally neat fitting, enveloping as it does the exterior of the cover in the case of a burst. It should command a ready sale.

of the two belts, causing the drive to be taken up. The more the counter-shaft bracket is moved forward the higher the belts mount the pulley and the higher the gear, while the lower gears are obtained by moving the bracket in the reverse direction. In the case of the other three-wheeled Autotrix the 8 h.p. twin engine is placed amidships in the frame. On the engine-shaft is mounted a plate clutch, and behind it and driven by chain a Chater-Lea three-speed gear box. From gear box to back wheel the drive is also by chain. The body is provided with a scuttle dash, and is open in front so that air may reach the cylinders, while in future models an air deflector will be fitted. The gear control lever and the rear brake lever are carried inside the body. The model shown at Olympia had direct steering, but in future models, we understand, there will be a sprocket mounted at the bottom of the steering-shaft with a chain encircling it connected to rods coupled to the steering arms.

3 1/2 h.p. T.T. model Eli-Precision.

Show Gleanings.—

Motofrip.

A considerable crowd was attracted to the Moto-Rève stand to see the Motofrip, a tiny belt-driven motor tricycle carrying a 1½ h.p. M.R. engine. The wheels are 10in. in diameter, and only one of the rear wheels is driven. It is intended to be used as a runabout by both sexes for short distances, and is reminiscent of the Max motor cycle, as the rider is intended to stand instead of sit in both instances.

The Motofrip (the invention of a lady) which was shown on the Moto-Rève stand.

Star Punches.

Mr. S. T. Robson, 59, Hornmoor Row, Birmingham showed an ingenious belt punch made to adapt itself to any size belt. The belt is first put upside down through the "stirrup" of the punches, then the sliding portion A is pressed down upon it, holding it tightly in position, so that the hole may be drilled truly and dead in the centre. This was to be seen on

Robson's belt punch.

Messrs. Broadhurst's stand.

The Swan.

Among the novelties exhibited last week was the Swan motor bicycle, made by the Swan Motor Manufacturing Co., Frodsham, and illustrated in our Show report number. The frame is of aluminium alloy, braced with steel at the necessary points. There is also an inner frame pivoted on ball bearings and placed in the centre of the main frame. This frame is made of the same aluminium alloy, and is designed to carry a dog clutch type of gear box, it also carries bearings for the sprocket shafts of the chain drive. The rear forks are hinged to the frame, their ends being supported on laminated springs anchored at the forward ends to the frame. As the sprockets are carried centrally in the inner frame the chain line is not altered in any sense, and there is no alteration in the distance between the centres of the chains either between engine and gear box, or between gear box and much the spring portion may move. The total weight is between 160 and 170 lbs. The machine is suitable for either women or

The change-speed quadrant attachment on the three-speed James. This consists of a T lug and a piece of tube; it is both ingenious and neat.

men. When it is delivered suitable for a member of the fair sex a guard is placed round the cylinder. The firm has the introduction of water-cooling under consideration.

The New Hudson Co. can supply footrests and footboards which are interchangeable one with the other.

A late arrival on the stand occupied by W. H. Dunkley, jun., Alvechurch, was a sidecar, the frame of which has been specially strengthened to carry the type of body with which it is fitted. This body may be best described by being called scoop-shaped. It is provided with scuttle dash, which lifts up to allow the passenger to enter, and when closed down affords ample protection. A side door allows access to the body. A spacious locker is provided for spares, etc.

The Dunkley coach-built sidecar. One of these is being used for a long distance ride referred to in the Current Chat pages.

One of the most interesting sidecars in the show was that attached to a 3½ h.p. P. and M. and shown on their stand. It was one of Montgomery's castor wheel patterns, and was one of the few which had a properly sloped hack. A storm apron was made to clip round the passenger's neck. The body was of the basket type, and two stands were fitted, one to prop up the sidecar wheel, the other lets down when the sidecar is detached.

1. The new 3½ h.p. clutch model Hobart-Precision. 2. 2½ h.p. Handy Hobart, which now has a vertical engine.

Show Gleanings.—

Villiers Two-speed Hub.

This hub was exhibited by the Villiers Company, Wolverhampton, and is one of the simplest of its kind. It is an adaptation of the Villiers clutch hub, the clutch consisting of a number of semi-circular half tubes of metal arranged concentrically with one another, alternately as drivers and driven members.

The sketch shows the left end of the hub with the internally-toothed driving

End view of the Villiers two-speed hub gear showing the sun wheel and planet pinions. Lower sketch shows the fixed dog clutch.

pinion removed. The four planet pinions mesh with a sun-wheel, which can be slid along the fixed spindle to enable a direct drive and an indirect reduced speed. These pinions revolve on pins carried on a bracket which forms the driving member of the clutch. This bracket combines a dog clutch, which engages with a similar clutch formed on the inner end of the sun-wheel. The sun-wheel has also a dog

clutch on its outer end, which is capable of being engaged with a similar dog clutch by sliding the sun-pinion outwards (see illustration). This dog clutch is anchored to the bicycle frame by a clip, and passes through the centre of the internally-toothed driving pinion.

The high gear is obtained by sliding the sun-wheel inwards away from the belt rim, when it engages with and becomes solid with the driving clutch member and the bracket carrying the planet pinions.

These latter mesh both with the sun-wheel and the outer ring, and since they cannot move, the drive is conveyed direct through them without any reduction in gear.

To get the low gear the sun pinion is moved out towards the belt rim, when it engages with the dogs of the anchored shoulder. The planet pinions can now rotate, and the drive is communicated to the clutch by the outer toothed ring revolving the planet pinions about the fixed sun-wheel, when they carry around with them their bracket. A spring normally holds the sun pinion in such a position that the low ratio is in operation; the high gear is therefore held in with a ratchet, and is actuated by throwing forward the change speed lever. The method of anchoring the fixed dogs to the frame relieves the spindle of twisting strain.

The gear control is on a quadrant fixed to the top tube of the frame. The lever is of sensible strength and size, and the ratchet large enough to stand any amount of hard wear.

The Lukin Carburetter.

The Lukin single lever carburetter, a very neat carburetter on entirely novel lines, has been invented by Lukin, Ltd. It is being manufactured by Peck and Co., Ltd., the well known water meter makers of London, and was shown and is being marketed by the Service Co., of 292, High Holborn, W.C.

The principle of this carburetter is ingenious, and its action extremely simple, there being only one moving part.

Referring to the section published herewith, it will be noticed that the petrol is fed by a float device of the usual type to a jet K, which has two very small orifices. From K the petrol flows to the control chamber E, whence it passes through three small holes F to the mixing chamber G, being completely atomised on the way. The jet is surrounded by a tube having at the bottom a plate B, in which ports are formed for the admission of air; owing to the peculiar construction of the carburetter these ports also act as a throttle. At the top the walls of the tube are belled out, forming

The Lukin carburetter showing single control lever.

the mixing chamber E and carrying the plate H, in which ports are formed. Above this lies the stationary plate I, in which are cut corresponding ports.

The action is as follows: When the lever L is rotated it carries with it the plate H and the tube and base plate B, so that as the ports A are uncovered by the plate B (thus opening the throttle), the ports H are covered by the plate I, thus, by cutting off the air from the jet, increasing the suction effect. The converse is obvious, but an important feature of this carburetter is that after shutting the ports A the control lever still has a certain amount of negative movement, by which the ports A can again be opened while the ports H remain open. Thus there is practically no suction on the jet;

Part sectional elevation of the Lukin carburetter.

but cold air is drawn into the engine through A, causing a scavenging action and also forming a brake. O and P are gauzes to prevent the ingress of dust or mud. Two simple adjustments can be made. First, by removing the pin at M the cap can be revolved slightly, thus altering the relative position of the ports H to the ports in I; secondly, the suction on the jet can be regulated by the admission of air through the central pin N.

The carburetter is very cleverly designed, and appears to be on the right lines. It combines simplicity and efficiency with a single lever control, and can be instantly altered to suit various types of machine.

The Villiers change gear lever and quadrant on top tube.

Show Cleanings.—

The 1912 2 h.p. Alcyon which was shown at Olympia last week by G. N. Higgs. —

Silent Chain Transmission.

An interesting machine was to be seen in the Gallery at Olympia on the stand of the Coventry Chain Co., viz., a $3\frac{1}{2}$ h.p. Singer with a silent chain from the engine to the counter-shaft and a roller chain to the back hub. This should make a most efficient transmission.

We are informed that 557 magnetos were exhibited last week, and of that number 541 were made and supplied by the Bosch Magneto Co.

A late arrival on the M.R. stand was a machine fitted with the new M.R. clutch and two-speed hub gear. This clutch is of the leather-covered cone type, and is engaged by rotating two inclined planes against steel balls, thereby pressing plungers against a disc, which forces the clutch outwards. The gear is a simple form of epicyclic gear, the high speed being engaged by means of dog clutches.

D.H.K. Hub Clutch.

The "D.H.K." free engine hub consists of an inner shell which has disc adjusting bearings running on $\frac{5}{16}$ in. balls. The shell is screwed at one end for the belt rim and at the other to take the pedalling clutch. In it is pivoted a lever which moves in a slot and projects up the interior of the barrel; inside is a cone which is pushed forward or pulled back by a phosphor-bronze plate operated by a pin working in a slot in the spindle. Over the inner shell is mounted the outer hub to which the wheel rim is spoked. This

hub is provided with phosphor-bronze parallel bearings, which fit on to the hardened and ground surface of the inner shell.

When the cone is pressed forward along the interior of the hub it depresses the

Belt side of the 1912 model $3\frac{1}{2}$ h.p. Norton.

lever and expands the phosphor-bronze band which engages with the recess on the outer hub, and consequently the hub revolves as one piece. When the cone is withdrawn the phosphor-bronze band forces the lever back into position, releasing the outer hub, thus the interior of the

hub, which carries the belt pulley, is free to revolve on the parallel bearings, giving a perfectly free engine. There are no springs of any kind, or even an extra ball race included in its manufacture.

It is made with two chain lines, $2\frac{1}{2}$ in. wide for heavy weights and 2 in. for light-weights. The larger size weighs just under 7 lbs. and the smaller just over 5 lbs. It is made by the D.H.K. Co., Ltd., 20, Mary Ann Street, Birmingham, and was exhibited on the Humber stand at Olympia.

Adjustable Pulley and Spring Handle-bar.

On the Lincoln Elk stand, Mr. Rey, of Hampstead, showed a sidecar, sold at a very moderate price, with which twelve months' guarantee is given. It is fitted with quickly detachable joints. Yet another interesting device is an adjustable pulley, the movable portion of which is provided with a stud, which engages with slots cut in the adjusting ring.

A spring handle-bar, known as Scott's, was exhibited by F. and H. Melen, Ltd., Sherlock Street, Birmingham. This is made in two forms. The handle-bar is pivoted about its centre, and at right angles to it are two arms, from which springs extend to each side of the vertical tube of the handle-bar, so that the latter may have a rocking motion. The other form is to attach a rod at the end of

Section of the D.H.K. free engine hub described on this page. It is one of the lightest and neatest of its kind, and may be fitted to Humber machines if ordered.

New design spring operated quickly detachable fastening used on the sidecar supplied by Maude's Motor Mart.

BRITISH MOTOR CYCLE RECORDS.

Compiled by A. V. EBBLEWHITE, Official Timekeeper to the Royal Automobile Club, Auto Cycle Union, and the British Motor Cycle Racing Club.

CLASS A. For motor cycles of which the cylinder capacity does not exceed 275 c.c.

A New Automatic Carburetter

THIS carburetter, which is manufactured by the Stewart-Precision Carburetter Co., Ltd., 199, Piccadilly, W., has proved its worth on motor cars, and is now being made suitable for motor cycles. Its advantages are simplicity and efficiency. As regards simplicity, there are only three moving parts—the float, the valve, and the throttle.

Referring to the sectional sketch, petrol enters at an orifice, which is closed by the needle valve A, and fills

the float chamber until the float B, which is of varnished cork, by rising operates the needle valve and closes the orifice. In the vaporising chamber D the descending piston creates a vacuum and causes the valve F (shown black in section) to rise from its seating E. As the valve is held down by gravity alone, the amount it will lift depends entirely upon the amount of air passing, so it must always assume a definite position in relation to the depression in the carburetter. In the illustration it will be noticed that the valve F is shown clear of its seating in the position it would assume when the throttle is fully

Section of the Stewart-Precision automatic carburetter.

open. This valve has a central passage through which the tapered needle H projects. This needle is attached by means of a pin to the screw J, so that it has a slight rocking movement to avoid any possibility of binding. The petrol is drawn through a central tube K, whence there is free egress into the vaporising chamber. At the same time air is drawn in through the main air ports L, and, passing up the passage marked M, follows the direction of the arrows and rushes at a high velocity past the jet, serving to atomise the spirit thoroughly. The throttle, which is of the piston type, is situated at P, and is kept closed by a coil spring and opened against spring pressure by the usual Bowden control on the handle-bar. The carburetter is claimed to be thoroughly constant in its action and to give an accurate mixture at all speeds. Naturally, the further

the valve rises from its seating the greater is the amount of petrol and air admitted.

It is interesting to note that in the interior of the valve there is always petrol up to the level of the float; in fact, slightly above it, so that there is always a head which can be drawn upon for starting, thus removing the necessity for flooding.

The air valve is kept from a tendency to jump or flutter (due to the intermittent pull of the cylinder or cylinders) by the "dash pot" action of the petrol at the lower end of the stem. There is a slight annular space left around the reduced part of the stem which allows just sufficient liquid to flow under the stem to permit a very slow movement, the valve, of course, being unable to rise faster than the speed at which the liquid can fill the space below the stem. The same petrol that acts to restrain the movement of the valve also forms a perfect lubricant for the stem, and as the stem only moves when the throttle is moved, very little wear can take place.

The only criticism we can offer is that the depth of the carburetter is rather against it, the space on the average motor cycle being rather limited.

The complete Stewart-Precision carburetter.

The new Sturmey-Archer three-speed gear fitted to a 2 h.p. Humber lightweight.

CURRENT CHAT

Smaller Stones for Street Gritting.

As the result of representations made by the R.I.A. with regard to the gritting of streets, a number of authorities are using smaller material for this purpose.

Reflex Rear Lights.

500 pedal cycles belonging to the police throughout the Metropolitan area are to be fitted with reflex rear lights. These lights have been presented to the Commissioner of Police by the Royal Automobile Club.

The Show.

Business generally was exceedingly good, many firms, notably the Scott, Triumph, Douglas, Zenith, P. and M., Morgan, and Clyno, having booked sufficient orders to last them for many months. Immediate delivery of the most popular makes of machines is now almost an impossibility, except through agents; we even heard of a £10 premium being offered on a Morgan runabout for delivery at the beginning of the New Year.

The Clyno Co. is arranging to manufacture 1,500 sidecar machines next year.

Most people attended the Show on Wednesday and Saturday. On those days it was difficult and in some cases impossible to examine any of the novel exhibits minutely owing to the crowds swarming on the stands.

Two or three papers included in their so-called "stand to stand" show reports machines which were not on exhibition. One journal referred to the new two-speed Triumph as "one of the features of the Show."

The Triumph magneto control, as we indicated last week, came in for an exceptional amount of criticism. Some did not favour it at all, and we heard of several orders being placed subject to handle-bar control being fitted.

The Autofrip was the funniest thing in the Show. Mrs. Kent, the inventor, never tired of explaining its advantages to the public.

Our "exposure" last week of the fact that a four-wheeled vehicle was in the Show led to the authorities demanding a notice being attached to the Humber railway inspection trolley pointing out what it really was!

Why is it that the Show exhibits of purely motor cycle manufacturers are so arranged that spectators can walk on to the stand and all round the machines to examine them closely whilst many cycle manufacturers, who are also makers of motor cycles, enclose their exhibits by means of rails, and so prevent a close inspection of what they have obviously staged solely for the purpose of criticism and inspection? There are exceptions, but this feature of the Show was quite

noticeable, and was freely commented on by motor cyclists. One excellent feature was that all machines were clearly marked with their respective horse-powers—a striking contrast with the cars at the Car Show, which, seldom, if ever, bore the horse-power figures.

We are often queried regarding the date of the manufacture of motor cycles, the owner or prospective purchaser only having a number to go by, which is usually stamped in small figures on frame and engine. The Rex Co. do not intend any doubt to exist in future on this subject regarding their machines, as we noticed at the Show the figures 1912 cast on various parts.

SPECIAL FEATURES.

SOLO MODELS AT OLYMPIA: A CRITICISM.

BRITISH MOTOR CYCLE RECORDS TO DATE.

THE LIGHT SIDE OF THE SHOW.

Purley and District M.C.C. Night Trial.

The winners of the 100 miles night trial, referred to in our club news pages, have agreed to divide the prize—a pair of butted tubes presented by Mr. A. Jago.

The T.T. Winner's Ambition.

Chatting with O. C. Godfrey at the Show, we learned that his ambition is to be the first motor cyclist to attain a speed of one hundred miles an hour, and a special machine is being built in the Hendee Manufacturing Co.'s works on which Godfrey hopes he will be able to accomplish his desire. Unfortunately, doctor's orders debar him from motor cycling for from two to three months.

Twenty-six Records in One Day.

Twenty-six world's records were broken on Tuesday last week, which is probably the biggest day's haul ever known. Haswell, Rhys, and Bashall shared the honours.

Next Year's Competitions.

The Herts County A.C. has booked no less than eleven dates for competitions in the 1912 fixture list, so that other local clubs must take a back seat.

Making converts at Olympia. The Premier and sidecar shown above took quite a number of ladies for trial trips in the vicinity of the Show.

Motor Cycles in London.

Up to September 30th last, 16,376 motor cycles had been registered with the London County Council since the Motor Car Acts of 1903 came into force.

"The Motor Cycle" Show Issue.

With records of all kinds in the air, it is worthy of note that last week's issue of *The Motor Cycle* contained the largest number of pages of any motor cycling journal ever offered to the public, and, what is more, the circulation of 65,050 copies constitutes another record.

Electric Generator Sets.

Now that electric generator sets are being introduced for motor cycle use motor cyclists will be interested to know that a complete set for a car with lamps front, side, tail, and a small inspection lamp for the dash costs as much as a good motor bicycle, viz., about £50.

Breaking Strain of a Belt.

The technical school attached to the Birmingham University were asked to ascertain the breaking strain of a Midland motor cycle belt, and they have reported that the belt did not give way until the instrument registered over a ton. Seeing that the maximum strain on a motor cycle belt is 250 lbs., this experiment shows what a great margin of strength is possessed by the average motor cycle belt and the Midland in particular.

Collision Case. £50 Damages.

A Manchester motor cyclist named R. G. Pool secured £50 damages last week at Manchester Assizes from a car driver named H. J. Naylor. The motor car was driven towards Mold from the Queens-Ferry end, and the motor cycle was travelling along the Flint Road towards Chester. The collision occurred at the cross-roads. The car owner's case was that the motor cyclist was not keeping a proper look-out, that he took the wrong course, and that owing to his speed he could not manoeuvre his machine properly. The jury thought otherwise.

A Scottish Appeal.

Mr. F. K. Dickson, a member of the Automobile Association and Motor Union, was convicted at the Kilmarnock Sheriff's Court for riding a motor cycle at a speed in excess of ten miles an hour, a fine of £2 10s. being imposed. The police evidence consisted of the testimony of two constables who timed the defendant over a measured distance of 220 yards, but who were standing together some fifty feet beyond the end of the measured distance. The constables swore that from the place where they stood they could judge to a nicety when the defendant entered the measured distance, and when he left it, notwithstanding that it was shown by both sides that there was a curve in the road, and that it was established in defence that the defendant must have been a number of yards inside the measured distance before he was visible to the constables from their point of observation. The case is one in which the conviction appeared to have been so largely against the weight of the evidence, and also wrong on points of law, that the A.A. and M.U. has decided to defray the expenses of an appeal to the higher court.

FUTURE EVENTS

- Dec. 9.—M.C.C. Annual Dinner at the Café Monico.
 26-27.—M.C.C. Winter Reliability Run to Exeter and back.
 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.
 30.—North West London M.C.C. Twelve Hours' Winter Reliability Trial.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

A Six Days' Sidecar Ride.

A motor cyclist named M. H. Butler, driving a 4 h.p. twin Minerva motor bicycle and Dunkley sidecar, has just started on a six days' ride, in which he intends to cover 2,000 miles if possible; the engine is fitted with the N.S.U. two-speed gear. Mr. Butler left *The Motor Cycle* Offices, 20, Tudor Street, E.C., last Friday en route for Edinburgh; it is his intention to post cards at frequent intervals informing us of his progress.

Gymkhana in Australia.

A motor show was held recently in Sydney, which proved very successful. In the afternoon and evening of the first day a series of competitions for both cars and motor cycles were held, the results of the latter being as under:

Novice race.—1, A. C. Searl (5 J.A.P.); 2, J. Challand (5-6 F.N.); 3, R. B. Archer (5-6 F.N.).

Obstacle race.—1, J. E. Yee (3½ T.T. Triumph); 2, F. Holmes (3½ T.T. Speedwell).

Speed race.—1, W. W. Reynolds (3½ Triumph); 2, A. C. Searl (5 J.A.P.).

Lifebelt race.—1, L. A. Esdaile (3½ Triumph).

Potato race.—1, F. Holmes (3½ T.T. Speedwell); 2, R. B. Archer (5-6 F.N.); 3, A. L. Maddocks (5-6 F.N.).

This is the first competition of its kind to be held in Australia.

Brooklands.

Lieutenant Smith, on a 3½ h.p. Singer, made an attempt on Friday last to beat the six hours' record. Though he travelled well for four hours he had eventually to give up through plug trouble.

Hugh Gibson goes to Oldham

Mr. Hugh Gibson, the well-known Southport motor cyclist and record holder, is to join the staff of Bradbury and Co., Ltd., Oldham, on January 1st, as chief competition rider and representative for Scotland and Ireland.

English-Dutch Reliability Trial.

The Dutch M.C.C. will organise an international reliability trial next August, twelve riders to represent each country. These twelve will be composed of six amateurs and six trade riders. Further details will be published shortly.

Olympia.

There were no less than 552 motor cycles exhibited at last week's Show, an increase of 159 compared with last year. Just over half, viz., 283 machines, had change-speed gears. Belt transmission was used on 456 machines. Further details appear on page 1334.

To the Show by Road.

A goodly number of motor cyclists visited the Show on their machines, and on Saturday there were two or three rows of motor cycles staged outside the main entrance to Olympia, including several passenger machines. About a dozen motor cycles at the Hammersmith Road entrance were available for demonstration and trial.

Unsightly Advertisement Hoardings.

The Roads Improvement Association is doing good work in connection with unsightly advertisement hoardings which also obstruct the view of traffic at corners and other dangerous places. The Surrey County Council, subject to Home Office sanction, has adopted the following by-law: "No advertisements shall be exhibited upon any hoarding, stand or other erection visible from any public highway, waterway, or railway, and so placed as to disfigure the natural beauty of the landscape."

P. Platt driving a 3½ h.p. chain-driven two-speed Bradbury, with four passengers (total weight 40 stones), up Rock Street, the steepest ascent in Oldham. The gradient is said to be 1 in 5.

A HIGH-SPEED MOTOR CYCLE RACING TRACK IN THE MIDLANDS.

A preliminary meeting, under the able chairmanship of Mr. T. W. Loughborough, was held at Olympia on Saturday last to discuss the advisability of building a racing track in Birmingham. The idea of the promoter, Mr. F. A. McNab, is to erect a "saucer" track two laps to the mile, and banked for a speed of 100 miles an hour in or near Birmingham. At an informal meeting Mr. McNab reported that about £50 had been promised. He suggested a limited company should be formed and that a 1s. fund should be started, the price of each share being 1s. Such a track, he said, would be excellent from a spectacular point of view, and a capital testing ground for makers. Mr. McNab proposed, and Mr.

E. M. P. Boileau seconded, that such a track should be built—a motion which was carried unanimously. The names of Messrs. P. Butler and T. W. Loughborough were put forward as hon. treasurer and designer of the track respectively, of which it was suggested Mr. J. H. Price be asked to take up the organisation. Among those present were Messrs. J. Slaughter, W. L. T. Rhys, Stanhope Spencer, George King, Roy Walker, H. Martin, H. A. and C. R. Collier, S. Wright, G. N. Higgs, N. D. Slatter, and B. A. Hill. It was decided to call a committee meeting in the Midlands at no distant date, when the question of furthering the scheme will be finally arranged.

The Evolution of Transmission.

By "IXION."

I AM a faddist above all things, but my latest fad is rather bigger than most of its predecessors; for after many years of devoted allegiance I have at last lost my faith in the belt drive as the one and only motor cycle form of transmission for time and eternity. I do not wish for one moment to imply that the belt is either moribund or deceased. I firmly believe that it will remain the most popular type of transmission for some years to come. But I do also believe that it will finally be ousted on all but the very cheapest machines by the enclosed chain, but that will not come about yet awhile.

Rapid Progress.

During the last two or three years first-grade motor cycles have made gigantic strides towards reliability, and for several seasons past my involuntary stoppages have been practically confined to belts and tyres. Tyre troubles, like the poor, we may expect to have always with us. The combined genius of the pedal cycle and automobile industries has failed to evolve a satisfactory unpuncturable pneumatic tyre; but these two industries, which are sisters of the motor cycle industry, have long since perfected no trouble transmissions. Who would buy a push-bicycle with a transmission that needed attention, perhaps, every 500 miles in dry weather, that sometimes completely failed to drive the rear wheel in wet weather, and that had to be scrapped and replaced at a cost of a guinea or so every 1,500 or 2,000 miles? Who would buy a car with a propeller-shaft requiring adjustment every 500 miles on dry roads, that slipped badly uphill when the roads were wet, and that wore out in a little over a month? The belt drive has undoubted merits—it is very sweet in running, it is very easily repaired and adjusted—but it also has grave faults. Anybody who competed in either the Scottish or Harrogate Six Day Trials this season will recall the frenzied adjustments at the foot of every bad hill, adjustments often repeated two or three times in as many miles when the roads were awash; and even the least experienced spectators commented freely on the festoons of spare belts with which the handle-bars were swathed. Surely we are only waiting for the chain drive to be perfected to adopt it as our standard.

I do not think I have yet sampled a chain drive as applied to a large single-cylinder engine which could compare with a good belt for sweetness of running; but I have certainly used chains on twin-

cylinder engines, large and small, from the 7 h.p. Indian to the $2\frac{3}{4}$ h.p. Enfield (to mention actual examples), which ran as nicely as any belt. There is no reason why a progressive industry should not before long provide us with encased chains, running in oil baths, fitted with a simple separate adjustment for each chain, and softened by an efficient shock-absorber in the drive. The Clyno machine shows that such a design does not necessarily imply inaccessibility. Such a drive would probably run up to 15,000 miles without replacement, and last at least 2,000 miles between adjustments. Here is an ideal for the trade to work towards. I am aware it implies rather heavier-built engines, and that a percentage of the lissom verve of the modern $3\frac{1}{2}$ h.p. T.T. belt-driven single may have to be sacrificed, but few care about that? The vast majority of future motor cyclists will not be zealots for the last veneer of speed, and they will plump for an inexpensive and troubleless transmission, which will not cause any more anxiety than, say, the reliable magneto machines with which our mounts are fitted.

EVERYTHING BUT THE MOTOR.

The nearest thing in push cycles to a motor cycle. Mr. Saville Brown, of Hull, whose cycle is fitted with wheel-steering, three-speed gear, three head lamps, mascot, rear lamp, and motor mudguards.

ANOTHER LIGHT QUAD.

A FRENCH-BUILT MACHINE WITH 7 H.P. WATER-COOLED ENGINE.

LAST week a very good example of what for want of a better term we will call a motor cycle quad car was shown to us. This is a type of vehicle for which there certainly seems a growing demand—something with four wheels and with side by side seating accommodation and at motor cycle price—and the vehicle we saw and tried was a good example of the species. In its general details, except in dimensions, it is a car in every sense of the term—pressed steel frame, water-cooled engine, Renault type bonnet, scuttle dash, two-seater body, etc., but it only weighs about 550 lbs.

The car in question has been designed by Mr. J. Averies, of Englefield Green, near Egham, Surrey, and has been built for him in France. In its arrangement it incorporates just those details which will appeal to the motor cyclist. For instance, the control is more suggestive of the motor cycle than the car.

The 7 h.p. single-cylinder engine has a bore and stroke of 90 x 130 mm. respectively (though it can be made of 87 mm. bore if required), water-cooled on the thermo-siphon system, which passes the water through Renault type radiators on the dash. This engine, which is very substantially constructed, is fitted with an automatic inlet valve, past which the charge is drawn from a Claudel-Hobson carburetter. At the front of the engine a high tension Bosch magneto is driven, and from a tank on the dash oil is dripped, past a sight-feed lubricator, to the crank case.

The Change-speed Gear.

At the back of the engine the crank case is extended to form a pit in which the fly-wheel and gear are placed, and the former is designed to take a leather-faced cone clutch, which is operated in conjunction with an epicyclic two-speed gear. This gear is so devised that for the low speed the case containing the planet pinions is held by a band brake, so that in transmission through the planet pinions the number of revolutions per minute is reduced in a way very similar to that employed for the gear of a lathe. In neutral both the band brake and clutch are out of action, while for the high gear the clutch

is put in, and the complete epicyclic gear, being locked, rotates solid with the flywheel. In the example inspected a reverse was not fitted, but we were given to understand that in future these vehicles will be fitted with a reverse.

From the gear the power is transmitted by propeller-shaft

to the final bevel drive on the rear live axle, the latter being neatly and strongly encased. The propeller-shaft has a plunging universal joint at the front practically on De Dion lines, and at the back we were informed that it was capable of sliding, as the shaft is surrounded by a torque tube, formed at its front end with U-shaped arms, and slung from the back walls of the flywheel and gear well so as to allow for the spring deflection. The final drive gives a reduction of $3\frac{1}{2}$ to 1, and as the low gear, as compared with the high or direct drive is 2 to 1, the ratio between engine and road wheels on the low speed is 7 to 1. The front axle is

made from a steel forging, so neat that it looked as if it had been produced from dies. Brakes, which can be operated through wire connections either by pedal or hand lever, act internally on drums secured to the rear wheels. The brake lever, when in the midway and "on" positions, through the medium of a cam action, holds the clutch out of engagement, but when the brake is off the clutch can be engaged as soon as the driver's foot is taken off the pedal.

A third pedal for the accelerator affords the means for governing the engine on the throttle. Steering, be it added, is of the worm and sector type, and so irreversible.

On the Road.

The vehicle we tried under varying road conditions appeared to have an excellent turn of speed, and an ample margin of power for all contingencies, doing about thirty miles an hour on the level with comparative ease. In fact, the runabout well deserved its name, for it is to be called "La Ponette," which when interpreted means "the pony."

It is a pity that there is no organisation to cater for light runabouts in the matter of competitions.

Three-quarter front view of the Ponette Quadcar which weighs only 550 lbs.

The single-cylinder engine of the Ponette Quadcar, showing the disposition of the magneto and radiator.

TAKING MOTOR CYCLES BY RAIL—A WARNING.

The L.B. and S.C.R. Co. summoned a motor cyclist at the Westminster Court, on Thursday last, for sending by rail a motor cycle the tank of which contained petrol. In the evidence it transpired that the defendant was asked twice at Victoria Station if the tank contained petrol, and in each case he answered in the negative and signed a declaration form to that effect. Subsequently the tank was examined and found to contain about a pint of petrol. The defendant's

plea was that he was under the impression that the tank was empty. The magistrate inflicted a penalty of £5 and 23s. costs, or two months' imprisonment. This penalty appears to us to be very heavy, considering the position of the defendant, who was described as a mechanic. It is certainly a serious thing to sign a declaration which is afterwards proved to be incorrect, but surely the punishment should fit the crime.

MOTOR Ladies

by Mrs. M.C. Cooke

CYCLES at Olympia

WHEN some six or seven years ago, ladies began to ride motor cycles and to ask that suitable machines might be built, manufacturers, with one or two exceptions, pooh-poohed the idea, and put it down to a craze which would soon die a natural death. But the movement is still alive, and very much so, as is evidenced by the number of open-framed machines exhibited at Olympia. Manufacturers are slowly but surely realising that there is a demand for this type of machine, and are acting accordingly, but those who were enterprising enough to study the question a year or two ago are now reaping the benefit of practical experience.

Some of the new models are really excellently suited to ladies' requirements, and show unmistakably that the makers have expended much time and careful thought in designing a machine to suit a woman's special needs, and have not attempted to palm off an adaptation of a man's machine, nor yet a pedal bicycle with an engine and other parts fitted as an afterthought.

The Range of Models.

Altogether about a dozen different patterns were exhibited, ranging in power from the lilliputian Moto-sacoche to its more powerful rival the 3¾ h.p. Scott. The last-named machine has been greatly improved from a man's point of view, but under its new 1912 garb is slightly too powerful, and withal looks too complicated for an inexperienced lady, though one could not help admiring the new side wings which must render it very clean to use. I am constantly told that the great point insisted upon by prospective lady motor cyclists is "cleanliness." Granted that this is an important point, I cannot agree that it is the most important. Ladies cannot expect to motor cycle in white skirts yet. I am afraid we must make up our minds to put up with a certain amount of dirt. Even when riding a push cycle we cannot keep absolutely spotless, and yet we do not refrain from cycling for that reason; and if we *must* undertake a muddy ride, well, we can cover the distance much more quickly on a motor bicycle.

Dressguarding.

With regard to the possibility of the dress coming in contact with the engine or driving mechanism, I think this danger is greatly exaggerated. Many makers have completely covered in all the mechanical parts to guard against any likelihood of spoiling one's clothes. So much so in fact, that more work is involved in removing shields if anything should go wrong—and trouble is not unknown as yet! I am aware that a special point is made of the ready detachability of some shields, but there are others which necessitate much fiddling. One model I noticed had five wing nuts to unscrew before one side could be

removed. Personally, I prefer to see some of the mechanism of the machine I ride, and I consider an engine guard such as is fitted to the Humber and Centaur models—and some other similar fitment for the carburetter—is quite sufficient to amply protect the dress. The small shields shown on the Enfield and Matchless machines answer the same purpose, and either of these looks prettier than a large shield.

I have a great dislike to the corded dressguard which is still fitted to several machines. Everyone knows how very dirty the cord gets on a pedal cycle, how difficult it is to clean satisfactorily, and how soon it gets chafed and ragged looking. How much more so on a motor bicycle! Some makers—notably of the Douglas, Enfield, Humber, and Centaur—have entirely dispensed with it, and have substituted a metal guard which is neater and much more efficient.

The Simplicity of the Control.

As regards driving, surely nothing could be simpler than present-day methods. The most perfect ignoramus could be initiated into the mysteries of the different levers in a few minutes. And then how little there is to go wrong! The ignition is scarcely given a thought in these days of reliable magnetos—it is always ready—one filling up with petrol will take a light or medium weight considerably over a hundred miles, and now the latest models are being fitted with drip feed lubricators which oil the engine automatically. Really we shall soon have nothing to do but sit on the machine and steer!

That reminds me I want to say a word about the handle-bars. The inverted lever seems to be out of favour on ladies' machines, with the consequence that the grips on the handle-bars are smooth and straight on many models, notably on the Douglas and Moto-sacoche. Would it not be as easy to fix grips with a curved hook at the end? It would add greatly both to the comfort and safety of the rider without detracting in the slightest degree from the appearance of the machine.

The new open frame 2 h.p. Quadrant.

Ladies' Motor Cycles at Olympia.—

Now to take the Show machines in detail. There are several old friends, some, however, with new faces, notably the Motosacoche, Douglas, Matchless, etc. These have all been perfected, and are already well known. The last-named is, I believe, rather a favourite in the colonies, where it appears in a slightly different form. It is a very serviceable-looking mount.

The 3½ h.p. lady's pattern Midget Bicar.

The Motosacoche is *the* lightweight, and is noted for its cleanliness. It is pretty in outline, very low built (24in. wheels), and every part is well protected. All the moving parts are controlled and regulated from the handle-bar—both brakes, throttle, gear, etc. At the first glance, the number of levers is rather bewildering, and I am afraid it would take a novice some time to remember them all, but it is an ideal machine for pottering about, visiting, shopping, etc., and that is the average lady's requirements. By means of its variable gear, it can surmount quite steep hills.

The Douglas, I believe, enjoys the distinction of having the greatest number of patronesses on the road. It has now, among other improvements, been fitted with an engine foot-starter in place of the handle. It is a pity this is on the left side rather than on the right. The dressguard for the back wheel is particularly neat, and worthy of note. The oiling arrangement is also excellent.

There are several newcomers, all of which embody some excellent features. The Humber and Centaur—identical in design—may be characterised as excellent mounts for beginners. They are fitted with pedalling gear, and may be had either with or without the Armstrong three-speed gear and clutch.

The Enfield is an exceedingly pretty machine, and looks very dainty in its delicate grey dress. Although not fitted with pedals, it is a very handy machine, and can be started very easily. It has a very sweet, even, drive.

The Little Levis Two-stroke.

The Levis open frame attracted a large amount of attention. It is quite unique in its design, and it will be interesting to see how ladies appreciate it.

The Hobart needs no introduction, for this machine has been on the market for some time.

The Forward, seen for the first time at the Show, is fitted with a twin engine completely covered up with the exception of the plugs, which appear through holes formed in the shield just where the

dress falls. I noticed this in a twinkling, for I have lively recollections of an uncovered plug on my Triumph! Every time my wet mackintosh touched it the current was diverted, very often passing into the coat and giving me a sudden electric shock, at other times bringing me to a standstill for no apparent reason. A little fitment on the end of the high-tension wire soon remedied this.

The Quadrant and the Singer are both workmanlike machines, and being turned out by such well-known and experienced firms is a guarantee of their excellence. A feature of the Quadrant which strongly appealed to me was the saddle. More of this anon.

A Notable Absentee.

I was greatly disappointed at the absence of one of the lady's single-cylinder heavyweights, namely, the 3½ h.p. open frame Premier. The makers were not able to get it through in time for the Show. This was rather a pity, as a fairly powerful and fast machine, despite its weight, presents many attractions to experienced riders. I have no doubt it will be an excellent mount in its class, as I know a little of what Premier engines are capable.

A word with regard to accessories. When shall we see a suitable lady's saddle designed and marketed? I, for one, would hail with joy its advent.

I am glad to see that we are being catered for by the clothing manufacturers. The Service Co. were showing an excellent selection of patterns of materials, and also made-up garments. The material "Autoclos" is worthy of special note. It is a soft, pliable cloth, and is warranted rainproof, dustproof, porous, unshrinkable, and untearable. Costumes are shown for walking and cycling (among these an excellently designed divided skirt is conspicuous), and also some special styles in coats. The motor cycle coat has been designed to give the acme of comfort as well as protection.

From a lady's point of view, the Show was most interesting and instructive, and attracted crowds of the fair sex each day, many utter novices, who examined with beating hearts the different models; and blushed as they accepted an invitation to try the riding position.

In conclusion, manufacturers are to be congratulated on turning out such an excellent display of machines. There was never such a fine selection appealing to ladies, and the only difficulty now is to make a choice.

Lady's model 2½ h.p. Singer lightweight, which has very efficient dressguarding.

SHOW STATISTICS.

By H. HEWITT GRIFFIN, Fellow Royal Statistical Society.

IN *The Motor Cycle* of December 1st, 1910, an elaborate table was published (page 1205) showing, under twenty different heads, the entire exhibits of sixty-two firms. Motor cycles have now so settled down that many of these classifications, however useful at the time, are now unnecessary, such, for instance, as "Spring Forks." Who dare fit a rigid fork on a rigid frame touring machine in 1911? Yet there were twelve who did so last year.

Change-speed Gears.

What will occasion the most surprise is the large number of variably geared machines. *The Motor Cycle* campaign in favour of the change speed gear, which was instituted six years ago, has gradually but surely brought forward the necessity for an emergency gear for the go-anywhere-all-weather machine. Few would have guessed that there was an almost equal number of single and variably geared machines of the 552 exhibited.

Single v. Multi-cylinder.

401 single-cylinders and 151 twins and four-cylinders will cause no expression of astonishment. Many large firms who specialise on single-cylinder machines have not yet commenced experiments with twin-cylinders, but in the opinion of many experienced engineers twins are bound to receive more attention sooner or later, though, strangely enough, the proportion of twins is less this year than last.

Transmission.

There is an impression abroad that chain transmission has made great headway of late, but the total of 76 chain drivers appears small beside the 456 with belt drive. It should, however, be noted that some machines have combined chain and belt drive. In such cases, the belt only, being the final drive, is included in the statistics.

Short as is the table we now publish, it represents a lot of work. In the first place, the score sheets had to be prepared; then each one of the 552 motor cycles examined for the needed particulars. It will be seen that there is a splendid increase of over one-third more machines, while they were shown on eighty-nine stands against sixty-two last year.

ROTARY PETROL ENGINES.

A GOOD many readers of *The Motor Cycle* are under the impression that the rotary form of engine for motor cycles is an entire novelty. That this is not the case is proved by the fact that an old illustration of a rotary engine fitted in the back wheel, and made in 1896, was published in our columns on May 19th, 1910, in connection with an article respecting the Gnome engine and its possibilities in connection with motor cycles.

The latest suggestion for a two-stroke rotary engine has been sent us by Mr. E. Dobson, of North Kensington, and we reproduce herewith sketches of the idea. The Barry revolving engine was another promising design which was actually made and exhibited at the Stanley Show some years ago, and has, we know, been used on the road, but little or nothing has been heard of it lately. The latest model of the Barry was a four-stroke engine, but the original design exhibited at the Stanley Show was a two-stroke engine with four cylinders, two being working and the others pumping cylinders. We imagine that if this type of engine were successful its inaccessibility when fitted in the rear wheel would be against it as a commercial proposition.

The sketch shows a four-cylinder rotary motor with slide valves operated by the connecting rods. The advantage claimed for this is that it dispenses with crank case compression, and

measures the correct quantity of gas for displacement of the exhaust. It will be noticed that there are four explosions to each revolution of the engine, and its torque equals a four-stroke single-cylinder engine

**A Rotary Two-stroke Engine.**

geared 8 to 1. The free engine position is obtained by releasing the band brake on the crankshaft.

CLUB SECRETARIES AT OLYMPIA.

Relations with the A.C.U. Discussed.

Fixture List for 1912.

A REPRESENTATIVE gathering of club secretaries met at Olympia, on Saturday evening last, to draw up a fixture list of events for 1912. Previously, however, the Bradford M.C.C. had called a meeting to discuss the attitude the clubs should take up with the Auto Cycle Union, and before the fixture list came under discussion the following resolution, passed at the previous meeting, was debated upon before Mr. Robert Todd, the A.C.U. chairman: "That every affiliated club should be entitled to direct representation on the General Committee of the A.C.U. to the extent of one vote, and that a body of thirty London motor cyclists be elected by clubs to receive their proxies, and to carry plural voting powers to the extent of the proxies received by them." The matter was discussed at great length, but the gist of it all was the old story that the clubs had not fair representation on the A.C.U. Committee. (At present the constitution of the committee is as follows: Twelve members of the R.A.C., twelve of the private members, and twelve representatives of affiliated clubs—twenty-four against twelve. It must be pointed out, however, that only about four members of the R.A.C. attend regularly.) That the A.C.U. devotes too much time to competitions and too little to the welfare of its members. As the matter was clearly put by Mr. Perryman (Birmingham M.C.C.), the local clubs had no desire to break away, but they did insist on being fairly represented on the committee. Mr. Carty (Liverpool A.C.C.) urged that the solution lay in the A.C.U. working up the centres, of which he said only two—the Northern (the N.E.A.A.) and the Midland—were at all alive. The centres should entirely rule their districts, and each club

should have its vote, and each centre should send a representative armed with the votes of the clubs affiliated to that centre. Mr. Carty, though in this speech he took up a fair and reasonable attitude towards the A.C.U., in a subsequent oration went "all out" against the governing body.

An Amendment.

Eventually Mr. Brooker came to the rescue with an amendment to the effect that "The whole of the clubs forming the Auto Cycle Union should elect thirty representatives to serve on the General Committee, these thirty representatives to be approved by the whole of the clubs." This resolution was certainly a step in the right direction, as, although it did not give the clubs quite all they wanted, it placed them in an advantageous position, giving them an increase of eighteen representatives on the committee, six more than the total number composed of the R.A.C. and private members of the A.C.U. The amendment was put to the meeting and carried, but on being put as a substantive proposition it was lost. Seemingly, therefore, the meeting was an abortive one. But it is to be hoped that its effect will be more real than apparent. In addition to several members of the A.C.U., the following clubs were represented: Birmingham M.C.C., Scarborough and District, North Middlesex, the Motor Cycling Club, the N.E.A.A., Oxford, Cumberland, Derby and District, Walthamstow, Putney, Western District, Oldham, Worcester, Surrey, Mersey, Lincolnshire, Nottingham, Ilkley, Coventry and Warwickshire, Bradford, N.W. London, Edinburgh, and Essex M.C.C.'s, B.M.C.R.C., Sutton Coldfield, Manchester, and S.E. London M.C.C.'s.

OLYMPIA. A general view of the Main Hall during the progress of last week's Show.

Meeting of Club Secretaries at Olympia.—

1912 Fixtures.

By the time the foregoing discussion had been brought to a close very few secretaries were left to attend to the fixture list for 1912. This list stands as follows:

- Jan. 13.—Winter Trial, Derby and District M.C.C.
 „ 20.—Herts County Open Trial.
 „ 20.—A.C.U. Annual Dinner.
 Mar. 2.—A.C.U. One Day Open Trial.
 „ 23.—B.M.C.R.C. Race Meeting.
 „ 23.—Open Trial, Herts County M.C.C.
 „ 23.—Streatham and District M.C.C. Speed-judging Competition.
 „ 30.—Derby and District Open Hill-climb.
 „ 30.—Herts County M.C.C. Members' Hill-climb.
 Apr. 5-8.—N.W. London and Herts County M.C.C. Joint Trial and Open Hill-climb (Yorkshire) and Ladies' Competition
 „ 6.—M.C.C. Land's End and back.
 „ 8.—Scarborough and District M.C.C. Hill-climb Staxton.
 „ 8.—Westmorland M.C.C. Open Hill-climb Shap Fell.
 „ 13.—Oxford M.C.C. Open Hill-climb.
 „ 20.—Streatham and District Members' Hill-climb.
 „ 20.—B.M.C.R.C. Race Meeting.
 „ 27.—Bristol M.C.C. Open Hill-climb.
 May 4.—Herts County M.C.C. Hill-climb.
 „ 4.—Coventry and Warwickshire M.C. Open Trial.
 „ 11.—B.M.C.R.C. Race Meeting.
 „ 11.—M.C.C. Members' Hill-climb.
 „ 11.—N.W. London Run to Coventry.
 „ 11.—Herts County M.C.C. Open Speed Trials.
 „ 18.—Streatham and District M.C.C. Open Speed Trial.
 „ 24-27.—Herts County Touring Competition in Ireland.
 „ 24-27.—M.C.C. London to Edinburgh Run.
 „ 27-28.—Bradford M.C.C. Open Trial to Dunbar and back.

- June 8.—Ilkley and District M.C.C. and Bradford M.C.C. (joint) Open Hill-climb.
 „ 8.—Streatham and District M.C.C. Members' Reliability Trial.
 „ 8.—N.W. London Thomas Challenge Cup Trial.
 „ 15.—Nottingham and District M.C.C. Open Trial.
 „ 15.—B.M.C.R.C. Race Meeting.
 „ 15.—M.C.C. Team Trial for *The Motor Cycle Challenge Cup*.
 „ 15.—Herts County M.C.C. Amateur v. Trade Competition.
 „ 22.—Essex M.C.C. Gymkhana.
 „ 22.—N.W. London Members' Hill-climb.
 „ 29.—B.M.C.R.C. Race Meeting.
 July 6.—Herts County M.C.C. Scouts' Day.
 „ 6.—M.C.C. Race Meeting.
 „ 6.—Streatham and District M.C.C. Members' Hill-climb.
 „ 18.—Taunton and District M.C.C. Open Hill-climb.
 „ 20.—B.M.C.R.C. Race Meeting.
 Aug. 2.—Bristol M.C.C. Open Twenty-four Hours' Reliability Trial.
 „ 3-5.—M.C.C. Devon Tour.
 „ 5.—Cumberland M.C.C. Open Trial.
 „ 4-6.—Dutch International Reliability Trial in Holland (Provisional).
 „ 10.—B.M.C.R.C. Race Meeting.
 „ 12-17.—A.C.U. Six Days' Trial.
 „ 31.—Coventry and Warwickshire M.C. Open Hill-climb.
 „ 31.—Essex M.C.C. London to York and back.
 Sept. 1.—Streatham M.C.C. Open Hill-climb.
 „ 14.—B.M.C.R.C. Race Meeting.
 „ 21.—Herts County M.C.C. Open Hill-climb.
 „ 28.—Ilkley and District M.C.C. Members' Speed Trial.
 Oct. 5.—Herts County M.C.C. Members' Hill-climb.
 „ 12.—B.M.C.R.C. Race Meeting.
 „ 26.—A.C.U. One Day Trial (Open).
 Dec. 26-27.—M.C.C. Winter Run.

BROOKLANDS ACTIVITIES.

ON Tuesday last week Brooklands was the scene of two successful attempts at long distance records, first by W. L. T. Rhys on a Rudge, followed an hour later by J. R. Haswell on his Triumph, who set out on a 200 mile record ride. At the end of three hours Haswell stopped. Rhys had just beaten the four hours' record, 225 miles 151 yards, and he happened also to pull up and to mention to Haswell that he had beaten his four hours' record. This stirred Haswell to greater deeds, and he immediately mounted his machine and raised the four hours' distance to 239 miles 947 yards.

Haswell was inside record at two hours, in which time he covered 124 miles 258 yards, British record for any size engine. In three hours he traversed 184 miles 1,388 yards; in four hours 239 miles 947 yards. His time for 150 miles was 2h. 26m. 34s., and for 200 miles, 3h. 14m. 46s. The last four are world's records for any size engine. In the case of Haswell's Triumph, the silencer difficulty was over-

come by braunching the exhaust pipe and leading the two branches to separate silencers on each side of the chain stays. Rhys, having lost the four hours' record, succeeded in beating the five hours, in which time he covered 268 miles 154 yards. In six hours he rode 322 miles 603 yards. He also succeeded in beating the 250 miles record, time 4h. 38m. 54s., and the 300 miles 5h. 35m. 11s. These are world's records for any size engine. The weather was cold and fine.

New Sidecar Record.

On the same day J. T. Bashall established an hour Class E sidecar record with a twin Bat-Jap 85 x 85 mm. and sidecar, covering 45 miles 639 yards. The speed of his fastest lap was fifty miles an hour, and that of his slowest thirty-six miles an hour. The combination, which ran consistently throughout, weighed 324 lbs. and with passengers 647 lbs. The tyres were 2½ in. Hutchinson's and the belt a Lyso. The times were taken by Mr. A. V. Ebbelwhite.

TYPES OF SILENCERS NOW USED AT BROOKLANDS.

1. Method of silencing L. Smith's 3½ h.p. Singer by means of an expansion chamber. 2. System of silencing the exhaust on Stanhope Spencer's racing Rudge which is found to be most effective.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Clothing.

Q. Will you kindly advise me on the following points? I am anxious to obtain the very best jacket for all-round motor cycle work, one that is impervious to rain and wind, but I do not wish to have a mackintosh unless necessary. Would an Irish frieze lined with leather be equally serviceable?—O.V.T.

Irish frieze lined with leather would do, but nothing is absolutely waterproof except paramatta (when it is new) and oilskin (always). Irish frieze, leather-lined, would be warm, and would stand a considerable amount of rain, though it certainly holds dust.

Cost of Running a Motor Cycle.

Q. I am a probable buyer of a second-hand 1911 $3\frac{1}{2}$ h.p. two-speed mount with sidecar for passenger and child, but not being blessed with a superfluous amount of the necessary essential for motoring—money—I am desirous of running the machine at the least possible expense, with the greatest possible pleasure. I estimate my season's mileage to be about 2,500 miles, which will be run in the six summer months only. As I am an engineer with a considerable knowledge of petrol engines, I shall be able to undertake all ordinary repairs myself, and be able to keep the machine on my own premises, thereby keeping it in the best possible running condition, and shall always ride with the greatest consideration, placing reliability before speed. The mileage given would be over average roads with a fair proportion of hills. Your advice on this subject will be greatly appreciated.—E.L.P.D.

It is not possible to answer your questions definitely, as so much depends upon the driver and the machine. We have recently published letters on this subject, which show very different results. For the distance named you will require approximately the following: Driver's licence, 5s.; Inland Revenue, £1; registration, 5s. (this is not a yearly charge); petrol, £2; lubricating oil, 15s.; new cover for back wheel, say, 45s.; repairing outfit, 3s.; belts, 35s. You should be able to run from seventy to eighty miles per gallon of petrol, and a quart of oil should last between 200 and 300 miles.

A good deal more is required for sidecar work than solo. The covers on the front wheel and sidecar wheel should last about two years, but with tyres it is the pace that kills, and much depends, too, on the alignment of the sidecar. We have not included depreciation or any clothing.

How to Run Slowly.

Q. I have a $2\frac{3}{4}$ h.p. machine, Kerry engine, new 1911 B. and B. carburetter and 1911 Bosch magneto. The engine starts most easily with one push on the pedal, climbs hills, and accelerates beautifully. I was told it would run as slowly as five miles per hour. (1.) I cannot go slower than about 10 m.p.h., spark well advanced, throttle as little open as possible, and extra air just open. (2.) At above pace hardly any extra air can be given without causing misfiring and stopping engine. (3.) At higher speeds the extra air lever can never be opened as wide as throttle.—K.G.L.

(1.) You might manage to run a little more slowly if you close the air, shut the throttle still further, and do not advance the spark. (2.) We do not wonder that no extra air can be given

without stopping the engine. At very slow speeds the air should be excluded altogether. (3.) If you fitted a larger jet you would be able to attain high speeds and use the air lever to its fullest extent.

Lining on Tanks, etc.

Q. I shall be much obliged if you could give me a tip for painting the tank on my motor bicycle. I intend having an aluminium background with either red or green panels. I have already painted it with aluminium paint, but my difficulty lies in getting the lines of the panels perfectly straight. Are, by chance, stencils sold for this purpose, or perhaps some type of transfer would have the desired result?—R.J.D.

We regret we cannot help you. The only person who can is a man who makes a practice of doing nothing else but painting tanks. The lines are done by a special sable brush with long hairs, and their exact width and straightness depend entirely upon the skill of the operator, who draws "freehand." Sometimes he steadies his hand by running his little finger along the straight edge of the article he is lining.

AT OLYMPIA. Roe two-seater pleasure tricycle with the engine (a $4\frac{1}{2}$ h.p. Precision placed vertically in the frame.

Curious Experiences with a Magneto.

I am only a novice at the game, and candidly admit the magneto is a bit beyond me. I have had no trouble with mine, and have, in consequence, never seen one in bits, but recently I have had an argument with a friend of mine, and I would much like you to settle the point for me. I do not know if I can quite put in question form what I want to know, but it resolves itself into something like this. Is the spark of a magneto stronger the farther it is retarded? I have frequently noticed lately that after starting my machine and getting nicely on the way at about 20 m.p.h. I want to increase my pace a bit, and open my gas lever a little, but with no apparent result. The spark is now fully advanced, and the road fairly level. Without touching my air lever I retard the spark one or two notches and the result is obtained immediately. Is this as it should be? My friend argues that it is not. From my own experience it is. The magneto is a Bosch DA2 1910. I had a "blind" with another friend one night, and he did forty-five by speedometer, and could not catch me, and I found then the stronger the mixture I was running on the further I wanted my spark retarded to get the best result. I may add I am riding a 1910 Triumph, with the maker's own carburetter, and have done about 5,000 miles during the last twelve months.—H.T.B.

Your experience is certainly unusual. Are you sure you are not advancing the spark instead of retarding it? The spark of a magneto is stronger the more it is advanced, or rather, to be more correct, the faster the armature revolves. Actually, the strongest spark is obtained at the maximum point in the revolution of the armature, and this is usually arranged to take place when the lever is advanced almost fully. In the case of a Bosch or any other high tension magneto machine used with a single-cylinder engine, there are two maximum points, but only one is used, namely, the one at which the contacts break when the ignition lever is in a certain position, usually about two-thirds advanced. You will readily understand that if the break

occurs at a point when the lever is fully retarded it occurs at a point that is not the maximum point, and, in consequence, the spark is weaker. It all depends upon the timing of the spark. If you have related your experiences correctly, the magneto is obviously timed too fast and should be altered. See "Motor Cycles and How to Manage Them." The magneto lever is usually set so that it should be fully advanced for speed on the level, and retarded at the most a couple of notches, say one-sixteenth to one-eighth of an inch for climbing an extremely steep hill. When the machine is running all out, we often find that the mixture has to be slightly increased in strength; that is to say, the air lever will not stand being quite so far open, but we never find this occurs until the engine begins to overheat.

A Home-made Runabout.

I am thinking of building a four-wheeled vehicle somewhat after the style of a runabout, and should be glad if you could answer the following questions. The vehicle is to carry usually two passengers, total weight about 28 stones, with occasionally perhaps light luggage: (1.) Water-cooled and m.o.i.v. engine is presumably best. What should the horse-power be, bearing in mind that my district includes the most hilly part of Derbyshire; also within what limits should the engine horse-power be kept to come under the cheapest inland revenue charge? What is this per annum? (2.) Would 26in. x 2½in. tyres be good enough, and should these be steel or rubber studded, or both on all wheels? (3.) What gear ratios should be used? I am thinking of using a shaft drive, with an epicyclic gear, two speeds, and reverse. (4.) What would you advise, worm wheel or bevel drive? (5.) Could the framework be built up of cycle tubes and of what diameter and gauge should they be? (6.) What firm could you recommend for supplying the tube and angles, etc.? My main object is not so much speed as thorough reliability, and ability to go anywhere, up any hill.—E.H.M.

(1.) We agree that a water-cooled engine with mechanically operated valves is preferable. The horse-power should be some-

thing between 5 h.p. and 8 h.p., preferably the latter, but if you have to consider the cost of the local taxation licence the maximum should be 5 h.p. (to be covered by a two guinea licence). (2.) We should recommend 650 x 65 car tyres on the back wheels. One or both tyres should be studded. (3.) We should recommend a top gear of 5 to 1. (4.) Both are quite satisfactory and reliable. (5.) Yes, the frame should be built of cycle tubing. We should advise you to communicate with the Chater Lea Manufacturing Co., Ltd., 116, Golden Lane, E.C., who would tell you the correct gauge and supply parts.

Misfiring at Speed.

I should be glad if you would explain the following: I am troubled with misfiring at speed when rushing a hill with spark fully advanced and throttle open. When running on the level with spark fully advanced and throttle almost closed, there is not a single misfire. The same thing occurs, only the misfiring is worse, when running the engine on the stand; in fact, it will not fire regularly at all with throttle fully open. I fancy when the engine is running on the stand that a fine spray is being forced out of the extra air inlet. Machine 1906, automatic inlet valve, accumulator.—W.B.

The trouble seems to be that you cannot get enough air at high speeds. You should either try a larger choke tube or a bigger air orifice to the carburetter. Before making any alteration you might experiment with a smaller jet. Also try a stronger spring on the inlet valve. There is always a certain amount of blow back.

EXPERIENCES WANTED.

"J.T.B." (Derby). Bedelia runabout, belt transmission, power, noise, and consumption: also Lomax detachable non-skid hands.

"E.F." (India). T.A.C. for sidecar.

"A.M.S." (Ireland). P.V. spring-frame and 3 h.p. twin J.A.P. engine.

"J.W." (Stafford). Humber 5½ h.p. or other equal powered runabout.

"X.Y.Z." (Milford).—B. and B. variable jet carburetter used on twin light-weight.

SIDECARS AT OLYMPIA.

1. The new 3½ h.p. Brown sidecar combination. As will be seen, this machine is fitted with Bowden two-speed gear and kick starter.
2. The 1912 three-speed Kynoch-Precision and sidecar.

**MOTOR
CYCLE**

“Riding on Air.”

The Pleasures of Motor Cycling are fully appreciated when riding an A.S.L. motor cycle. You can travel all day, over the roughest of roads, without feeling the least fatigued. The machine can be ridden in any traffic or country without removing the hands from the handle-bars. The top lever controls the ignition, the middle the extra air, and the lowest the throttle

**“Riding
on
Air.”**

The following is but one of many testimonials we constantly receive testifying to A.S.L. efficiency. “I have great pleasure in writing to you to express my satisfaction with your **Air Spring Frame Motor Cycles**. I have ridden one of your machines during the whole of the past season, and I may say that I have not had a more comfortable mount. In fact, it is as comfortable, if not more so, than a well sprung car. After spending two periods of 22 hours each in the ‘saddle,’ which you will agree was a pretty severe test, I did not feel the slightest riding discomfort. Again expressing my satisfaction and wishing you every success.”

HARRODS WILL SUPPLY ANY STANDARD MAKE OF MOTOR CYCLE ON THEIR UNIQUE AND EASY SYSTEM OF DEFERRED PAYMENTS.

Briefly, the system is as follows:

One-fourth of the purchase price is payable on delivery, the balance being paid in equal monthly instalments. Harrod's clients thus have the full use of the machine from the date of first instalment, and enjoy its use while paying for it out of income without having had to disturb capital.

CORONET SIDE CARS

ONE MINUTE REQUIRED.

CORONET SIDECARS are all fitted with our improved QUICK DETACHABLE JOINTS, and can be detached in one minute.

LESS POWER REQUIRED.

In consequence of the unique design of frame in the "CORONET," less power is required to drive, compared with other sidecars.

MODEL C.—£7 2s. 6d.

MODEL A.—£3 10s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Excellent upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing topside about this attachment.

Delivery from stock to suit TRIUMPHS, N.S.U.'s, REXES, P. & M.'s, BRADBURY'S, etc. Discounts to Agents.

Proposed Abolition of the Cut-out.

THE proposed abolition of cut-outs is a matter which commands the serious consideration of both riders and makers of motor cycles, and, as a proof that the authorities intend to enquire into the matter thoroughly, we refer readers to the account of an examination of motor cycles by a Local Government Board official which took place last week. There is no cause for immediate alarm, as we understand owners and makers will not be called upon to make alterations at once to existing models. Special regulations will doubtless be issued before very long, and although we have no exact information, it is quite possible they will take the form of a definite area being specified for the final exhaust exits, varying according to the cubical contents of the engine. What we think should not be overlooked in connection with cut-outs is that, although in many instances they cause an engine to be excessively noisy, they are in some cases fitted to enable noise to be reduced, *i.e.*, the silencer is constructed to allow a fairly free passage for the gas, and a cut-out enables the area of the final exhaust exit to be very much reduced. Every motor cyclist knows that, with a cut-out of the kind referred to, he can render his engine so inaudible that the clicking of the valves alone can be heard. Had every rider used a cut-out with discretion, we do not believe there would have been any complaints, but it is the indiscriminate use of the cut-out by a certain section of the motor cycling community which has brought about the present enquiry.

There is only one possible excuse for driving with the cut-out permanently open, and that is when a comparatively low powered machine intended for solo

use is employed to haul a sidecar and passenger.

Another item that should be remembered is that the craving for greater power and speed has resulted in knowledge gained on the racing track being applied to roadster machines. Quick-acting cams, which allow a rapid release of the exhaust at very high temperature, cause much more noise than a slower action of the valves and a medium compression. Theoretically a big silencer should be most effective, but it has been proved that size alone does not reduce sound, and that, on the contrary, it has been known to increase it.

Although a really noisy motor cycle engine can be most objectionable even to the most enthusiastic motor cyclist, we do not consider that a reasonable amount of noise can be a legitimate reason for interference with the rights of motor cyclists, whilst other noises produced by road traffic are endured without complaint. Heavily-laden iron-tired vehicles, running on paved streets drawn by horses or propelled by motors, make a hideous noise both by night and day, but no one seems to agitate for the wheels of such vehicles to be rubber-tired, or for more silent mechanism.

In this case of silence and the use of cut-outs, a few irresponsible riders have attracted public criticism, and the generally well behaved motor cyclist has to thank them for their indiscreet conduct. In our opinion, it would meet the case even now if the authorities were to prosecute riders who made use of the cut-out in towns or in such circumstances as to cause annoyance or inconvenience to other users of the road. When the critical public have got their desideratum—a quiet exhaust—we expect the next complaint will be that quietness itself is dangerous, and that sufficient audible warning of approach is not given.

MUDGUARDING.

A STUDY OF THE VARIOUS TYPES OF MUDSHIELDS.

NOW is the season of rain and mud, when he who goes forth on a motor cycle needs to be well protected both as to himself and his machine. Consequently, a few notes on mudguarding, made after careful examination of motor cycles at the recent Olympia Show, may not be out of place. The writer does not pretend to have included the name of every firm who manufactures or exhibited neat mudguarding devices, but only to give his impressions of the various types of guards, and in some cases a few instances which he happened to notice while wandering around the Show.

Firstly, it is pleasing to be able to say that mudguarding as a whole has received more attention in connection with 1912 models than formerly. Side extensions or wings of some sort fitted to the front wheel have become almost standard, and many firms are fitting either side flaps to the rear guard or very broad rear guards which afford protection from the mud hurled from the belt and brake rims.

Weak Points of Design.

The subject is one which has not been studied as it deserves to be, for in many instances the front guard side flaps stop short behind the front forks,

A common form of mudguarding in which the forks and brake gear are left exposed. The flap should be extended past the fork.

A better type, employed by Chater Lea, Rex, P.M.C., Douglas, P. & M., A.S.L., Excelsior, and others.

leaving the mud to fly out at this point, and so foul the brake gear, and often the springs of the forks, and more especially the rider. In very exceptional cases was the front guard carried sufficiently far forward to prevent the mud flying forward and blowing back on to the rider. A simple rule which has been found very effective is to extend the guard so far forward that it would comfortably miss a wall should the machine be wheeled against one. With this type of guard it is advisable to have the front part easily detachable to facilitate tyre repairs.

Dispensing with the Magneto Shield.

One may notice with regret the tendency to leave the magneto (when placed in front of the down tube) unprotected. This is probably due to the modern mudproof magneto, but a good magneto shield on the lines of that on the Triumph machines saves a lot of cleaning, and what could be more annoying to the rider who likes to keep his machine spick-and-span than to have to grope about below his magneto and silencer to remove some pounds of semi-baked mud?

Several makers are now fitting footboards to their two and three-speed models, and these in themselves form some protection to the rider's legs, but why not go a little further and fit a light, easily detachable underscreen? This would protect the crank case and pulley, and if extended far enough rearwards would afford some protection to the belt. There seems to be no objection to an underpan, for it cannot slow the machine.

Here I must pause to say a good word for the Scott. This make has splendid front guards, with side flaps extending their full length. Further, it has large sloping side wings which protect the rider from mud thrown by the front wheel, it has quickly detachable sprung footboards, and, to the best of my knowledge, it is the only standard machine to be fitted with an undershield. Is not such a specification tempting to the all-weather rider?

This type of mudflap was used on the Scott machines as early as 1908, and has been standard ever since. It is also to be seen on a few other makes.

Protection for the Rear Wheel.

As I have already mentioned, rear wheel guarding has, on the whole, improved considerably, but sufficient notice has not yet been given to protecting the belt. The best instance of belt guarding was that on the Dot machine shown by the Service Co., and of which a rough sketch is shown herewith. It will be remembered that a somewhat similar guard was used on the T.T. Matchless. A guard extends well inside the belt rim for half its circumference right up to the crank case, below the bottom bracket, while at the bottom this is bent at right angles and extends partly round the engine pulley. This device should almost wholly protect the belt from mud and water, and so considerably lengthen its life and minimise slipping.

While on the subject of transmission guarding, I should like to say a few words about chain protection. The majority of manufacturers of chain-driven

Diagram showing the very thorough mud protector fitted to the Dot.

motor cycles leave the rear chains entirely exposed, or protected only on the outside. (I can only think of one make which has its chains entirely enclosed.) Surely this is a mistake, for a large amount of mud is thrown from the wheel on the inside. To inefficient chain guarding I attribute the fact that chain drive is

Mudguarding.—

making rather slow progress on motor bicycles, for as long as mud and grit reach chains, so long will they stretch and wear the sprockets, necessitating constant adjustment. Cannot some of the brains employed in the motor cycle industry devise a means of enclosing chains and running them in oil, and still leave the rear wheel easily detachable? This has been achieved

Several firms fit flaps to prevent mud being scattered over the pedalling chain and chain stays. In the case of the Arno, flaps again occur at the rear of the guard, as illustrated.

by cycle firms, and I can see no good reason why it should not be carried out successfully on motor cycles. I can almost hear the reader retort, "Oh, but you can't get at the chains quickly"; but I would remind such a one that if the chains ran under these ideal conditions they would be quieter and more efficient, and there would be little likelihood of them requiring attention except at rare intervals. In fact, I doubt if, after the first adjustment which would take place in the works after test runs, the chains would need attention for several thousand miles. This argument is based on experience with chain-driven cars, which, though they use heavier chains, have also heavier strains imposed upon them.

Casings for Toolbags.

A not unimportant feature of the show was the improvement noticeable in the protection of toolbags. Zenith machines are all fitted with a toolbag and tube case at the side of the carrier, protected from mud by a large guard between them and the wheel. The A.J.S. machines carry a leather tool case sliding in a metal drawer at the rear of the carrier; and a few well-known firms, including the Rudge and Triumph, carry pannier toolbags protected on two

The E.L.I. mudshield, a popular and efficient guard for the front wheel.

sides and the ends by metal cases. These methods all prevent the bags from sagging and becoming unsightly, and tend to preserve the leather.

Screening the Engine and Parts.

One of the few real novelties in the Show was the Swan open-framed motor cycle, and this mount is certainly one of the best protected as regards its engine, magneto, and parts, as, with the exception of the cylinder, carburetter, and silencer, the whole power unit is encased.

At first sight one gains the impression of general inaccessibility, but this is not by any means the case, as the magneto and driving chains may be adjusted

from the outside with great ease, and by the removal of three bolts and the necessary connections the engine can be removed from the frame. Long footboards are fitted to the sheet steel side members, and are sloped upwards in front, thus protecting the rider to a considerable degree.

An interesting example of mudguarding was exhibited on the XL'All stand, and was produced by the Moturner Co. The front mudguard extends a very long way forward, and has side flaps almost down to the ground, gradually widening towards the bottom, also large metal leg shields, bent forward at their outer edges so as to form wind scoops, extend from the tank to the front of a pair of long sprung wooden footboards. The rear wheel has deep side flaps, the top portions of which are formed with deep grooves at their lower edges, which grooves lead to a kind of spout at each end to deflect water clear of the belt.

Detachable Mudguarding Devices.

Of course, apart from the special devices used on standard machines, there is a fair selection of these excellent accessories, including the Miller mudshield, Cameron's legshields, and Bluemel's detachable flaps for fitting to existing front mudguards.

Diagram showing the writer's idea of a properly-guarded belt-driven motor cycle for all-weather riding.

A. Front guard with side flaps (detachable from forks). B. Broad mudflap at bottom. C. Leg shields with side extensions. D. Footboards. E. Under-screen. F. Rear wheel and belt guard (detachable from rear stays).

The E.L.I. mudshield, introduced by Mr. Eli Clarke, forms a most efficient front wheel guard, enclosing as it does a full half of the wheel, and in addition having large flaps at right angles to the wheel to prevent splash. These guards are light and easy to attach to almost any machine.

The four-cylinder T.M.C. is the only machine having such a large guard as a standard fitment.

The large domed guard covering the belt and brake rims on the sidecar model Premiers should effectually keep the mud from the rider and the rain from the belt.

In conclusion, I would like to draw attention to the appended sketch showing my idea of a properly mudguarding machine. (It will be noted that many of the fittings are now used by various firms, while others are carried rather further.) I am quite prepared to admit that its defects are weight and unsightliness, but the genuine "mud-plugger" would be only too glad to put up with these disadvantages for the considerations of extra comfort and cleanliness. I should imagine that it is just the thing for those motor cyclists who contemplate competing in the long-distance winter runs.

H.D.T.

Quickly Detachable Rear Wheels.

I wonder how many visitors to the Show noticed the Puch idea for removing the back wheel. On the near side the rear forks and chain stays were cut in half and screwed together by large nuts; on the off side a single large nut freed the wheel. The idea is worthy of imitation on some machines, where a complex hub mechanism renders the simple "two-nut" or T.T. style of rear wheel impracticable.

There is a marked and praiseworthy tendency to secure complete accessibility of the rear wheel, and as long as we remain content with light driving wheel tyre covers such provision is necessary. During 1911 I was compelled to fit new covers or tubes by the roadside on far too many occasions.

Counter-shaft Drive.

One machine at Olympia I examined with more than usual interest. It was the Douglas single-gear roadster, with combined belt and chain drive. The makers discovered that on their two-speeded model the belt lasted nearly 4,000 miles, as against half that distance on the direct driven pattern. The reason was that the two-speed models effect their ratio reduction by chain and employ a large counter-shaft pulley. Consequently Mr. Douglas has elected to give his single-gear models the benefit of this large pulley during 1912, and the single-gear models are now fitted with a ball-bearing counter-shaft, chain driven off the engine, and driving the back wheel by belt off a pulley of large diameter.

Of course, the belt drive of a $2\frac{3}{4}$ h.p. engine is handicapped by the small diameter pulley required for a $5\frac{1}{2}$ or 6 to 1 gear, and the case is not on all fours with a $3\frac{1}{2}$ h.p. engine, which may do most of its work on a 4 to 1 gear; but it is obvious that the belts of the $3\frac{1}{2}$ h.p. machines would benefit in due proportion from a similar plan. In my opinion the friction of a ball-bearing counter-shaft is negligible.

After twelve months' experience with the combined chain and belt drive on the machines with counter-shaft gears, it is possible that the engine pulley may be replaced by a short chain, running inside an aluminium case, and driving a counter-shaft carrying a large (adjustable) belt pulley.

Weak Rear Carriers.

I was sorry to notice at the Show that so many machines were fitted with rear carriers possessing no real support at their front ends. Many whose acquaintance with the motor cycle industry is comparatively recent appear to imagine that a couple of stays running down to the rear forks or chain-stays on either side take the real burden of the carrier, and that a small bolt or rivet fastening the carrier to the mudguard at its front end is the only auxiliary required.

I have owned three machines with carriers of this type during 1911, and every one of them has given way; in two cases the mudguard broke as well. My experience of carriers is that the real strains act not downward, as one might imagine, but backward. The main energy of the carrier and its load is apparently

devoted to tumbling down astern behind the back wheel, and small bolts and rivets attaching it to the mudguard are a certain source of trouble.

Let me guard myself from the imputation of "flapper-carrying"; my carrier has never supported live weights—I use it for genuine luggage of a light order. It is not too late for the errant firms to run the side members of the carriers right through to the saddle tube tightening bolt, or other strong support, before the period of big deliveries begins.

Bowden Wire Adjustments.

Many firms who make an otherwise almost perfect machine neglect to provide adequate adjustment for the Bowden control wires. The exhaust valve lifter wire is in most cases fitted with an adjuster, consisting of a threaded bracket eye, a threaded barrel, and a lock-nut. This device too often requires a couple of special thin spanners (which seldom figure in the kit); it is not long enough to take up all the slack which develops before the wire breaks, and when the adjusting barrel is screwed far out of the holding eye it wobbles badly, so that the threads presently strip. A strong device with greater range is needed.

The carburetter wires on some machines are destitute of any adjustment at all. My personal feeling is that all these flexible wires should have efficient adjusters. It is a fairly simple job to remove the inner stranded wire, melt off the nipple, cut the wire, and re-solder; but these simple jobs are frequently scamped by the average mechanic or muddled by the average semi-mechanical amateur. A flexible wire, properly fitted, affords ideal and reliable control, and the manufacturers should safeguard themselves from the eccentricities of the bad mechanic (amateur or professional) by providing solid adjustments.

Miss Leda Leslie, of Akron, Ohio, who is an enthusiastic rider of a 4 h.p. Harley-Davidson motor cycle. Miss Leslie, we are told, has owned two single-cylinder 4 h.p. models, and is contemplating purchasing a $6\frac{1}{2}$ h.p. twin of the same make.

What the Press
says about the
Trusty

TRIUMPH

a few passages chosen
at random.

It is gratifying to note the progress of any enterprise into which great foresight and perseverance have been put. Therefore the motor cyclist will experience a feeling of genuine pleasure when he pauses at the stand of the Triumph Cycle Co., Ltd., of Coventry. This company, in the pioneer days of the motor cycle, were farseeing enough to realise the vast future that there was in this machine. Having this faith in the future they allowed nothing to daunt them. One difficulty after another was overcome. Gradually, by dint of ceaseless effort, they built up the wonderfully efficient machine which is to be seen on their stand to-day.

Daily Mail, Nov. 21st, 1911.

Thanks to the pertinacity and enthusiasm of a few firms with a personal belief in the future of the motor bicycle, the new line was not entirely dropped, as it looked very like being, to the foreigner, and in this matter one must not forget the debt of gratitude which the industry owes to the Triumph Company, which, almost alone amongst the leaders of the cycle trade, stuck grimly to its task, and gave the lead which has put England clearly at the head of the motor cycle movement.

Morning Leader, Nov. 23rd, 1911.

The Triumph Motor Bicycle is acknowledged to be without a superior, whether of British or of foreign manufacture, and the company's stand will be a centre of attraction during the week.

Glasgow Herald, Nov. 20th, 1911.

The Triumph's long record of success, and widespread popularity have secured for it a very prominent position as a standard type, which has served as a model for countless imitators.

Daily Chronicle, Nov., 20th 1911.

The pioneers of the motor cycle movement are determined to keep the trusty Triumph in the very forefront. With everybody connected with the concern enthusiastic riders, it is natural that the famous machine should retain its place as the most practical of motor bicycles. Jealous of their great reputation—a reputation which has been an asset to the industry as a whole—no detail is adopted unless it is proved beyond doubt that the utility of the machine is enhanced without detracting the slightest from its reliability.

Glasgow Citizen, Nov. 22nd, 1911.

Motor Cycle Competitions in all Parts.

Eric Tyler (T.T. Triumph).

H. Kiddle (2 h.p. Humber).

LAST week's mail brought us news of a number of motor cycle competitions in different parts of the world, the results of which are appended.

Australian Record Broken.

The Victorian M.C.C. held a fifty miles road race near Melbourne on the 1st October, when some very fast speeds were recorded. The winner proved to be Eric Tyler, riding a T.T. Triumph, who covered the distance in record time (57m. 45s.)

Racing on the Sands in N.Z.

Racing on the sea beach was commenced in New Zealand. In a five miles motor cycle handicap on Brighton Beach, the winner proved to be H. Kiddle, who, riding a 2 h.p. Humber lightweight, averaged a speed of 35 m.p.h. on heavy sand.

South African Hill-climb

The Rand Motor Cycle Club held a hill-climb on Mountain View, near Johannesburg, on October 22nd last. Three classes

were included in the programme, the results of which were: All Classes of Motor Cycles—First on formula, P. Flook (2 h.p. Humber); fastest time, O. Metzger (Bradbury), 65 $\frac{1}{5}$ s. Standard Class—First on formula, P. Flook (2 h.p. Humber). Racing Class—First on formula and fastest time (61 $\frac{1}{5}$ s.), Van der Merwe (Triumph).

Hill-climb in Natal.

The Natal M.C.C. held a hill-climbing contest on the same day on Jacob's Ladder at South Coast Junction. F. W. Brook (3 $\frac{1}{2}$ h.p. Triumph) won on formula, W. Mail (3 $\frac{1}{2}$ h.p. Ariel) accomplishing fastest time.

Sydney to Melbourne.

A record ride between the above towns has been made by J. A. Farr, riding a 3 $\frac{1}{2}$ h.p. Kerry-Abingdon, who covered the distance in 48 hours. He was delayed for seven hours by lamp failure near Wangaratta and for four hours at railway gates trying to find someone who could open them.

Two's Company

By B. H. Davies

Among the Passenger Models at the Show

NOT since the autumn of 1904 has an English show presented such a wealth of motor cycle passenger vehicles. Over forty different variably-g geared tricars were staged at the Agricultural Hall in 1904, and most of them lost their makers a deal of money. Naturally, compared with modern productions, they were somewhat crude in design, destitute of proper springing, expensive to buy, and costly to run; even their engines were in most instances troublesome, chiefly due to the whimsies of their ignition. The 1911 Show contained a far larger assortment of staunch, cheap, and reliable machines, most of which should prove exceedingly satisfactory in use.

The passenger exhibits fall into three main classes, viz.:

1. Sidecars, either permanently attached to motor bicycles or capable of attachment and detachment.
2. Three-wheeled runabouts with two wheels astern.
3. Three-wheeled runabouts with one wheel astern.

It is impossible for me to deal with each individual exhibit in detail, and my aim will rather be to assist comparative novices to make a wise selection.

Accessibility of the Rear Wheel.

The main trouble with the single driving wheel astern type (of which I can claim a large and varied

experience) is likely to occur with the back tyre. A 5 h.p. or 8 h.p. machine of this type requires an immensely strong driving wheel and tyre. One common defect may be tested by eye—the accessibility of the wheel. Punctures in this wheel are inevitable, and are likely to be numerous. It is vital to happy touring that the tube of this wheel shall be instantaneously accessible to both *repair* and *replacement*. In the years when I garnered most of my experience with this type of passenger mount, patches such as the Holdtite and Patchquick had not been invented, and a hand-applied patch in those days promptly curled or melted off. To-day a patch will stand on such wheel, but often the tube will be torn or ripped or burst when a nail enters during a sprint, and if it is a two-hour job to get a new tube in place that machine should be black-listed.

The second point requires a road test with a deflated tyre. Will the machine steer on a flat driving tyre? My experience is that very few single rear drivers will answer the helm when the back tyre deflates suddenly, if the rear wheel is sprung.

In 1906 I bought a tri-car of this type which is still running. In its five years' work it has upset or left the road on more than one occasion, simply through derangement of the steering due to a deflated back tyre. Another similar machine with longer and flatter springs can be kept on the road by determined effort and a pair of strong wrists.

I wonder if any maker understands why a deflated back tyre renders this type of mount so hard to steer, and is able to counteract it? If so, let him publish his conclusions. I have asked many makers to give me a demonstration, and so far nobody has accepted my challenge. Were I buying another machine of this type, I should insist on a trial run with an ancient deflated cover on the driving wheel.

Rocking Propensities of Fore-carriages.

Thirdly, it is well to rock the fore-carriage violently with one's hand as the machine lies at rest. I remember a maker who brought out a tri-car of this type in 1906, and he invited me to try it with the remark, "It's not like motor cycling; it's more like sailing." And he was perfectly right; the side sway was enough to make me seasick. Several machines at Olympia were capable

The new twin-cylinder Hobart and sidecar. This machine has a Millennium two-speed hub gear the operating mechanism of which is encased.

Two's Company.—

of being rocked considerably. Those machines which have amply proved their worth in long distance competitions are the machines one is safest with.

One make of machine I saw had a rear spindle nearly two feet in length threaded through a hub barely eight inches across; at one extremity of this lengthy spindle a chain wheel was mounted, at the other a brake drum. I imagine the strain on its bearings would be considerable.

Turning to the two-wheel astern type, there are points to be watched here. A long wheelbase is desirable if upsets round corners and on steep cambers are to be avoided. Moreover, the weight must be concentrated well inside the wheelbase. Otherwise the riding sensation will be like that of the obsolete cobby De Dion tricycles. These had passenger, tanks, and engine hung on top of the back axle, and away out in front bounced a lively little steering wheel, with scarcely an ounce of weight to keep it down. Only by leaning on the handle-bar could such design be steered at all on rough roads, and the constant vibration on the best of surfaces was exceedingly trying. Such an outfit might almost tip over backwards when ascending a gradient like the Trough of Sutton Bank; and I noticed one or two outfits conspicuous for this fault at Olympia.

They need a lot of weight forward, and all the load should fall inside the wheelbase, while the seats should be very low, to keep the centre of gravity near the ground. A high machine with a narrow track spells danger, more especially at corners.

The Sidecar Pre-eminent.

Turning to sidecars, we saw a much more uniform and well-developed exhibit. The sidecar boom is undoubtedly due to the provision of so many reliable variable gears. I shall not deal

Two-speed four-cylinder F.N. and sidecar, fitted with hood and storm apron.

The two-speed gear on the 1912 four-cylinder F.N. is hung around the propeller-shaft casing as shown.

with the vexed question of the right type of motor bicycle for hauling a sidecar. Suffice it to say that the expert or the potterer in a level district may rest content with a single-gear $3\frac{1}{2}$ h.p. outfit, with or without free engine.

The man who is not a born tinkerer, whether he lives in stiff country or an easy region, requires a change-speeder. The smaller the engine, the more speeds it should have. My friends who ride $3\frac{1}{2}$ h.p. two-speeded passenger outfits all say they yearn for an intermediate gear; the long grinds on bottom

gear up slopes that are too steep for the top gear are their *bête noire*.

The tourist who wishes to go where the mountains and the scenery are requires a powerful twin-cylinder multi-speeder. Sidecars are becoming magnificent. I heard ladies exclaim at the comfortable torpedo bodies, with scuttle dash, wind screen, side doors, and springs and shackles at every point of attachment. Personally, I prefer a long, lithe wicker torpedo with a waterproof apron to the boxed-in type; although I admit the comfort of the former type. I should funk an accident with passenger practically fastened in. It is startling to see a sidecar labelled £20, but it seemed to find buyers galore. At any rate, it was high time that the short, squat, unsprung, low-backed basket sidecar died; it used to jerk one's inside into a mash, and print its woven pattern on one's anatomy.

Quickly Detachable Joints.

Mechanically, the improvements are no less evident. The attaching joints are excellently designed for quick work, and proof against involuntary detachment. In the best makes the axles are made from steel stampings, and my readers are warned

8 h.p. Bat power plant, showing chain transmission and counter-shaft two-speed gear box.

Two's Company.—

against the jerry-built patterns. Stands are provided, springs of correct design and luxurious insulation are fitted at every point of suspension, luggage grids and petrol can carriers have been neatly incorporated, and so on. 1912 will be a bigger sidecar year than 1911, and that is saying a good deal. The passenger demand will cancel the reductions made from the 5 h.p. and $3\frac{1}{2}$ h.p. market by the growing popularity of the medium weights, and the sidecar demand will keep the variable gear manufacturers truly busy until the day comes when every motor bicycle, for whatever purpose it is used, carries a variable gear of some kind. Numerous quadricycles of more taking design than the average three-wheeler were debarred from exhibition by the terms made between the owners of Olympia and the promoters of the Show, but I hope to see them included another year. Of course, there must be a weight limit, otherwise we should have big cars masquerading as "light four-wheelers."

Overloading a $3\frac{1}{2}$ h.p.

In connection with the sidecar demand, I think I need only utter one word of warning. An impulsive acquaintance of mine met me at a sidecar stand, and I sympathetically studied his beaming face as he placed a detailed order for an up-to-date coach-built sidecar. It was to have a

The new twin-cylinder V.S.-Jap, with Dunkley sidecar.

Front view of the Clyno and sidecar, showing the "Dreadnought" shaped front of the sidecar.

torpedo wooden body with side door, glass wind screen, Cape cart hood, baggage grid, well to hold four gallons of petrol, pockets, cushions, mats galore, and a bracket for a huge F.R.S. head light—a most lordly specification, methought.

When all the details had been booked by the gratified exhibitor, we linked arms, and wandered away. It occurred to me to ask what machine was to have the privilege of pulling this lordly limousine on one wheel, and he began to expatiate on the beauties of a well-known $3\frac{1}{2}$ h.p. model with two-speed gear. I fully agreed with his panegyric on that very first-rate motor bicycle, but suggested that he might as well ask a lady's park hack to drag a pan-technicon van. These heavy sidecars should not be unequally yoked with $3\frac{1}{2}$ h.p. tourist cycles; they are meant for 8 h.p. twins and similar leviathans. When a rider reflects on the weight of the wooden body, and the resistance of screen and hood to the air, not to speak of the petrol and luggage, it would take him all his time to coax his outfit up Hindhead in the rain. In connection with the $3\frac{1}{2}$ h.p. machine he has ordered, he would enjoy a far pleasanter season with a light canoe body of wicker or cane, destitute of more refined protection against bad weather than can be provided by a good roll-up storm apron. It should be remembered that wind resistance is a far more serious item with a sidecar than with a solo machine. Anyhow, some lucky girls are going to have a good time next year.

Method of removing the detachable chain cases on the 1912 model two-speed Clyno. Observe the exhaust pipe extending to rear of machine.

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tufel Street, E.C., and should be accompanied by the writer's full name and address.

Road Dangers at Night.

[6102].—I notice that another motorist, a taxicab driver, has been killed near Nottingham, by running into cattle driven on the road after dark. The jury added a rider that cattle should not be driven on the road after dark without warning lamps being carried by the drovers. When are we going to get proper protection for road users after dark? This was agitated for a few years ago by the Coventry and Warwickshire Motor Club in the form of a petition to the Warwickshire County Council.

ERIC W. WALFORD.

Silence and Silencers.

[6103].—We have read with considerable interest the correspondence and articles which have appeared in recent issues on the question of silencers, and we quite endorse your contention that a perfectly efficient silencer will not only cause no back pressure, but will actually have an opposite effect, and will assist in the removal of the used gas from the cylinder. This fact was demonstrated during these important silencer trials conducted by the Automobile Club de France, at which our "Clair" silencer gained the highest award, the gold medal. It was stated that the "Clair" silencer tends to create a vacuum.

Your remark regarding the continuous escape of the gas being desirable is also true, and can easily be demonstrated by holding one's hand near the outlet of our silencer.

On the subject of long exhaust pipes we might mention that we have recently fitted several of our type 4b silencers to 7-9 h.p. J.A.P. engines in various frames, the exhaust pipe being carried to the rear of the machine and the silencer attached to the end. The results obtained have really been excellent.

J. C. LYELL AND CO., LTD.

The Wear of Big-end Bearings.

[6104].—I saw a twin-cylinder engine of 8 h.p. in the big end of which a ball had burst whilst running. It smashed up and ground to pieces five or six other balls in the race, smashed up all to pieces its outer and inner races, damaged the races and balls of the other connecting rod, broke several pieces off the bottom of the piston, through allowing it to come down too far and hit top of crank case, and so put out of action a brand new engine. Has any other reader had a similar experience? It seems likely that when one or two balls at the top of the race have to take up the full force of the explosion, if one does happen to break, it is going to play havoc, and it cannot be replaced locally in the same way as a gunmetal bush.

G.A.P.

[6105].—I quite agree with Mr. J. H. Sinclair [6073] as to the good wearing properties of hardened steel to hardened steel, with any oil between. I once knew an old high machine with ordinary front wheel bearings. As the machine got out of date, not having ball bearings, it was used as a letting-out back, and when last I saw it the bearings were as rigid as when new. There was no "take up," whereas during that time gun-metal bearings were very badly.

Another point as to oiling bearings in a modern motor cycle. I think this could be easily got over by the feed-pipe from the oil pump being placed behind the cylinder, instead of in front, so that the oil is squirted directly on to that part meeting the rapidly rising crank pin.

W. H. ROWE.

Lamps and Winter Riding.

[6106].—In your issue of November 16th, I notice a letter from Mr. Francis C. Turner [6045] dealing with the question of lamps. His suggestion of a small handful of cotton waste on the carbide for the purpose of obtaining a steady light is excellent, but I feel that a word of warning should be given as to his second suggestion. He advises the addition of two ounces of peroxide of hydrogen to one quart of soft water as a liquid for the generator. Peroxide of hydrogen almost invariably contains acid, which would undoubtedly have a very bad effect upon the metal of the generator. The light given off would, in all probability, be improved, but the life of the generator would be considerably shortened.

HAROLD BRODRICK.

Adjustable Tappet Rods.

[6107].—I send a sketch of an adjustable tappet. I have often wondered why this fitting is not more universal, particularly in the case of racing machines. Several times I have read in the account of an attempt on record that the competitor was forced to retire owing to his valve lengthening. This means either fitting a new valve, or a job which takes some time to manage, and which is especially awkward with a very hot engine.

The suggested adjustable tappet dispenses with this, as it can be adjusted in less than two minutes. The sketch is practically self-explanatory. A is the stem of the tappet. On the first inch or so of this a thread is cut, and a milled lock nut B is screwed on. The tappet head C is drilled through to within about $\frac{1}{16}$ in. of the top, and is tapped to fit the thread on the tappet A, and locked by B. Any adjustment needed is made by simply slacking the lock nut B, and by screwing the head C up or down as may be required.

D.K.

[Various forms of adjustment for the tappet rods have been fitted by different makers for some years. No firm has so far used a locking device which does not require the use of tools, and we doubt if a finger tight lock nut would remain secure for long.—Ed.]

Overheating.

[6108].—With regard to letter No. 6042 in *The Motor Cycle* of 9th ult., re incorrect mixtures, R.R. states that with an open exhaust he saw blue flames issuing from the engine with a certain setting of the air lever of the carburetter. I have a $1\frac{1}{2}$ h.p. lightweight F.N. to which I fitted a cut-out close up to the top of the exhaust pipe, and which I use for the main purpose of watching for this blue flame. My experience has been that when tuning up this machine at night, the machine is doing its best when a long blue flame is seen with the cut-out open, more extra air turning the flame to yellow and diminishing the speed, whilst opening up the throttle full without giving more air gave a brick-red flame. I have, therefore, worked on the theory that this blue flame was a sign of complete practical combustion, for I fail to see how with an engine running at 2,500 revolutions per minute or more, you could possibly

expect each charge to have completely burnt itself out in the short space of time before the exhaust valve opens.

How far my practice has been successful may be judged when I say that in the hottest week of the summer I rode this machine from Maldon, Essex, to Torquay with only once giving pedal assistance at the end of a long hill at Chideock, just before getting into Devonshire, and never once stopping through overheating. I should be glad to know if I am wrong in working on this theory; if so, what should be seen with an open cut-out at night that would give better results from a small machine such as mine.

H. L. MITCHELL.

Proposed Abolition of Cut-outs.

[6109].—I have been following up the correspondence in your paper regarding silencers and cut-outs, and notice in a recent issue that cut-outs are very likely to be prohibited by the L.G.B.

Is this not a very mean and jealous step to take? Let us consider other road traffic; for instance, the lumbering motor lorries with huge iron wheels—the very thought of them with their awful noise makes one shudder.

No, jealous people do not consider this an annoyance. I live in a main road with nothing but motor traffic passing by from morn till night, and whilst in bed my head is often shaken violently on the pillow by the vibrations caused by these vehicles of torture.

How different it is to hear the pop-pop of the motor cycle.

When the Local Government Board has put down noise made by heavier traffic, then, and not till then, will it be correct in interfering with the smaller traffic, such as motor cycles.

ARTHUR R. CHOLDCROFT.

[6110].—With reference to the above, I think that such a measure instead of having a good effect would have only a bad one. Will not the great majority of riders simply drill out their silencers if no cut-outs are fitted, and make their machines more noisy than ever? I do not see how a small silencer can be made really quiet without causing a certain amount of back pressure. Also I consider it much safer to drive with the cut-out open in narrow twisty lanes. At the present time there are a number of really quiet machines, but if cut-outs are abolished, I am afraid that they will not remain so. My own machine is a 6 h.p. Matchless which is extraordinarily quiet; there is very little back pressure, but all the same, I like to use the cut-out in the open country and when I come to a bad hill. I never use the cut-out in towns, but outside the engine is bound to keep cooler and to run better with it open. With a cut-out one does not mind a little back pressure, and can have a really quiet machine. No, I consider that what is wanted is not the wholesale condemnation of cut-outs, but their use in the right place.

E. B. HALL.

Single-cylinder Machines and Sidecars.

[6111].—I was very much interested in "H.P.B.'s" letter [No. 6055]. It practically amounts to a challenge to any owners of $3\frac{1}{2}$ h.p. machines and sidecars to climb the hill from Dartmeet, or rather to go from Tavistock to Ashburton. From Ashburton to Tavistock is perhaps the stiffer journey of the two, but let the other be done first.

Should the challenge be accepted, I hope notice thereof will be given in *The Motor Cycle*. I think that motor cyclists who live in South Devon would like to witness the attempt. I use the word "attempt," because local riders, who own only $3\frac{1}{2}$ h.p. machines, rather pride themselves on climbing these hills *solo*.

I am not sure that the Six Days' Trials could not be held in Devonshire, as I think that local riders could probably pick out several very "useful" hills indeed. With a little encouragement I think they would try. T1111.

* [6112].—I should be pleased if you would permit me to have a say in the single-cylinder sidecar machine question. I am quite sure that with modern motors it is more a question of the abilities of the driver. I know lots of single-cylinder machines that are taking sidecars about the hilly Peak or Derbyshire district—without any l.p.a. too.

Mr. Gibson is quite right with his claims for the Bradbury, as I know a gentleman who has done thousands of miles this year, mostly in Derbyshire, with a single-

geared Bradbury and sidecar. I know he can take all the main road hills—including the famous Mam Tor—without any trouble or assistance. A suitable gear is one of the main things, and a great many riders over-gear, making the risk of overheating much greater than by dropping the gear another point or two.

Writing of gears, why do the manufacturers of two-speed gears make such a big drop from the high to the low gear? Is it to allow for friction? The P. and M. is one of the best gears I know, but the big drop in gear ratio makes the machine (with sidecar) very slow on hills. I think for hilly roads the ratio of 6 and 9 to 1 would make this machine a lot faster than with the usual gears of 5 and 9 to 1. I consider the variable gear the ideal to aim for, but there is a small fortune waiting for some enterprising manufacturer who will market a simple bracket gear (to fit existing machines) with chain to gear and belt to rear wheel with large adjustable pulley on counter-shaft. The gears could then, by adjusting the pulley, be fixed at what was required. I have the money waiting for a gear on these—or easily fitted variable gear—lines, as I consider it a great saving both in petrol and wear of engine to coast or raise the gear down our hills, often four or five miles long.

SINGLE.

[A bracket gear on the lines suggested was exhibited by the Bowden Wire Co. at Olympia.—Ed.]

Hints on Dismantling the N.S.U. Gear.

[6113].—My experiences with this gear may interest and emphasise the necessity of the warning of "Don't" to those who would allow anyone but the makers to dismantle it. When I bought my 6 h.p. twin with heavy sidecar the agent told me not to oil the gear as it was engine fed. It transpired later that this was not the case, the engine-shaft not being hollow but solid. However, I obeyed directions, and rode about 3,000 miles without a drop of oil, save that put in by the makers. Then the trouble began, the low gear and neutral finally failing to work. I took it for repair to two leading garages in a big town. The first mechanic couldn't take it to pieces at all, but said "he would do it first thing in the morning." In the morning he said it was all right, the trouble being that the *leather* (if you please) of the clutch had become dry and shiny. He had, however, oiled it well, and it would now run. Needless to say it did not. Mechanic No. 2 did manage to dismantle it, discovering, of course, no leather, but the fact that it was epicyclic. Some parts were broken, and these were telegraphed for. But oh! the hammer and punch work of these mechanics who have not the proper tools! After this I whipped out the gear and took it to the N.S.U. Co. The remarks on local mechanics were interesting. Justifiable, too, for amongst other things mechanic No. 2 had omitted to put in an important washer, not knowing where it ought to go.

Two conclusions: (1.) The N.S.U. gear, kept well oiled and untampered with, cannot be beaten. (2.) Avoid mechanics who use hammers. U.S.N.

State of the Exeter Road.

[6114].—Now that the preparations for the M.C.C. Exeter winter run are being made, it may interest intending competitors to know that the road after Barford Corner, about three miles beyond Wilton, was, this autumn, in a condition that would suggest the need for greatest attention to tyres, repair outfits, spare tubes, and working lamps. For several miles the surface was entirely covered with loose broken flints in large fragments with quite sharp cutting edges. Towards Shaftesbury it improved, but near Barford Corner it was the most destructive surface I have ridden on in many hundred miles, and even in broad daylight there was no escape. The treads of my tyres were covered with a flagree incised pattern during these few miles. That they were not pierced was, I believe, solely due to the fact that I was riding the best and heaviest covers I could get—only by special order though—on a lightweight machine. I have never yet understood why lightweight makers do not fit at least 24in. rims, which would leave the choice of top quality tyres unrestricted. When I selected my machine I chose one that gave me a possible 24in. tyre, although in all other points I should have decided on one that allowed nothing beyond 14in.

ROWLAND BRIANT.

THE CHAIN DRIVEN

Indian

Motocycle

"THE EVOLUTION OF TRANSMISSION."

We cannot pass without comment the article by "Ixion" under the above heading in last week's issue of "The Motor Cycle."

"Ixion" says:—

"..... After many years of devoted allegiance I have at last lost my faith in the belt drive as the one and only motor cycle form of transmission for time and eternity."

and further,—

"..... Who would buy a push-bicycle with a transmission that needed attention, perhaps, every 500 miles in dry weather, that sometimes completely failed to drive the rear wheel in wet weather. Anybody who competed in either the Scottish or Harrogate Six Day Trials this season will recall the frenzied adjustments at the foot of every bad hill, adjustments often repeated two or three times in as many miles when the roads were awash; and even the least experienced spectators commented freely on the *festoons of spare belts* with which the handlebars were swathed. Surely we are only waiting for the chain drive to be perfected to adopt it as standard."

THERE IS NO NEED TO WAIT. THE CHAIN DRIVE IS PERFECTED ON THE
INDIAN MOTOCYCLE.

PROOF.—The Chain Drive has brought the INDIAN Motocycle successfully
 —through the A.C.U. Six Days' Trials for the last FIVE YEARS.—

49 Criterion Works, Birmingham.

Note that samples of BROOKS Saddles and Cycle and Motor Cycle Accessories can be seen at our London Showrooms—11, GRAPE STREET, SHAFTESBURY AVENUE, W.C.

Say "P. & H." please—

—Everything depends on insisting upon having a "P. & H.," because everything that matters in the LAMP world finds inclusion in the production that bears that title.

— "P. & H." is a name synonymous of highest excellence and highest value in "Lamps."

—For greatest efficiency, reliability and long wear "P. & H." Lamps are unsurpassed.

— Every "P. & H." model is All-British in material and manufacture, and, as the standard of quality in British Lamp design, is without an equal—otherwise than its counterpart.

— Remember these facts and what our "title-sign" means to you—then you can't go wrong in buying.

—Obtainable of all good Agents everywhere. Booklet free.

HERE'S our "P. & H." Headlight Set—the pre-eminent popular Motor Cycle Lamp. Complete with Generator Bracket and Tubing... 21/- set. Why pay more?

Powell & Hanmer, Ltd

Makers of the finest Motor-cycle Lamps in the world.

R.H.S.

Will the Ultra-lightweight Return?

[6115].—I note in Mr. Roy Walker's letter (No. 6080) of the 23rd November, he states that in his opinion the best really small engines in the old days were the "Clément-Garrard." If this is so, where are they now, and why are the small early Motosacoches still running and giving the same satisfaction as they did when new? There are thousands of these little engines running in different parts of the world.

Mr. Roy Walker also thinks that motor cycle riding on the Continent is confined to short distances in towns; this is so, and it will eventually be so in this country as it is with pedal cycles, and I do not think Mr. Walker himself can dispute this idea.

OSBORNE L. DE LISSA.

[It is only fair to those who were associated with the Clément-Garrard Co.,—some of whom are still in the industry, to point out that the Clément-Garrard engines were only discontinued when the firm responsible for marketing them in this country retired from the motor cycle business.—Ed.]

[6116].—I have been interested in the correspondence between Mr. Roy Walker and Mr. De Lissa. I can understand, from Mr. Walker's muscular build, that he can perform the daily feat of lifting a so-called lightweight of about 140 lbs. weight up and down flights of steps, but we are not all of Mr. Walker's build, and there are motor cyclists to whom this daily feat would be harmful and even dangerous. Few managers of motor cycle works seem to realise that there are a large number of gentle folk who want a lightweight machine, not only for its handiness, but also to avoid the unpleasantness of being classed with the individuals whose one idea is to travel well over the legal limit.

H. BEADNELL, M.R.C.S.

Space at the Show.

[6117].—A good deal has been written and discussed by the public respecting the general tendency of large firms to form "trusts." In your leading article last week you said that exhibitors at Olympia were all satisfied. I should like to point out that the attitude of the authorities in connection with this Show is rapidly tending to turn it into a ring controlled by the larger manufacturers. Long before the exhibition took place, it was generally known that the whole of the spaces were booked, and I understand that even members of the Manufacturers' Union, not to mention rank outsiders who possibly had some new inventions or designs that they desired to place before the public could not possibly obtain any space, yet on the opening day what did we see? A few large firms in the main body of the hall, with huge stands, and in addition to these they have nearly the whole of the two side aisles devoted to their offices, thus debarring many newer and smaller firms from exploiting their ideas.

If this is to be a feature of future motor cycle shows, I think it will be better to remodel the old Stanley Show, and start it again with its old policy of being open to all comers.

AN INTENDING EXHIBITOR.

Belts and Bad Weather.

[6118].—With reference to Mr. E. W. Choldercroft's letter [6087] relating to my trouble with a leather belt at Luton Hoo, Mr. Choldercroft is rather hasty in using this example as a reply to the Service Co.'s letter [6000] without some explanation. It is very unfair to use an isolated case as an argument on general grounds. Though I failed at Luton Hoo in the passenger class, I have gained no fewer than fifty-three firsts this year, being placed no less than eighty-four times. I mention this to show that it is unfair to quote a solitary instance.

My wins have included defeats of shaft and chain-driven machines, so nothing can be argued from that, also under much worse conditions than at Luton Hoo. As Mr. Choldercroft was an interested spectator at Luton Hoo, he must well remember a heavy shower just before the commencement of the passenger class, which deluged the track.

Agreeing with him that a leather belt is better than rubber in wet weather, I hastily (perhaps foolishly, as the rubber could not have been worse) fitted a Service leather

belt in lieu of the rubber, forgetting the former had not been stretched sufficiently, especially for such a powerful engine. I had not even time to have a short spin for the belt to bed itself in the pulleys, consequently, at the first explosion, to my disgust, I had practically a free engine even on the down gradient at the start, which surely was readily discerned by all who were there.

The Service belt is excellent, but, like all leather belts, must be properly fitted, and it was owing to sheer carelessness on my part, added to hurried adjustments, that I experienced any trouble.

F. W. BARNES.

Lubrication of the Crank Pin.

[6119].—Being interested in the efficient lubrication of the big end bearings of motor cycle engines, I offer the following as a practical solution. At each revolution of the flywheels the oil holes in the connecting rod big end would receive a thoroughly efficient supply of lubricant in the following manner:

Illustrating letter
No. 6119.

perfectly.

As will be seen from the sketch, the idea is to fix to one half of the crank case—inside, or right in the centre—a strong tube to clear the insides of the wheels, the tube to be slotted on the top to allow oil to drain into it. The tube to contain wicks divided at the end and projecting about half an inch, to catch the crank pin during revolution and so leave a full supply of oil where required. The idea was put into practice on an old 1½ h.p. in the old days, and worked

H. WRESSELL.

Touring in South-west Wales.

[6120].—It may interest you and the writer of letter 6091, "BD 50," to know that I was just recently over the road he refers to on my 3½ h.p. two-speed Hummer, and well I know the horrible condition it is in, far worse than any stretch of road we had in this year's Yorkshire Six Days' Trial.

The road "BD 50" refers to is over part of the Black Mountains, and there are several roads like it in Wales.

The Newport side of Fishguard hill has a gradient of 1 in 4 at the steepest part, which my machine took comfortably on low gear.

With reference to "BD's" remarks on allowing competitors to cool their engines, I think this is only fair if the rider has been able to make up the time, and if he wishes to complete the trial it is only natural for him to "nurse" his engine as much as possible.

A. C. ROBBINS.

Carbon Deposits.

[6121].—With reference to my request in letter 6052 for half a dozen readers to send me samples of the deposits from their cylinders so that I could ascertain by analysis if the deposits contained a large proportion of road matter, the following is an analysis of carbon deposit sent me by a reader using the *nom de plume* "Archibald."

THE ANALYSIS.

Volatile oils and carbonaceous matter	... = 83.10%
Residual ash	... = 16.90%
Composition of ash:	
Silica	... 6.90%
Ferric oxide53%
Alumina	... 3.06%
Lime	... 5.40%
Magnesia	... 1.01%
	16.90%

The composition of the ash shows that it contained a large proportion of road matter.

Perhaps "Archibald" will explain what roads he used while deposits were collecting.

W. ELDER

Silence and Silencers.

[6122].—Being a regular reader of your paper, I am interested in letter 6099, signed S. W. Turner. Some two or three years ago I was under the same impression that it was next to impossible to prevent an engine overheating if the cut-out were not frequently used. At that time I rode a $3\frac{1}{2}$ h.p. Minerva, from which I got some very loud explosions through the silencer, finally bursting it. Then I purchased a new silencer from one of your advertisers. This I found was very efficient, so much so that I found my machine ran better with cut-out closed. This was no imagination, as many times did I test it on my pet hill, first with cut-out closed and then with it open. I always found it climb better with it closed. I do not know the name of the silencer, but it had aluminium balls between the two chambers.

"Ixon's" "Evolution of Transmission" is very interesting, and I think the time is not far distant when the belt will be defunct.

J. WEST.

[The silencer referred to was known as the Aldington.—Ed.]

Adjustable Jets.

[6123].—I am enclosing sketch (not to scale) of an adjustable jet I have adapted to my 1911 lightweight B. and B. carburetter. It is quite simple to make. Proceed as follows: Take out cleaning screw, and drill out the hole about $\frac{3}{16}$ in. diameter so that it just comes through the jet, which must be screwed tightly in its place. The hole in the jet must now be reamed out with a taper reamer. A taper plug is now made to fit and ground in. This plug is drilled up a little way, and four very small holes are drilled through round the circumference at intervals of 90°. These holes can be drilled to suit different engines. I drilled them .028 in., .029 in., .030 in., and .031 in. diameter. To keep the plug in good contact, and prevent leakage, I soldered on to the carburetter part of a tyre valve, inserted a small spring, screwed on the valve cap, and afterwards a handle to turn the plug, marking the positions of the holes outside.

This arrangement greatly facilitates starting, as the hole in the jet is large, and a good supply of petrol is in the jet before starting, no matter which size hole is in use. In my own case, one push of the pedal does the needful.

J. C. WHITELEY.

A Plea for the Cut-out.

[6124].—I should like to say that I heartily agree with the writer of letter No. 6099. In fact, "then's my sentiments" entirely. My lightweight twin will hum along very pleasantly with the throttle just open and the spark advanced, making very little noise even with the cut-out in use, much less noise, in fact, than the average $3\frac{1}{2}$ h.p. single, with cut-out closed. Then I can, like Mr. Turner, close down to absolute silence, so far as engine explosions are concerned, when meeting horses, or in towns. Of course, I get a sharp rattle on full throttle, but that is seldom required.

Another point is that a continued use of the silencer, which is fitted below the footrests, makes it unpleasantly warm for the right foot in the summer time. There is a certain class of rider who will always make himself objectionable in some way or another, viz., the class that was known as "Cads on castors" in the old cycling days.

Peace, peace, oh let us have peace!

Don't open your cut-outs too long,

When you go for a ride up the steep mountain side
In the beautiful valley of Bhong.

THE RAJAH.

Competitions in 1912.

[6125].—In last week's issue you state that the Herts County A.C. have booked eleven dates for their 1912 competitions, and that other clubs must take a back seat. May I point out that the Westmorland M.C.C. have applied for, and been granted, two permits for an open hill-climb and open speed trial, the former to have ten classes, the second about six. We are thinking of having an open reliability trial. Besides these open events we have thirteen club competitions of various kinds, and could have booked the dates of these competitions before the Olympia meeting, but were unaware that it was necessary. So if the W.M.C.C. have to take a back seat it cannot be very far back, if at all. May I add in conclusion that there are other clubs in the North with as large a programme as ours.

C. B. ROBINSON,

Hon. Sec. Westmorland M.C.C.

[Our correspondent has missed the point of our paragraph.

The meeting at Olympia was to arrange dates for important open events in order to avoid clashing. It was not intended to include ordinary club events in the programme; that was why we drew attention to the reserving by the Herts County A.C. of eleven different dates to themselves.—Ed.]

Hill-climbing.

[6126].—In reply to Mr. Railton's letter [No. 6066], I may say that I know the hill at Swythamley Park, between Leek and Danebridge, very well, being a native of the district. I rather fancy, though, that it is not quite so bad as 1 in 4 at the hairpin bend. I should say myself it was 1 in 7. My $3\frac{1}{2}$ h.p. Bradbury has a fixed gear of 6 $\frac{1}{2}$ to 1.

If Mr. Railton would try the climb from Wincle to Allgreave, past the chapel and up to "The Flash," he could then get on to the Macclesfield-Buxton road, and down to within two miles of Macclesfield; then by turning to the right he would be in Rainow, whence he could explore Kettlethulme.

I may say that I have not gone the whole round without failure. I have been many times, and had many failures, and I am out for information respecting a single-gear machine which, as Mr. Railton remarks, might have to "give up the ghost."

A. BURGESS.

Will the makers of the Spartan leather belt for motor cycles kindly communicate with the editor?

SUMMARY OF CORRESPONDENCE.

T. J. Williamson writes in strong praise of the treatment he has received from J. Pedley and Son, Ltd., Birmingham.

A. E. Smith, 1, Grand Parade, West Croydon, writes that he accomplished the same climb up Netherhall Gardens, with a $3\frac{1}{2}$ h.p. P. and M. and three passengers (weight 35 stones 4 lbs.), as was described in our issue of the 16th October.

AN ALL-WEATHER MUDSHIELD.

A special form of front mud ward made by the Auto Aero Co., Coventry. The guard is provided with a series of louvers which, whilst allowing air to pass to cool the engine, prevent the passage of mud and dust.

WONDERFUL WORK IN NOVEMBER!

A series of thrilling performances on

DUNLOP

TRADE MARK

MOTOR-CYCLE TYRES.

At Brooklands track, on 21st November, W. L. T. Rhys, on a $3\frac{1}{2}$ h.p. "RUDGE," fitted with

DUNLOP MOTOR-CYCLE TYRES

captured four World's Records for any size of engine, beating American times to a "frazzle." In five hours Rhys rode 268 miles 154 yards, and in six hours 322 miles, 603 yards.

Same day, same track, same tyres,

DUNLOPS

J. R. Haswell, riding a $3\frac{1}{2}$ h.p. "TRIUMPH," broke one British and four world's records—

124 MILES IN TWO HOURS

184 MILES IN THREE HOURS—

239 MILES IN FOUR HOURS.

THE TRIPLE-STUDDED DUNLOP is the speediest and safest motor-cycle tyre for all purposes and for all seasons.

W. N., Ross-on-Wye, writes—

“The machine continues to give great satisfaction. I have done up to the present about 3,000 miles (a good deal of it with sidecar and passenger), but have never yet unpacked the toolroll on the road or made any adjustment other than the pulley or belt.

I shall be pleased to give my experience to any enquirer. The machine I use in all weathers in my business and find she is very safe on grease, in fact I have never yet had a side-slip or let her over.

She runs smoothly and silently, and has never required any adjustment during the 6-7 months I have used her.”

Catalogues and full particulars free on application.

THE ROVER CO., LTD.,

COVENTRY.

SOMETHING more definite than the hand pump for the lubrication of motor bicycle engines is no novelty. It has not only been discussed in our columns more than once, but at least one maker has embodied the mechanically-operated pump in his lubricating system. This, of course, refers to the past. So far as the near future is concerned, it seems obvious that more general attention is to be given to really serious attempts to depart from the rather haphazard system which has been prevalent up to now. The specimens of mechanical lubrication shown at the recent Show at Olympia are more than sufficient to indicate this, and it may be interesting to consider the systems in use on motor cars.

Various Types of Mechanical Feeds.

It should be borne in mind that the motor car has gone through almost exactly the same transitional stages in regard to lubrication that it appears the motor bicycle will do. First of all, there was the hand pump, then the drip feed, and, lastly, the various types of mechanical lubrication now prevalent. These may be grouped under three main headings:

1. Pump and trough, with all the oil carried in the base chamber.
2. Constant level, in which most of the oil is carried outside the crank chamber, but is pumped in and out of it so that a constant level is maintained.
3. Internal forced lubrication, by which oil is forced through a hollow crankshaft to the bearings.

Pump and Trough.

This is, by far, the most widely used system on cars to-day. There are a number of detail variations, but the principle is practically the same in all. Under each big end bearing of the connecting rods a trough or gutter is placed, and this is kept filled to overflowing by either a gear pump or a plunger pump or pumps. Into the oil in the gutter a little pick-up finger or scoop on the big end bearing dips and throws it up to all parts of the engine from the gudgeon pin downward. In many engines with this trough lubrication, there are also catchpits for the main bearings, which are also kept filled to overflowing by the oil pump. The crank chamber is enlarged to carry anything up to a gallon of oil, according to the size of the engine, and a good many engines will run a thousand miles on a gallon or less. This system is perfectly satisfactory for well-designed car engines which run at moderate speeds.

Constant Level.

This is really a modification of the trough system, but the oil is not carried in the crank chamber, *i.e.*, no more is carried in the crank chamber than is necessary for keeping oil up to the level of the big ends. It is not only pumped in from the tank, but is also pumped out, and in some cases the oil pipes run to the main bearings, so that the oil is forced into them and then drops into the crank chamber. As soon as it rises above the proper level there, it is

pumped back to the oil tank. There is little between this and the previous system, though in many respects it is rather more suitable for high speed engines.

Internal Forced Lubrication.

The title in this case almost explains the system. The crankshaft is drilled, and oil is forced right through it to the main bearings and to the big ends, while in a few cases the connecting rods are drilled too or have light copper pipes running up them, so that the gudgeon pins also enjoy forced lubrication. There are many difficulties in carrying it out really well on a motor car, as, owing to the number of bearings and the length of the crankshaft, it is very difficult to arrange for anything like an equal supply to each of the many bearings. In most cases all the oil is carried in a sump in the crank chamber.

The Filtering Arrangements.

With all three of these systems a great deal of their success depends upon the filtering arrangements, as, when oil is circulated time after time round the engine, it follows that any grit, particles of metal, or other foreign matter in it should neither be forced nor fed into the bearings, but should be trapped by a filter. While this is essentially so in the case of the trough and constant level, it is still more necessary with internal forced feed, as it follows that, when oil is poured over the bearings, the grit will not in most cases go into them, but, when the oil is forced to them, grit and everything else it contains are forced between the revolving surfaces, and for this reason some car makers are opposed to the internally forced lubrication; they believe rather in the outside feeding trough or its modifications. Undoubtedly, so long as oil only is fed to the bearings, the internal forced lubrication is incontestably best, and, except for filtering difficulties, it is very much easier to carry out on a motor bicycle than on a motor car, simply and solely because the number of bearings is so much less, and it is therefore quite easy to adequately lubricate them all.

Cool and Hot Oil.

One point, however, that should not be overlooked in connection with hand pump lubrication is that every time a pumpful is injected, say at a critical moment on a steep hill, the lubricant enters the crank case in a fresh and comparatively cool state, and though in a few seconds it must become of the same viscosity as what was already in the crank case, the application of a fresh charge of cool oil will often spell success in climbing the hill. In the case of forced feed by mechanical rotary pump, the whole of the oil in the sump must pass through the engine in considerably less than a minute, so that it is always in a very liquid hot state. Car engines employing forced feed lubrication are often provided with radiator fins on the crank base to assist in keeping the crank case as cool as possible, so enabling the oil to retain its full lubricating properties.

A.C.U. Annual Dinner.

The annual dinner of the Union will be held at the Waldorf Hotel, Aldwych, W.C., on Saturday, January 20th next. Ladies are invited.

A.C.U. 1912 Handbook.

The A.C.U. handbook for 1912 is now in course of preparation, and the committee will be glad to have the names and addresses of any hotels or repairers that can be recommended by members.

Proposed Club at Wigan.

A preliminary meeting has been held and a number of motor cyclists have decided to form a club. A general meeting will take place on the 12th inst. at the Ship Hotel, Wigan. The hon. sec. *pro tem.* is Mr. J. Dawber, Standishgate, Wigan, who will supply information to prospective members.

Taking Time by the Forelock.

With admirable promptitude the Westmorland M.C.C. has issued the preliminary details of its open hill-climb next Easter Monday. The contest will be held on Brigsteer Brow, four miles west of Kendal, which is said to be a far better selection than Shap Fell used last Easter. Ten classes are included on the programme, including one for quadcars and runabouts.

Tourist Trophy Races.

The A.C.U. General Committee has accepted the recommendation of the Competitions Committee, and has fixed the engine sizes for next year's Tourist Trophy as follows: Junior race for any type of engine having a cubic capacity not exceeding 350 c.c. Senior race for any type of engine having a cubic capacity not exceeding 500 c.c. June or September are the months chosen for the race, which, subject to the necessary permission being obtained, will again be held in the Isle of Man.

Road Dangers at Night.

Another fatal accident occurred at Radcliffe, near Nottingham, on the 28th ult., due to cattle being driven on the road without a warning light. A taxicab suddenly came upon a man in charge of six beasts. The driver of the cab had to stop suddenly, over-turned the vehicle, and was pinned underneath. The jury returned a verdict of "accidentally killed," adding a rider that "persons driving cattle on the highway after dark should carry a light by way of warning." Let us hope that this sensible rider will cause the authorities to introduce some fresh legislation compelling the use of warning lights by drovers.

The All-night Rides.

Competitors in the various winter reliability runs this Christmastide are urged to run their machines as silently as possible, especially during the night, when passing through villages and towns. We may also point out that steps are being taken by the Motor Cycling Club to detect any unnecessary noise that may be made by the machine of any participant.

Red Warning Barriers.

Since the collision with a barrier sustained by H. T. Lloyd, of the Triumph works, whilst tuning up for record at Brooklands, the authorities are painting the barriers red. Hitherto they have been painted white, and consequently did not show up on the concrete track. By the way, Lloyd is back in Coventry and out and about again.

The Triumph Two-speed Model.

One day last week we received a visit at our Coventry offices from Miss B. Langston, who is well known to our readers as an enthusiastic sidecar driver. She had come all the way from Edinburgh to see the Show, and on her way back she and the Rev. P. W. Bischoff had called at Coventry to try the new Triumph two-speeder, reference to a trial of which, it will be remembered, has already appeared in *The Motor Cycle*. It was a pouring wet day, and only very keen riders would have turned out in such weather, but, of course, it was all the better for testing purposes. In spite of the wet and the short belt drive, they informed us they did not experience the slightest belt slip, even when taking Stoneleigh hill "all out" on the low gear. On the other hand, they found it not easy to pick up from low to high gear, owing to the big difference between the two ratios. Miss Langston herself was very emphatic in stating that she personally preferred driving their own well-tried T.T. roadster model, even with sidecar, but we could not get her to give her reasons.

SPECIAL FEATURES.

WINTER MUDGUARDING.

TWO'S COMPANY:

A CRITICISM OF 1912 PASSENGER MACHINES.

MECHANICAL LUBRICATION.

Suggested Club for Wimbledon.

All motor cyclists living in or near Wimbledon are invited to write to Mr. E. P. Lyon, 31, Queen's Road, Wimbledon, with a view to holding a meeting to discuss the formation of a local club.

Proposed New Club for Liverpool.

It has been suggested by several Liverpool motor cyclists, that there is now plenty of room for another club in Liverpool. Will other Liverpool readers who are of the same opinion kindly communicate with Mr. C. E. Eastwood, 42, Clifford Road, Seacombe, Cheshire.

French Hill-climb.

Several entries have been received for the hill-climb organised by the A.C.C. de France and down for December 17th. Among others are the Mototri-Contal, a tri-car already fairly well known to our readers. La Ponette, described and illustrated last week, is also among the makes of machines entered.

Motor Cycle Taxation.

We have received complaints lately from several readers that they have been asked by the Local Taxation Licensing Authorities to pay a 10s. 6d. extra tax for a sidecar. We are authorised by the legal adviser to the A.C.U. to state that he will gladly take up any test case fought to settle this point and defend the applicant free of charge. Letters on the subject should be addressed, Legal, c.o. the Editor, *The Motor Cycle*, 20, Tudor Street, E.C.

Kick-starting Devices.

The term "kick starter," which was a name first given by *The Motor Cycle* to the Scott device when that machine was introduced, has been generally accepted for all types of foot-starters, but in reality some are not "kick" starters. A rearward push—really a kick—is required with the Scott, Douglas, Clyno, Bradbury, and others, but a push forward motion is necessary on the Indian, James, and P. and M., so that "foot-starter" is a better term for the latter class of engine starter, and is correct for all types.

Proposed Club for Brighton and District.

We hear from Mr. H. Winton, London House, Lancing, that he has been approached by a number of enthusiastic motor cyclists with a view to the formation of a club for the neighbourhood—in fact, if possible, a Sussex M.C.C., to provide facilities for hill-climbs, reliability trials, etc. All riders (both sexes) who are interested should write to Mr. Winton for particulars.

HAVING DECIDED

very special second-hand machines. ALL have been overhauled and the condition in most cases is as new.

1911 F.E. TRIUMPH, many spares £42
 1911 Tourist REX, cost 43 guineas: 37 gns.
 1911 Standard BRADLEY, unscratched £40
 1911 F.E. RUDGE, like new £42
 1911 F.E. SINGER, exceptionally good £42
 1911 Tourist BAT-J.A.P., 3½ h.p. £38
 1910 Speed King REX, 5 h.p., fast £36
 1911 2 h.p. HUMBER, only soiled £33
 1911 Standard BRADBURY, shop-soiled £44
 1911 Twin WANDERER, brand new .. £37
 1910 Lightweight N.S.U. £18
 1911 WANDERER, single-cylinder,
 brand new £32
 1909 MOTO-REVE, excellent condition £19
 1910 1½ h.p. WANDERER, beautiful
 order £24
 1910 Standard TRIUMPH, lamp, tools,
 etc. £28
 1911 DOUGLAS Model E, 2-speed, free
 engine £40

1910 V.S., 2-speed, free engine, semi-
 castor wheel sidecar to match, speed-
 ometer, etc., etc. £46
 1910 SCOTT, speedometer, tools, very fine £42
 1910 5 h.p. INDIAN, 1911 clutch, perfect £41
 1910 ROYAL ENFIELD, like new £26
 1909 P. and M., just overhauled £37
 1910 Twin WANDERER, spring frame.. £26
 1910 5 h.p. Tourist REX, almost new .. £37
 1910 Standard TRIUMPH, thorough
 order £34
 1910 DOUGLAS, all accessories and tools £25
 1910 F.N. Lightweight, 2 speeds, free
 engine £25
 5 h.p. BAT-J.A.P., magneto, Bat sidecar £27
 1911 Standard BRADBURY, as new £37 10
 1909 BRADBURY, with 1911 cylinder
 and piston, 2-speed gear £34

1910 SCOTT, with 1911 improvements.. £39
 1911 REX DE LUXE, 5 h.p., and Mills-
 Fulford 1911 spring wheel sidecar, a
 fine combination £45
 1911 NORTON T.T., Cap carburetter .. £40
 1911 2-speed 7 h.p. INDIAN, with side-
 car, accessories, and spares £60
 1911 2-speed 7 h.p. INDIAN, fine and fast £43
 1911 MOTOSACOCHE, a little beauty.. £33
 1910 CHATER-LEA-J.A.P., 1910 B. and
 B., good £17
 1910 WOLF Lightweight, almost new .. £14
 1910 (late) SCOTT, excellent order £37
 1909 Tourist REX, Triumph carburetter £24
 1908 REX DE LUXE, 5 h.p. Bosch,
 2 speeds, free engine, spring forks.. £20
 1910 REX DE LUXE, steel-studded tyre £35
 Several Accumulator Machines at Clearance

2 DREADNOUGHT MOTOR CYCLE TYRES

The most comfortable Saddles in the world—because the only ones designed on Scientific Principles.

Registered No.:
581476;
and Patents:
7289 and 8215.

“LYC0” No. 1—The Seat-Pillar Model.

Registered No.:
558 476;
and Patents:
7289 and 8215.

“LYC0” No. 3—The Pan-Seat Model.

“Echoes of The SHOW”—

—All visitors to Olympia will remember these outstanding units of

“The Good 1912 LYCETT Lines”

and the wealth of interesting and valuable items for cyclists and motor cyclists exhibited at our stand there.

—All who did not visit us should now write for “The Saddle Book,” and if you are a motor cyclist, or thinking about becoming one, don’t fail to ask for our Special Art Folder “Worth Looking Into”—it doesn’t belie its title, and it contains interesting details invaluable to our motor cycling friends.

—“LYCETT’S LINES” are obtainable of all Agents, Garages, etc., or direct.

**LYCETT’S, “The Saddlery,”
Bromley St., BIRMINGHAM.**

The Belt used by all the record-breakers.

LYCETT’S New Tool-Bag. with patent hook fastening and patent lock.

The 1912 Fixture List.

September 7th is the date of the Streatham and District M.C.C. open hill-climb, not September 1st as printed last week.

Cinematograph Show at Olympia.

The Committee of the Cycle and Motor Trades Benevolent Fund reports that a net profit of £31 11s. was made on the cinematograph performances during the Motor Cycle Show at Olympia.

Brooklands Tennis Courts.

New tennis courts have been laid at Brooklands adjoining the paddock. To celebrate the opening of the courts last Saturday, a number of leading players gave a series of exhibition matches.

The Wonderfully Efficient Single Cylinder.

No less than twelve of the fifteen records credited in Class D to engines of 750 c.c. capacity have been captured by riders of 500 c.c. single-cylinder machines. In Class E for 1,000 c.c. engines, single-cylinder $3\frac{1}{2}$ h.p. machines claim ten records.

The Bradford Club's Trial Abandoned.

The proposed Bradford M.C.C. winter trial to Barnet is not likely to materialise after all. The committee have arrived at the conclusion that the North-country man having a great affinity for his Christmas dinner would not feel in such form as to set out on a cold twenty-four hours' ride. Even the attractions of the North Road are not to be compared with the home circle on Christmas Day.

The Exeter Run.

Quite a number of new names were before the M.C.C. Committee last Monday evening for election as members in order that they might take part in the winter run to Exeter. Mr. E. B. Dickson, the trials hon. sec., journeyed over the route last week-end in order to make final arrangements for the convenience of the competitors. This year Mr. Dickson will ride his new 8 h.p. Bat-Jap in the trial.

S. W. Woolford, of the Southampton and District Motor Club, who has been the holder of the Oakley Cup for the last three years. He now becomes the owner of the trophy.

FUTURE EVENTS

- Dec. 9.—M.C.C. Annual Dinner at the Café Monico.
 " 26-27.—M.C.C. Winter Reliability Run to Exeter and back.
 " 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.
 " 30.—North West London M.C.C. Twelve Hours' Winter Reliability Trial.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

A Continuous Winter Trial.

The Birmingham Club's "all-weather" riders continued the third autumn reliability trial last Saturday, two of the three starters again accomplishing non-stop runs. These two riders will contest the fourth round next Saturday.

French Road Racing.

The Paris-Havre road race, which was organised by the Motor Cycle Club de France, and stopped by the police on November 26th at the moment the competitors were about to set out from St. Germain, has resulted in a course being selected in the neighbourhood of Paris. On Sunday last twelve motor cyclists started for Melun, but, owing to heavy rain and bad roads, two only went round the circuit, which was reported to be in fairly good condition considering the time of year. The only thing now remaining is to secure the permission of the Prefect of the Department of Seine and Marne, in which the course is situated. If the necessary sanction be obtained, the race will take place next Sunday, twenty-eight entries having been secured up to Tuesday last, and further entries will be accepted up till to-morrow (Friday).

North-west London Club's Annual Dinner.

About eighty members and friends attended the annual dinner and distribution of prizes at the Richelieu Palace Hotel on Saturday evening last. Mr. Victor Hart (president) was in the chair, and Mrs. Hart gave away the prizes amid great enthusiasm, particularly when Mr. F. A. Rose went up to receive the Circuit du Rhone cup and gold medal which he won at the International contest between the N.-W.L. and Lyons clubs in August last. Mr. Rose will be leaving England on the 10th inst. for Sydney, where he has decided to settle down, so he will be unable to defend his title to this trophy or the Thomas Challenge Cup, of which he is also the holder. Among the speakers were Messrs. V. Hart, F. Straight, J. W. Thomas, A. J. Dreydel, and C. A. Stern.

Saturday's M.C.U.I. (Ulster Centre) Winter Run from Belfast to Derry. Competitors awaiting the signal to start from Fortwilliam Park, Belfast.

T.M.C. DEVELOPMENTS.

THE 1912 7 h.p. T.M.C. motor bicycle will, when ready for the road, be a striking contrast to the 1911 T.A.C. The engine has been entirely reconstructed and is a revolution in motor cycle design. The engine is water-cooled and has four separate cylinders 60 x 75 mm., the circulation is by pump, and the radiator, carried forward of the power unit, of the gilled tube type. The flat-faced valves are half the diameter of the cylinder bore, and, therefore, are of ample size. The valves are arranged side by side, and the tappets are adjustable.

The crankshaft is a fine piece of work, and is supported in three long white metal bearings, and over each bearing there is a well in which the oil collects. The crank case is provided with divisions to allow of a sufficiently high level of oil in which the connecting rods may dip when the machine is ascending or descending a steep hill.

The oil feeds by gravity through a sight-feed lubricator to the crank case, and any excess is returned to the reservoir by means of a pump. The carburetter is carried on the off-side of the engine, and the inlet pipe passes between the two inside cylinders and leads to the cast aluminium branch bolted up to the inlet ports. We understand that the carburetter to be employed

Sparking plug terminal on the F.N. introduced to obviate short circuiting.

will be the new Stewart-Precision described and illustrated in our last issue. The flywheel is of much larger dimensions than formerly, and embodied with it is a leather-to-metal cone clutch of the latest type with spring buffers under the leather to allow the drive to be taken up sweetly.

Car Practice 1 throughout.

The ball bearing three-speed gear box has been made larger, and has been improved in detail, and on the top the

The new water cooled cylinder of the 1912 T.M.C., which, as will be seen, has mechanically operated inlet valves.

smallest size four-cylinder car type Bosch magneto is carried in the usual strap fastening. The gear box inspection lid is therefore at the side. From gear box to rear wheel the final drive is by cardan-shaft and bevel. The bevel gear is independent of the rear wheel, and can be removed from it without disturbing

the rear wheel adjustment. The makers tell us it has been substituted for the worm on account of it being less wasteful of power.

The frame has been altered for the 1912 model, and the down tube, bottom tubes, and saddle tubes are duplicated. This forms a rigid support for the engine, and the two bottom tubes being detachable allow the engine, gear box, and magneto to be easily removed from the frame. The crank case clearance is 7 1/2 in., which should especially appeal to colonial riders.

As regards general appearance the new T.M.C. has not been greatly altered. The driver's seat has been tilted back slightly to afford a more comfortable position, the same excellent rear suspension on laminated springs has been retained, but the front forks will be the Druid. The stand will be carried beneath the saddle tube.

The machine, which was not completed on the occasion of our visit, is the first of a new batch, and it has some months of hard testing to endure before its successors will be placed on the market. Future models will have the camshaft driven by a silent chain. Special lugs are supplied for the attachment of a sidecar, and the frame has been strengthened with this object. Being water-cooled, the machine should be reliable, fool-proof, and capable of maintaining its power for long periods, and is, in consequence, eminently suitable for passenger work.

The thumb wheel controlling the jockey pulley on the Moto-sacchoe.

Sphinx Specialities and a New Overall.

New Detachable Sparking Plug.

A particularly interesting sparking plug was shown on the Sphinx Co.'s stand at Olympia. The principal feature is that the porcelain insulator is readily detachable for cleaning purposes without necessarily removing the body of the plug from the engine. As shown in the accompanying sketch, the porcelain is provided in its centre with a brass collar,

New Sphinx detachable sparking plug.

which is mechanically spun on its base into a groove formed in the porcelain itself. The joint so formed is perfectly gas-tight. The joint between the insulator and body of the plug is a metal-to-metal one, the gland nut being internally coned and seating upon the conical brass ring, and forcing a collar thereon to seat in the

plug body. This new plug is designed to stand very hard usage on high compression engines, and accordingly the central electrode is of very generous proportions.

Insulated Terminal Cap.

Another article which attracted our attention was the Sphinx sparking plug terminal cap, consisting of a metal tube covered with a rubber insulator, and split to form a spring clip. Underneath the ordinary terminal nut is placed a small collar, shown separately in the sketch, and into this ring springs a projection punched out of the split tube above mentioned.

Insulated quickly detachable terminal.

At the end is a spike with a thread cut on it, which is pushed into the centre of the high tension cable, so making a good joint and electrical contact at the same time.

Quick Detachable Overalls.

Who has not yearned for an overall legging that can be rapidly removed? The accompanying illustration of the Autoclos overall shows the new fastening fitted to the lower part. By pulling down

The Autoclos overall fastening which is being sold by the Service Company.

the ring shown in the enlarged drawing, the two edges of the legging are drawn together. They are undone by merely pulling the edges apart by hand, starting from the foot.

Mr. Arthur Candler, late Secretary M.C.C.

WHEN the news became public of Mr. Candler's resignation from the secretaryship of the M.C.C., and that a testimonial was being got up on his behalf, we arranged an interview with him at the earliest opportunity.

"Were you a founder member?" was our first shot.

"No," he responded. "The club started in 1901, and I did not join till 1903. There was not much doing in the M.C.C. in its early existence."

"And what were you doing meanwhile?"

I? Oh! I had got the fever even in those early days, and was even then looking round and trying things—weird little articles they were, Singers with engines in the back wheel, and that sort of thing—and I finished up with buying a 'one and something' Quadrant—one of the early reliable motor bicycles."

"And what sort of vehicles were the M.C.C. members using in 1901?"

"De Dion tricycles and similar mounts, while a few front-driven Werners and Singers were creeping in."

"1903 seems a long way back," we said. "Let us see, G. E. Roberts was secretary and Ernest Arnott was captain?"

"Yes," replied Mr. Candler. "Roberts was about to give up his post, Arnott also his. Then Horace Reeves became secretary. Only a few days after I joined I was elected to the committee."

Originator of the London-Edinburgh Run.

"Did you hold any official post that year?"

"No, but what I did was to encourage the founding of a special sub-committee to start the London to Edinburgh run, of which I had dreamed for months, and I hoped would soon be realised. Members were not very keen on it then, and once I remember they nearly—very nearly, but not quite—carried a resolution that the run should be divided into two sections—6 a.m. to 6 p.m. the first day, London to York; 6 a.m. to 6 p.m. the next day, York to Edinburgh. This I thought would not be nearly such a good advertisement for the motor cycle, and I stuck out against the resolution and won the day."

"What was the membership of the club when you became secretary in 1904?"

"About 100, and now it is nearly 400."

"Yes," we ventured, "the club has gone from strength to strength under your guidance, and you ought to be proud of your achievements."

"It is good of you to say so," the interviewed one modestly replied. "The membership is not so bad, considering we have abolished the reduced subscription for country members. You see people used to pay their 10s. 6d. entrance for the Edinburgh run and then vanished. They were no good to the club."

"Did you take any active part in the other club competitions beside the London to Edinburgh run?"

"Yes, I had a good deal to do with the Land's End and Exeter competitions."

"And their success," we ventured, "shows the effect of your influence."

Mr. Candler was modestly silent.

"I'll tell you one thing," he said, "and that is I have set my face sternly against Sunday competitions. I do not think it looks well for motor cyclists to ride about with numbers on their backs on the day of

rest, and though some of the younger members are keen on Sunday events I will have none of them."

"Perhaps," we suggested, "you can do something to influence your members to ride silent machines?"

"That I will gladly do. We have done all we could in the past, but we will do more. It is most important, especially during night competitions."

Seven Years' Great Work.

"We must offer our congratulations on your splendid work for the club," we said.

"Many thanks," replied our victim. "You join your kind words to many others I have received. My resignation a month ago as honorary secretary came quite as a surprise, and many kind people expressed their regrets. Seven years at this post has been a long time. Many spare hours have I spent over the work, and, without speaking egotistically, I may tell you I have tried to treat the post as if it had been a salaried one. It has not been all smooth going. Five years ago we went through a troublous time."

"Yes," we interrupted, "you did, and you pulled the club through splendidly; however, we will not prolong your agony, but wish you success in the new work you are undertaking."

Mr. Candler has taken a life-long interest in sport of all kinds, and it is to look after a social and sporting club for employes in the Bank of England, where he holds an appointment, that Mr. Candler has left his post in the M.C.C.

Mr. Arthur Candler, the retiring secretary of the Motor Cycling Club.

M.C.C. WINTER RUN TO EXETER.

Entries for the Motor Cycling Club's second annual twenty-four hours run to Exeter and back are already assuming large proportions. The list to date is as follows:

L. A. Baddeley (7 Indian and sc.)	Roy Walker (2½ New Hudson)
W. Cooper (3½ Bradbury)	B. Alan Hill (3½ Rudge and sc.)
H. E. Hull (7 Indian and sc.)	A. R. Abbott
W. H. Wells (7 Indian and sc.)	R. Owen Wells (3½ Bradbury and sc.)
Hugh Gibson (3½ Bradbury)	W. F. Guiver (3½ Rudge)
J. W. Woodhouse (3½ Grandex-Precision)	E. G. W. Hughes (8 Chater-Lea and sc.)
Stanley Webb (3½ Bradbury)	W. Pratt (3½ P. and M.)
H. Karlake (3½ Rover)	H. Foote (8 Bat)
P. M. Bentley (3½ Triumph)	W. H. Elce (3½ Rudge)
R. O. Clark (5 Indian)	C. Q. Roberts (3½ Rover)
Geo. Brough (6 Brough runabout)	T. M. G. Chapman (3½ Arno)
W. H. Eggington (6 Zenith and sc.)	A. P. Dickinson (3½ Triumph)
W. A. Sale (7 Indian)	E. C. Mather (5-6 F.N.)
W. T. W. Wartnaby (3½ W.D.)	C. Patteson (6 Zenith and sc.)
V. Olsson (6 Trump-Jap)	H. Patteson (3½ Triumph)
	V. Wilberforce (2½ Douglas)

C. W. Fox (3½ Rudge)	A. L. Ommaney (3½ Rudge)
E. B. Dickson (8 Bat)	J. Chater Lea (Chater-Lea)
G. T. Gray (3½ Rudge)	H. G. Bell (F.N.)
F. Russell Cooke (3½ Rudge)	Eli Clarke (2½ Douglas)
W. P. Tippet (—)	

MIDLAND WINTER TRIAL.

Last week Mr. Cecil Peers suggested in these columns an open winter reliability trial starting from the Midlands. The Birmingham M.C.C. last week-end decided to hold an open reliability trial on Wednesday, December 27th, under the new A.C.U. open trial rules and supplementary regulations. The route will be to York and back, *via* Nottingham, Mansfield, Doncaster, and Tadcaster. Entry fee for non-members, 10s. 6d.; for members, 7s. 6d. Gold medals will be awarded to those competitors who are not more than one minute early or late on their schedule times at each control. Silver medals will be awarded to competitors not more than four minutes late or early at each control. Times will be taken from riders' own watches, which will be enclosed in sealed cases. There will be time checks at Nottingham, Doncaster, and York on the outward and homeward journeys. Entries close on the 16th inst. at ordinary fees, 20th inst. at double fees. Entry forms may be obtained from Mr. R. Vernon C. Brook, hon. sec., Oakdene, Cambridge Road, King's Heath, Birmingham.

CLUB NEWS.

Mid Bucks M.C.C.

The first annual dinner was held at the King's Head Hotel, Aylesbury, on the 30th ult. Thirty-three members have joined the club since its inception in June. A trophy is being subscribed for, and the prospect is very hopeful.

Nottingham and District M.C.C.

In connection with the above club a whisk drive was held at headquarters, the Welbeck Hotel, on Friday last. A good number were present, and a very pleasant evening was spent. The annual dinner and presentation of prizes will take place on the 16th inst.

Liverpool A.C.C.

The annual dinner will take place at headquarters, the Bee Hotel, St. John's Lane, Liverpool, on Monday, December 11th, at 7 p.m. Tickets, 3s. each, may be obtained from the assistant secretary, Mr. C. Hobbs, 9, Huskisson Street, Liverpool. The chair will be taken by Mr. Percy Butler, and an excellent musical programme has been arranged. The assistant honorary secretary, Mr. C. Hobbs, 9, Huskisson Street, Liverpool, will be glad if club secretaries would send him, as early as possible, their names and addresses, also the names and addresses of secretaries of clubs in their districts, as he has on behalf of the above club an important communication to make to them.

Manchester M.C.

The annual dinner and distribution of prizes was held at headquarters, the Albion Hotel, Piccadilly, Manchester, on Friday evening, the 1st inst. The distribution of prizes won during the year followed. There had been six competitions in all during the season as well as a very successful gymkhana in September (for which prizes were then presented on the ground), and the chief successful competitors were: Messrs. E. V. Stevens, W. Heaton, C. E. Kettle, S. W. Phillpott, H. J. Scales, Hugh Gibson, J. A. Bottoms, H. Bottoms, Percy Butler, A. J. Moorhouse, F. Sirett, F. Taylor, jun., Percy Platt, J. Eastwood, W. Houghton, R. Birkett, G. H. Wilson, D. Sykes, J. Anderson, Harry Reed, and J. L. Timperley. There were a few toasts, such as "Our Guests" and "The Club." The Chief Constables of Manchester and Salford had been invited, but were both unable to attend the dinner, though Captain Godfrey (Chief of Salford) put in an appearance later. Other guests present were T. W. Grace, Esq. (President Manchester Automobile Club), F. W. Hatton (Automobile Association and M.U.), and representatives of the local press. The artistes and entertainers were all excellent, and included Outhbert Allan, Olly Oakley, Ernest Hastings, and A. Ainsworth. A comedietta was also presented and hugely enjoyed. The evening was brought to a successful termination by a dance.

Sutton Coldfield A.C.

The annual reliability trials will be held on December 16th and 17th. The start will be made on December 16th from the corner of Anchorage Road and Lichfield Road at 2.30 p.m.; December 17th, Parson and Clark Hotel (Chester Road), at 10 a.m. prompt. Competitors will be started in pairs at one minute intervals. Route: December 16th—Club standard course (Lichfield and Tamworth), to be covered three times. Tea at Royal Hotel after second round. Times will be taken each round at Castle Hotel, Tamworth, and corner of Anchorage Road and Lichfield Road. December 17th—The route will be to Ashbourne, *via* King's Bromley and Sudbury, where lunch will be taken at Green Man Hotel, returning to headquarters for the finish. At some point between Lichfield and Ashbourne there will be a secret check, which will only be used in case of a tie between any of the competitors. Speed, 20 m.p.h. Marks for the "Muratti-Ariston" trophy will be awarded in this competition. Prizes: 1st, "Sutton" challenge cup and gold medal (cup to be won three times); 2nd, gold medal, kindly presented by the Triumph Cycle Co.; bronze medals to all those making non-stop runs and finishing to time. A prize for the best performance of a novice will be awarded provided three or more enter.

Motor Cycle Union of Ireland (Ulster Centre).

The Ulster Centre of this Union held the first of its winter reliability runs on Saturday, the 2nd inst. Previous to the event the weather was most unfavourable, and this told greatly against the entry. The course was Belfast to Derry, a distance of seventy miles. There were several checking stations *en route*, and marks were allowed for competitors riding to schedule. Deductions were made from the same for mechanical stops, punctures, side slips, and several other causes, and consequently the result cannot be announced until the figures are fully verified by the committee. The following started in the midst of a heavy drizzle of rain, which continued during the entire journey: J. Stewart (3½ Triumph), L. MacLaine (3½ Triumph), J. Lavery (3½ Triumph), J. J. Kennedy (3½ L.M.C.), J. R. Thompson (3½ B.S.A.), W. F. Adams (3½ B.S.A.), R. M'Lardy (3½ Triumph), Gordon Simpson (3½ Triumph), and C. R. Martin (3½ Triumph).

The results of the series of quarterly trials have now been officially declared, and out of the twenty-one riders who took part three only qualified for gold medals, viz.: J. Stewart (3½ Triumph), 99.52%; B. S. Capper (3½ Triumph), 97.68%; C. W. Grogan (3½ Triumph), 97.62%. Silver medals were won by W. J. Chambers (3½ B.S.A.), 94.39%, and L. MacLaine (3½ Triumph), 93.33%. The following were the winners of different trials: 1, J. Stewart (3½ Triumph); 2, C. W. Grogan (3½ Triumph); 3, L. MacLaine (3½ Triumph); 4, W. J. Chambers (3½ B.S.A.).

B.S.A.

MOTOR BICYCLES

FOUR MODELS FOR 1912 —

For the 1912 Season, Two New Models have been introduced—the Two-speed Free Engine and "T.T."—and the high standard of quality which has made the name B.S.A. world-famous is fully maintained in every detail. **EVERY PART IS INTERCHANGEABLE**, and in the event of loss or damage, replacement can be readily obtained. The various constructional refinements are fully illustrated and described in the new book of the B.S.A. Motor Bicycle.

The "Daily News"—

"Will take some beating."

"Westminster Gazette"—

"The B.S.A. Machines are matchless pieces of workmanship."

"Glasgow Citizen"—

"Thoroughly practical, built of the very best material and beautifully finished."

The Prices of B.S.A. Motor Bicycles are:

MODEL A—With **fixed engine** and fitted with pedalling gear £50 0

MODEL B—With **free engine** and double cone clutch in back hub; pedal starting from saddle £56 10

MODEL C—With **free engine and two-speed gear** in back hub; gear operating by foot lever, which can be locked by control lever on handle-bar £60 0

MODEL D—**Tourist Trophy**; without pedalling gear, fitted with 26" x 2½" Dunlop tyres, semi-racing handle-bars; wheel-base 3½" shorter than standard £48 10

Some of the cups and prizes awarded to winners of various competitions organised by the Dublin and District M.C.C. this year.

Wolverhampton M.C.C.

The first annual smoking concert and presentation of prizes will take place at headquarters on Monday, December 11th, at 8 p.m.

Ayr and District M.C.

The fourth annual dinner was held at the Ayr Arms Hotel on the 28th ultimo, and was followed by the presentation of prizes. The president's silver cup was won this year by G. Cocker, with an aggregate of 576 out of a possible 600. J. Gilchrist and G. Clark totalled 544 and 473 respectively.

Western District M.C. (London).

A most successful supper was held on Wednesday of last week. The events of the evening included the annual prize distribution and a most enjoyable musical programme. The banjo duets led by Mr. Butler were much appreciated. All thanks are due to Mr. M. Tweedie for his energetic efforts in connection with this event.

North Middlesex M.C.C.

Applications for membership will now be received, subscriptions to date, as from February 28th next. Special insurance rates have been obtained for the benefit of members, and those interested are invited to apply for full particulars to the hon. secretary, Mr. D. Grey Blakey, "Heathfield," (Great North Road, Highgate, N. The first club dance takes place to-morrow (Friday) evening at headquarters, the Olde Gatehouse, Highgate; evening or fancy dress.

Newcastle and District M.C.

A well-attended whist drive took place in the Club House, 3, Saville Place, Newcastle-upon-Tyne, on Thursday of last week. Supper was served during the course of the evening in the reading room.

Dublin and District M.C.C.

The annual dinner of the above club was held on Saturday last, when Dr. Burke Kennedy, the vice-president, presided over a gathering of eighty members and friends. The club has had a most successful season, and the cups and prizes which were distributed during the evening numbered upwards of eighty. Some interesting and witty speeches were delivered, notably by J. C. Percy and T. W. Murphy, representing the "Motor Press," and by F. A. Wallen, representing the "Trade," and these, together with a lengthy musical programme, prolonged the evening to a late hour. A suggestion that the club should organise a motor cycle gymkhana at one of the skating rinks was well received.

Southampton and District M.C.

The annual dinner took place on the 29th ult. at Scullard's Hotel, after which the prizes won during the season were presented, Messrs. S. W. Woolford, S. Docking, C. Prince, S. I. Rodgers, W. Tuffin, and H. P. Young being the recipients. The evening closed with a musical entertainment.

Bristol M.C.C.

A new club was formed on Wednesday, November 29th, in Bristol with the above title, at a most enthusiastic and crowded meeting at the Royal Talbot Hotel. This club has been formed purely for the development of motor cycling only, and a large programme is in store for next year in the shape of open hill-climbs, long and short distance trials for medals and cups, inter-club runs, and fixtures of a social character. The officers elected were as follows: Chairman, Dr. Llewellyn, captain, Mr. F. C. Wasley; hon. treasurer, Mr. J. B. Kellar; hon. sec., Mr. Philip Grout. Headquarters are at the Queen's Hotel, Clifton, and the next meeting will be held on Tuesday, December 12th, at 8.30 p.m. The hon. secretary's address is Warmley, near Bristol.

Birmingham M.C.C.

Only three of the four survivors in the autumn reliability trial put in an appearance on Saturday last, viz., R. W. Duke (3½ Zenith), R. H. Edwards (3½ Triumph), and V. Busby (3½ two-speed Humber). The course was Birmingham, Stratford, Sunrising Hill, Round Tower, and back *via* Stratford and Alcester. Busby failed on Sunrising. Duke and Edwards made non-stops. H. G. Dixon was in London and could not turn out in consequence. The fourth round starts from the Fountain, Hagley Road, at 3 p.m., Saturday.

The ninth annual dinner will be held at headquarters on January 5th.

PROPOSED ABOLITION OF CUT-OUTS.

INSPECTION BY THE LOCAL GOVERNMENT BOARD.

READERS will remember that we recently announced that the Local Government Board had decided to formulate regulations which would prohibit the use of cut-outs on all motor vehicles. The Board has conferred with the motor organisations on the subject, and in connection with cut-outs on motor cycles a representative from Whitehall visited Coventry last week and had demonstrated to him the difference in sound produced by the exhaust issuing from silencers with cut-out open and closed.

Mr. Thomas C. Ekin, who was the L.G.B. representative, visited Rudge-Whitworth, Ltd., and a party consisting of one of the directors, the works manager, and six motor cyclists mounted on machines fitted with different silencers went with Mr. Ekin along the Warwickshire lanes. The L.G.B. representative was keenly interested in the machines used for the demonstration, and asked many questions. One was with regard to the cubical contents of the silencer. He said he wished to know if size of the silencer made very much difference to the noise, and if the Board were to specify a silencer of a certain cubical content whether it would overcome the difficulty and render machines quieter. He was informed that actual size was not so important as the design of the timing gear and the contour of the cams. This was instanced in the case of one of the Rudge machines, which was fitted with quick-lifting cams to an otherwise standard engine and silencer. The exhaust from this engine was very much louder than the other five machines employed for the demonstration.

The machines tested were: (1) A standard 1912 model. (2) A standard with silencer 1 in. larger in diameter, made by placing the standard silencer inside a case, the interstices being filled in with sand; this was fairly quiet. (3) A machine fitted with an engine with

quick-lifting cams. (4) A T.T. model with long exhaust pipe extending to the rear with pepper box end. (5) A T.T. with conical-shaped horizontal silencer; this was quiet but caused back pressure. (6) A 1911 standard machine.

Mr. Ekin, who thanked the Rudge-Whitworth Co. for their courtesy, pointed out that the Board did not desire to do anything which would hamper a new and growing industry, and that whatever restrictions were placed upon the use of cut-outs or the size and type of silencer to be employed, the makers would probably have twelve months in which to make their preparations. Mr. Ekin also visited the Triumph Cycle Co.'s works and saw and heard Triumph engines running with the exhaust cut-outs open and closed. Several machines were brought into the yard and run on the stand for the benefit of the L.G.B. inspector. On the road it was noticed that, whereas a machine fitted with an ordinary silencer could be heard approaching at quite a considerable distance and was practically quiet immediately it had passed, machines provided with a long exhaust pipe terminating at the rear of the machine were practically inaudible until they had passed the spectators, when the sound of the exhaust was very much accentuated. The visit of the L.G.B. to Coventry shows that, although the Board has the matter under careful consideration, it does not contemplate imposing harsh restrictions without making every enquiry.

When the attention of the Board is drawn to a matter of this kind, exhaustive tests have to be made before arriving at any decision, but we certainly think those who have been responsible for the agitation against the noise of motors might easily have found other forms of traffic to complain of, which not only make much more noise, but are also more dangerous.

The best machine for a sidecar.

Are you thinking of joining the ever-increasing ranks of the Sidecarists? It is a fascinating amplification of motor cycling, you know—but that all depends on the success of the machine.

You want the best, the most successful machine, of course?

The 6 h.p. N.S.U.

has proved to be the best and the most successful motor cycle for sidecar work, not only in this country but also in others.

**The 6 h.p. N.S.U. with Sidecar holds the
RECORD for NON-STOP PERFORMANCE
in the A. C. U. QUARTERLY TRIALS.**

The 6 h.p. N.S.U. for Sidecar work would, of course, be fitted with the famous N.S.U. Two-speed Gear, which has yet to meet its equal for simplicity and certainty of action and unfailing reliability.

The 6 h.p. N.S.U. is strongly built, well sprung and powerfully engined; there is not a weak part anywhere, as proved by many a rugged journey successfully completed.

The 6 h.p. N.S.U. 1912 Model is built with LOOP FRAME, rear spring and spring forks, handle-bar control, automatic carburetter, two powerful brakes, separate oil and petrol tanks, etc.

Before buying your machine, write us for full information.

OTHER MODELS: 2½ h.p. single-cyl., 3 h.p. twin-cyl., 3½ h.p. single-cyl.

Cost of Running a Motor Cycle.

Further Replies to a Reader's Query.

Sir,—I have read with much interest various opinions and experiences of the cost of running a motor cycle, and wonder if anyone can show a lower rate of expenditure than the following:

The machine, which is a 4 h.p. twin, was new in 1907, and all it has cost me for running expenses, taxes, licences, etc., totals well under £10. This has amazed many of my friends, who have at first declined to believe me, but I have soon proved to them that, with care, the sport can be made to suit any pocket which can be stretched to cover the first cost of a machine.

VIATOR.

Sir,—It may interest the writer of letter 6015 to know that my 3½ h.p. 1911 Premier has entailed no expense beyond the necessary cost of petrol and oil. I have just returned from South Wales, having ridden in very stormy weather. As regards the mechanism, the tour was without incident, the machine working with clockwork regularity. I have only been held up by one trouble, namely, a slipping rubber belt due to wet weather, and have yet to learn what a puncture is. It is true that I have only ridden the machine about 1,000 miles during the last three months, but these facts amply prove how reliable and inexpensive in upkeep is the modern motor cycle.

I. C. HARRISON.

Sir,—Mr. Walmsley's letter is absurd. To begin with he takes depreciation at ½d. per mile. Does he consider that after running a motor cycle 5,000 miles it is worth ten pounds less? Why, I bought a second-hand Triumph one year and ran it for over 4,000 miles, and finally sold it at a profit. Then he puts petrol, oil, and licences at ½d. per mile. My Triumph certainly does not cost this, and I do not pay my licences by the mile. He makes a tyre last half as long for half the distance with a sidecar. This is absolutely absurd, as a sidecar makes very little difference in the running cost. I have proved this by experience.

SINGLE CYLINDER.

Sir,—A fair number of my friends, some of whom ride 3½ singles, have often said to me, "Isn't your heavy weight (a four-cylinder F.N.) very expensive to run?" and they have been much surprised to hear that the cost amounts to very little more than one of the 3½ h.p. touring cycles. In case it may be of interest to some of your readers, I send you below what it has cost me to ride my F.N. for the last six months, inclusive of insurance and depreciation.

41 gals. petrol at 1s. ½d. ...	£2 2 9
2½ gals. oil (Price's C) at 4s. 6d. ...	0 11 3
Re-covering back tyre ...	0 15 0
Three sets of new inlet springs ...	0 1 0
Insurance ...	2 4 6
Depreciation ...	5 0 0

Total £10 14 6

I have covered a little over 3,400 miles, which brings cost out at 3.02 farthings per mile.

FOUR CYLINDER.

Sir,—There are a large number of would-be motor cyclists who are hesitating about the purchase of a machine for next year, because they lack the knowledge as to what the pastime will cost them and what return they can get for their money. The experience of riders in this connection should prove a help and, perhaps, an encouragement to such.

I have kept a careful record of expenses and mileage for the past six months, which are shown below, and I trust that you may find some use for them.

	Cost
	£ s. d. per mile.
Petrol consumed (31 gals. at 1s. 3d.) ...	1 18 9 ... 0.11
Oil ...	0 15 6 ... 0.04
Tyres and tubes ...	5 3 5 ... 0.3
Total expenses (excluding capital outlay, but including insurance) ...	15 17 7 ... 0.94

The machine giving the above results is a 1911 3½ h.p. two-speed Humber. The mileage to date is, for the six months, 4,000 miles, showing an average of 130 miles per gallon of petrol.

The Lyso belt supplied with the machine has done approximately 2,500 miles, and will do a further 500 before it gives out. A leather Service Co.'s belt has done duty in wet weather and at other times, and has 1,500 miles to its credit; and a Dunlop has accounted for the remainder of the mileage. The Service belt, by the way, was purchased in February, 1910, for use with a Douglas machine, and though it is only 3in. it has run with every satisfaction on the Humber, and has altogether run for something like 5,000 miles.

The Humber is fitted with a B. and B. carburettor, No. 32 jet, to which has been attached a 3in. copper tube, extending backwards from the extra air port, and to this may be attributed the low petrol consumption.

I am a chartered accountant by profession, and have used my machine for business and pleasure purposes, and the above figures will show that a motor cycle in the hands of one who is not an expert mechanic is not likely to prove an expensive luxury, provided reasonable care and commonsense are used in its treatment.

A.C.A.

Sir,—At the end of last year I initiated a discussion on the cost of running a motor cycle, and quite a number of your readers followed on. Most of them challenged the expenditure of 1.17d. per mile as abnormal, and tried to show that their motor cycling cost them only a fraction of this. The nonsense written in some of these letters was disappointing, but at the time I was too busy to analyse them and reply. Now, however, you reopen the matter, and in your issue of November 23rd five letters are published which give the costs as .81d., 2.38d., 1.3d., 1.25d., and 1.73d. respectively. These correspondents are nearer the mark, but, I submit, none of the results published are so fair as my own, and for these reasons, namely, my twelve months' mileage of about 10,000 with an overhaul of the machine at the end, permitted account of renewal of tyres and other parts subject to wear being included, and in the expenses were included all those items which belong to the running of a motor cycle. For example, one does not buy special overalls if one does not ride a motor cycle, nor does one buy a shed unless it is to put something in it. Therefore, the clothing is an item of motor cycling expense, and an annual charge must be allowed for the use of the shed.

To show further that my expenditure of 1.17d. per mile was an average one, I have reckoned up the cost for the second twelve months, making the same charges for depreciation, etc., and the result is practically identical. I am not going to fill your space with details; the simple fact is significant enough.

Some of the correspondents who have written on this subject have considered the cost of oil and petrol only, but these are very small items amongst the necessary expenses. Others who have only run a few thousand miles and have had no tyre renewals make no allowance for these, and publish results of wonderful running at ½d. and ¼d. per mile, but if a tyre gives out in the next ten miles after their experiences are published, and a cost of 50s. to 60s. is incurred, what is the effect on their average?

It is a mistaken policy to induce people to believe that motor cycling can be indulged in for practically nothing; it causes many to buy who cannot really afford it, and it is far better that they should know the truth beforehand. If present costs are excessive, let manufacturers set themselves to eliminate the cause. No good can come from shutting our eyes to obvious facts. At present, unfortunately, the tendency is to increase costs. Certain machines in 1912 will be £8 to £10 dearer than they were in 1909, and a further disappointing fact is the reluctance of the makers to increase their output to meet the demand. Some firms showing at Olympia had the effrontery to declare that they were full up with orders for 1912 and could not deliver. We poor riders want to know why these firms showed at Olympia at all, and why they make such a shout of 1912 improvements.

GEO. PIRIE.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Registration Numbers.

? About four years ago I registered a motor cycle in Surrey, and sold it in the same year. I have not had one since. Can I use the same numbers on a new machine I am now getting?—W.H.R.
You will have to have special permission from the authorities to use these numbers on your new machine, and will have to pay the full registration fees.

Willesden to Stamford.

? Will you be kind enough to give me the best routes from Willesden to Stamford, Lincs., what sort of roads and distances, and if possible an alternative route for the return?—W.H.W.
Your route will be as follows: Hendon, Barnet 11½, Hatfield 20½, Hitchin 34½, Biggleswade 45½, Eaton Socon 55, Norman Cross 76½, Stamford 90. Return via Stamford, Kettering, Higham Ferrers, Bedford, Luton, St. Albans, Edgware, and Willesden. The road is good beyond Barnet. The distances given are from London.

Tricar or Sidecar.

? I require either a motor bicycle and sidecar, or a tricar, second-hand, for myself and wife; also I want the cheapest as regards running. (1.) I notice second-hand tricars are very cheap and out of fashion. What is the drawback to them? Are they more expensive to run? (2.) If I can get a good second-hand accumulator bicycle, I thought of fitting a Helleken dry battery. Would this work as well as a magneto, and as cheaply in the long run? Is it a fact that one of these dry batteries will run a bicycle 1,500 miles? (3.) Could I recharge the dry battery when it became exhausted?—W.B.

(1.) The tricar is out of fashion on account of the tandem seating and inaccessibility of the back wheel, and it is difficult to produce these machines as cheaply as a motor bicycle and sidecar; also, when not sprung, they are not comfortable on bad roads. There is not much difference in the cost of running, but the sidecar will probably be the cheaper. (2.) Nothing works so well as a magneto, which causes no expense beyond the first cost. Yes, one of these batteries will last 1,500 miles, provided that the coil is an economical one. (3.) It cannot be recharged, and is, therefore, of no further use.

Knocking and Lubrication.

? Can you kindly give me some help in the following? (1.) Squeaking from somewhere, most probably from the engine. I have tried to remedy it with oil, but that has had no effect. (2.) Being a novice, I wish to ask what is the best way to detect when the engine is knocking, and also the best remedy for it? (3.) What do you advise as to lubricating the engine? When lubricating my engine I either put too much or too little, and often cause misfiring. Is it too much oil that causes the gumming of the piston, and is there any way to prevent it? (4.) Can I find a way to stop the rattling noise of the cycle? It rattles a good bit when I go uphill, and also it shakes the lamp so much that I am afraid the lamp will break off.—T.C.L.

(1.) If you can make absolutely certain that there is no bearing or working part dry, you will probably find that the trouble is due to the hiss of the air

through the release valve or carburetter air intake. This often sounds like a mechanical squeak. (2.) There is absolutely no difficulty in telling when the engine is knocking. The knocking sound is sometimes varied by a metallic clink, which is unmistakable. Slightly retarding the spark and slightly closing the air will stop it as a rule. If not, take the cylinder off and clean it and the piston head. (3.) You had better oil your engine fairly frequently, about half a pumpful every six miles. All pistons are likely to gum in cold weather, but the use of a thinner oil, and the injection of paraffin or petrol, will help to prevent it. (4.) The only way you can stop the rattling noise is to tighten up nuts that are loose. The noise may also be caused by the valve tappets, in which case the trouble is irreparable, or can only be mitigated by adjusting the tappets up to the bottom of the valve stems, if the tappets are adjustable. The minimum clearance should be about the thickness of a visiting card.

Latest model Bedelia torpedo two-seater out for a trial in the Bois de Boulogne, Paris. These light four-wheelers are increasing in popularity and attract a small crowd of interested onlookers wherever they stop.

A Motor Cycle for New Zealand.

? I should be pleased if you could inform me of the condition of roads in New Zealand for motor cycling, and whether it would be any good taking a motor cycle for use in the North end of the South Island?—C.K.W.

We should say it would be decidedly of use to you to take a motor cycle to New Zealand. The roads are not so good as those over here, but they are quite negotiable, and there are a fair number of motor cyclists in that country.

Rust and Enamel.

? I wish to ask your opinion about a paint or enamel for motor cycle frame. The enamel has chipped off in several places, and rust seems to be attacking the metal very rapidly. I have used "Velure" on a machine once before, but after a while spots of rust began to appear through it. It seems to be very hard to combat rust when once it gets started. I would be very thankful indeed for any suggestion you may have to offer.—G.D.

We do not think it is the enamel which is affecting the metal—Velure enamel is excellent—but the fact that it is chipped exposes the metal to the weather, or, most probably, the rust was there before the enamel was put on; in that case it always finds its way through. Really, the only satisfactory way to enamel the frame is to stove it properly as a manufacturer does.

A Red Hot Exhaust Valve.

? I shall be much obliged if you will kindly advise me about my motor cycle. The engine is a $3\frac{1}{2}$ h.p. 1906 or 1907 Kerry, with overhead a.o.i.v., and twice since I bought it (about a month ago) the inlet valve has blown out. The second time this occurred I looked down and saw the exhaust valve head was red hot. So far as I remember, I was going about 20 m.p.h., with the gas about one-third open and the air full on, and I fancy I switched off just previously, as I was passing some children, and opening out again may have caused an extra violent explosion. The exhaust valve opened about $\frac{3}{8}$ in., which I have since increased to $\frac{1}{2}$ in. by taking up play; it is rather pocketed. The exhaust pipe leads from the front of the cylinder to the silencer under the crank bracket. The carburettor is a 1910 B. and B. with a 32 jet. (1.) Do you think the jet is too large, or (2.) do you think it would be advisable to send the machine to a good firm of motor cycle engineers so that the parts may be thoroughly put in order? It throws oil badly, and the belt rim and back wheel want truing up. (3.) Would a shorter exhaust pipe make any difference?—C.R.

The symptoms described in your letter are usually produced by incomplete combustion; this is caused by an incorrect mixture. You might try using a slightly smaller jet, and also take care to see that your exhaust valve spring is suffi-

ciently strong. Possibly you are driving with the ignition too far retarded—that will certainly cause overheating of the exhaust pipe and valve. No, a shorter exhaust pipe would not make any difference. It would be worth while having it completely overhauled.

EXPERIENCES WANTED.

"A.C.B." (Bristol). $3\frac{1}{2}$ h.p. Lincoln Elk with sidecar.

"J.F.W." (Kingston-on-Thames). Scott two-stroke, also with sidecar.

"F.W." (Sheffield). 7 h.p. T.M.C., with and without sidecar.

"R.W.M." (Blackburn). Kempshall tyres and Dunlop belts.

"C.R.S." (New Zealand). 1911 $3\frac{1}{2}$ h.p. Brown, particularly as regards hill-climbing and sidecar work.

"A.F.S." (Bromley). Douglas, single-gear and two-speed models, with regard to hill-climbing, wear, carbonising, and valves. Also Kempshall tyres.

"G.N." (Warboys). Jones and Cowey speedometers fitted to Triumph.

"A.H." (London, W.). Two-seated Morgan runabout for touring purposes.

"R.E." (Bristol). $3\frac{1}{2}$ h.p. Humber and rigid sidecar. Safety of sidecar connections, danger from fire and collision.

"H.A." (Lincoln). $3\frac{1}{2}$ h.p. Zenith, ease of starting solo and sidecar.

Readers who wish for answers to their communications or desire readers' experiences, are reminded that a stamped and addressed envelope must be enclosed for replies.

Lake Windermere from the Bowness Road

An Anti-vibratory Hub.

The object of this invention is to provide a resilient mounting for either the front or the rear wheel, in which all possibility of shake and side play is eliminated. The hub shell A is of large diameter, and has arranged within it two spindles B C, of which B is bolted to the fixed fork D, and C similarly attached to the supplementary fork E. Balls are

interposed between the various bearing surfaces, and it will be seen that the wheel is free to play around the eccentric spindle B, mousetrap springs F providing the necessary restraining influence. Furthermore, as the connection between the fixed spindle B and the movable one C comprises a single rigid web, no independent movement can take place.—G. Douglas Leechman, No. 22,149, 1910.

A Gradually Variable Hub Gear.

Arranged within the hub A are two free-wheel clutches B, the outer rings of which are provided with spur teeth C. Engaging the teeth C are corresponding teeth D, on rocking members E, of which there are two in the construction illustrated, though more may be employed if desired. The rocking members E are

journalled in a fixed carrier F, and are oscillated therein by the action of a rotating driving cam G, acting through rollers H. The cam G is always rotated by the engine, and is moved farther or less far into operation with the rollers by means of a quick thread device J. The following is the operation of the gear: Assuming the cam G to be rotating, and completely withdrawn from engagement with the rollers H, no motion is transmitted. When, however, the cam is advanced into engagement with the rollers oscillation of

Fig. 3

Tyre Longevity.

Mr. Ernest L. Bates, of Newcastle, writes that he has used a 26x2½ in. Midland studded cover on the front wheel of his Scott for 4,049 miles, mostly with a sidecar attached. He considers it good for another 2,000 miles.

Garage for a Hundred Motor Cycles.

Mr. D. R. Clarke, New Century Garage, St. Albans, who is one of the first repairers to be appointed officially by the A.C.U. informs us that he has had a garage built to accommodate one hundred motor cycles.

The Motor Cycle in North Borneo.

Writing from North Borneo, Mr. R. K. Hardwick says that he has had his 1911 model Kerry-Abingdon in daily use, and although roads are not very much in evidence in that part of the country, and those in being are of a very rough nature, the K.A. has behaved magnificently, and given no trouble.

A Tyre Cover Lining.

To save damaged covers from being scrapped, the Acre Rubber Co., Ltd., High Street, Bloomsbury, W.C., have introduced a device known as the "Kuver-shield." It is a detachable endless lining made of the best Egyptian cloth, thoroughly impregnated with rubber, and manufactured in various lengths and widths. It is made and moulded on the same lines as a tyre cover. It is slipped inside the cover, and when the tube is blown up practically forms an integral part of the tyre.

Trade Items.

Mr. Sidney A. Horstmann, 1, St. George's Place, Bath, is now the manufacturer of the F.N. two-speed gear for the four-cylinder models.

London Matchless Agency.

Messrs. S. A. M. Witham and T. A. Carter, trading as the London Matchless Motor Cycle Agency, are shortly opening temporary premises at 184, Great Portland Street, W. Mr. Witham's name is familiar to habitués of the B.M.C.R.C. meetings, while Mr. Carter was formerly assistant manager to Messrs. Collier and Sons, Ltd. The firm will carry on business as sole agents for the well-known Matchless motor bicycles and J.A.P. engines and spares. Business will also be done in accessories, while exchanges will be effected. A private limited company is being formed to control this new business.

A Rapid Decarboniser.

Mr. Percy Butler, 3, St. Peter's Square, Manchester, has been appointed manager in the North of England for "Cylclean," the Internal Combustion Engine Cleaning Co., Ltd. Demonstrations will be

the members E takes place, the motion being transmitted in one direction through the spur teeth C and D to the free-wheel clutch members B, and thus rotating the hub shell. Variation of the amount of engagement of the cam G with the rollers H varies the degree of oscillation of the members E, and, consequently, the amount of motion of the one-way clutch, thus providing a gear which is of gradually variable ratio.—T. G. Jackson, No. 30,103, 1910.

The Enfield Spring Fork.

In the latest type of fork fitted to the Enfield machines a single spring A, secured to the upper and lower links

BC is employed instead of the duplicate springs previously fitted. This method removes the spring further from mud thrown up by the wheel.—Enfield Cycle Co., Ltd., and F. W. Smith, No. 25,522, 1910.

given in all the northern centres at an early date, and readers who are interested should send their names to Mr. Butler. "Cylclean" is a method of eliminating carbon deposit from the piston head and cylinder of an engine by oxygen. Practically any sized cylinder can be cleaned in a few minutes without disturbing it.

Catalogues Received.

The Premier Cycle Co.'s catalogue for 1912 is to hand, and is a most interesting little book. It includes full specifications of the several models of motor cycles made by the company and copious illustrations of parts and fittings. Those who "want to see the wheels go round" will find the diagrams of the engines, both single and twin, of special interest. The variable gears used by the company are also fully described.

The catalogue of Mr. Arthur R. Price, St. Paul's Square, Birmingham, contains descriptions of "Vevo" specialties, among which we may mention inflators, connections, ordinary and armoured, belt hooks, grease, and petrol injectors, tyre valves, and parts.

Winter Clothing.

Messrs. John Piggott, Ltd., 117, Cheap-side, E.C., have introduced a new winter jacket made of frieze with detachable leather lining and wind cuffs. This coat has a "multi-collar," which folds in three forms, with the lapels folded back, with the lapels buttoned over, forming a Prussian collar, and with the collar turned up and with a flap buttoned over thoroughly protecting the rider's neck.

A.S.L.

MOTOR CYCLE

Read "The Motor Cycle"
expert's opinion of the "A.S.L."
(Nov. 16/11).

"It is certainly the best sprung motor cycle we have ever ridden. We were surprised at the absence of road shocks. Although we intentionally found all the worst bumps in the road, we suffered no unpleasant jars. The action of the air springs should go far towards prolonging the life of the engine and frame fittings, etc."

Comment is superfluous.

**MADE FOR
QUALITY
REGARDLESS
OF EXPENSE
— YET THE
PRICE IS
MODERATE.**

You will often be urged to buy a motor cycle on the strength of some one claim to favour—some one point that distracts attention from faults in design or construction. Although the "Bat" has an enviable reputation as being the most comfortable motor cycle in the world, the famous Spring Frame is only one of its good and unique features. Every other feature is equally efficient, the Two-Speed Gear Box, the Expanding Clutch, the Improved Spring Forks, the Strengthened Frame, the Automatic Lubrication, the protected Magneto, the BAT-J.A.P. Engine, etc., etc.

Manufactured under the supervision of

W. RUSSELL

(Late of Price's Patent Candle Co. Ltd.),

London,

BY

RUSSELL BROS., National Oil Wks., BIRMINGHAM.

HUB LUBRICANT

TRY
A
TIN.

has been specially prepared for hubs and other ball bearings on the motor cycle. It is quite easily applied, and it stops in and keeps wet and grit out.

HUB LUBRICANT

besides being particularly suitable for hubs, is equally adapted and recommended for motor cycle two-speed gear boxes such as the Douglas and Bowden.

TRY
A
TIN.

HUB LUBRICANT

ensures cool, clean, and free running with the least amount of leakage. There is not a great deal of energy to spare even on the modern motor cycle, and inefficiently lubricated gear wheels running at high speed will absorb a serious proportion.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts, and Hants Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

IT'S MOST IMPORTANT THE MAN ABOUT TO START

Motor cycling should first visit the splendid show of machines always on view at

WAUGHOPES

Nowhere in the United Kingdom is it possible to see such a great display of the latest and best

1912 MODELS OF ALL THE MOST FAMOUS MAKES.

Send details of your used machine and receive our handsome liberal exchange offer in part payment of new 1912 model, delivered now or at opening of 1912 riding season.

9, SHOE LANE, FLEET ST.,
LONDON, E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent or forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 10, c/o 'The Motor Cycle,' Coventry"; or it "London" added to the address, then to the number given, c/o The Motor Cycle, 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons are dealt in perfect safety by availing themselves of our deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

CORONET SIDE CARS

COMPARISONS—
£5 5s. versus £8 8s.

We guarantee our £5 5s. model to be equal, and in some cases actually superior to, any £8 8s. model seen at the Olympia Show. The "Coronet" represents all that is best in sidecar construction.

MODEL C.—£7 2s. 6d.

MODEL A.—£5 5s.

MODEL E.—£7.

MODEL D.—£7 12s. 6d.

Instructive Catalogue post free, giving illustrations and full particulars of all models of Coronet Sidecars. Every model certain to satisfy and save money for buyers. Full of improvements. Quick detachable joints. Latest car pattern mudguards. Wicker, cane, or coach-built bodies. Child's reversible seat. Erectable upholstery.

NOTE front arm which grips main tube of sidecar, which is the only correct mechanical method—nothing topsided about this attachment.

Delivery from stock to suit TRIUMPHS, N.S.U.'s, REXES, P. & M.'s, BRADBURY'S, etc. Discounts to Agents.

Running Costs.

THE correspondence now appearing in our pages on the cost of running a motor cycle shows that, like all other pastimes, the expenses vary to a considerable extent according to circumstances.

We do not consider that it is possible to lay down any hard and fast rule respecting the actual cost which would apply to all cases. What is possible is to give experiences of readers regarding the minimum and maximum costs incurred with the running of a first class machine, and leave it to the rider's own individual tastes whether he includes under the head of cost of running such items as a shed for storage, special clothing, etc. We particularly mention these items, because in some instances motor cyclists have already got accommodation for a machine without requiring a special shed, and whereas one rider may consider that the pastime cannot be properly enjoyed without the latest thing in coats and overalls, with perhaps three different suits of these garments for varying climatic conditions, another will economise in this direction as well as in others, and reduce the cost considerably by making one suit of overalls suffice for all weathers. In the case of accessories, too, a motor cyclist, if he happen to be impecunious and at the same time enthusiastic, can dispense with all but the absolute essentials and curtail expense in that manner.

The question of mileage ridden also plays a big part in the annual costs, particularly in connection with depreciation. Presuming depreciation is reckoned at 20% per annum the rider who covers 10,000 miles in the period between purchase and sale will reduce his running cost very greatly in comparison with the man who only uses his mount occasionally and rides at the

most 2,000 to 3,000 miles in the same time. As an example, the depreciation for a £50 machine is £1 per thousand miles in the case of the man who rides 10,000 per annum, and £5 per thousand for the smaller mileage.

So it is throughout, one man can do for less than a penny a mile what costs another anything from double to treble that amount. We can, therefore, safely say that to the economist on a good mount it is possible to motor cycle for 3d. to 1d. per mile, provided rigid economy be exercised and a sufficient number of miles ridden.

The Sporting Side of the Pastime.

IN connection with the somewhat restrictive policy adopted by the Manufacturers' Union with regard to A.C.U. competitions, we think it is possible that the members of the Union, who appear to act very much on the lines of the Society of Motor Manufacturers and Traders, have overlooked the fact that they as motor cycle manufacturers cater for a more sporting class of purchaser than the car manufacturer. The motor cyclist is, generally speaking, younger and more keenly enthusiastic, and therefore inclined very much more favourably towards competitions of all kinds, whether they are connected with motor cycling or not. We do not think this aspect of the case has been mentioned before, and we certainly think that it is one to which the members of the Manufacturers' Union should give their best consideration. It would be extremely unwise to place too many restrictions on the sporting side of the pastime, or the interest, which at present is healthy and whole-hearted, would wane and become stagnant, the industry suffering as a consequence.

TOURING IN NORTH DEVON.

An Easy Way out of Lynmouth. "The Uxbridge Autocyclist" Clears the Air.

IN *The Motor Cycle* of November 2nd the record of the Clyno hill-climbing expedition contained the following inoffensive paragraph, which seems to be causing a good deal of misunderstanding in some quarters: "At the top of Countisbury-Hill we nearly collided with a tourist from Uxbridge with a Triumph and sidecar, who was on his wrong side, but we freely forgive him, for we all stopped and had a most interesting chat. We enquired how they got out of Lynmouth with a single gear, and learned that there was a roundabout way *via* the Doone Valley.

On the following Wednesday, "Kuklos" in *The Daily News* commented on this paragraph in the following terms, which strike me as being snappish and offensive: "These statements are as false as they can be, and I am getting tired of setting them right. A capital road leads into Lynmouth (or out of it) by gradients so easy that they present little difficulty to the bicyclist and none to the autocyclist of any power whatsoever. It leaves Lynmouth between the two horrors (Lynton and Countisbury), winds easily and beautifully up the Watersmeet Valley as far as Hillsford Bridge, where it breaks away from the Brendon and Oare Road, turns right and north [This is an error, Mr. Kuklos.—Ed.], over the 'new motor road,' and climbs with only one sharp pitch to Simonsbath, on Exmoor. There you either turn right and west for Challacombe, Blackmoorgate, and Ilfracombe or Barnstaple, or left and east for Exford, Wheddon Cross, and Exeter or Minehead or Taunton. The latter is the way to Lynmouth for all those ordinary autocyclists who are not out to ruin their tyres or twist their frames. It goes nowhere near the Doone Valley, where there is no road at all."

The Motor Cycle comment was: "Perhaps the Uxbridge motor cyclist who regularly uses this road will enlighten 'Kuklos';" and on November 29th "Kuklos" returned to the attack with the following: "I hope he will try. I shall be very pleased to make a common hash of the Uxbridge autocyclist or anyone else who challenges my Exmoor geography."

Where "Kuklos" Fails.

If "Kuklos" were right it would be bad news indeed for those motor cyclists who, besides being keen motor cyclists, are admirers of this charming corner of old England and of the "Lorna Doone" country.

For the motor cyclist to see the most-treasured spots in this delightful country a knowledge of the means of access is most essential.

The road which I referred to as skirting the Doone Valley is the key to Countisbury and the valley itself. It leaves Lynmouth by the ordinary Watersmeet Road and goes up over the new motor road, and just at the top of this latter, after rounding the hairpin bend, there is a turn to the left leading to Brendon and Oare. This road winds through the East Lyn Valley, and at Malmsmead passes right by the entrance to the Doone Valley, going on over Malmsmead Bridge to Oare Church. Here there is a right-angled turn to the left, which leads up a well-made, beautifully-graded hill to the top of Exmoor, joining the Porlock-Lynmouth road just on the Somerset side of the County Gate.

As to the astounding charge made by "Kuklos" that this information is false, I need only say that just before I met Messrs. Frank and Geoffrey Smith at Countisbury I had driven my 1911 single-gear'd Triumph and loaded sidecar right round this route, and we went to the entrance of what is known as the Doone Valley, where, according to "Kuklos," there is no road at all. Although I shed my passenger on two pitches between Lynmouth and Oare, I believe I could have managed them if I had not been caught napping. Curiously enough, one of these was the new motor road itself on "Kuklos's" route out of Lynmouth, which he says has gradients so easy as to present no difficulty to a machine of any power!

The Road over the Moors.

The road to which "Kuklos" refers, *i.e.*, the well-known one right over Exmoor to Minehead *via* Simonsbath and Exford, is another matter altogether, and is used for totally different purposes from the one to which I am referring. It gives one a magnificent route right over the heart of Exmoor, and is almost unequalled for views of the rolling moors, but when "Kuklos" goes on to write of it as "the one and only way in and out of Lynmouth for those riders who are not out to ruin their tyres or twist their frames" he is penning absolute nonsense. It certainly is very useful as a pleasant alternative route out of Lynmouth, but it is ridiculous to advise tourists to take that way into Lynmouth. The main road from Porlock to Lynmouth presents no difficulty by taking the tollgate hill at Porlock, when it is quite a simple ride on and down into Lynmouth. This bit, in fact, is one of the very gems of N. Devon, and the unfortunate tourist who, according to "Kuklos," must always go meandering all round Exford and Simonsbath would never experience the unique zigzag tollgate climb from Porlock to the top of Exmoor, which is quite an easy climb. As corner after corner is rounded (and what corners!), a magnificent panorama unfolds itself, the road being cut on the side of Exmoor.

And at the top—that unique ride on the top of the beetling cliffs, with the rolling moors on one side and the cliffs sheer down to the sea on the other, until Lynton and Lynmouth at length burst into view through a cleft in the moors. Nowhere can they be seen to such advantage as from the top of Countisbury Hill.

An easy route out of Lynmouth which joins the main Porlock Road.

Touring in North Devon.—

So much for friend "Kuklos," with his Doone Valley legend, his Simonsbath fetish, and the "common hash of the Uxbridge autocyclist" he had promised to make for himself.

I might add that I have made three week-end trips to N. Devon this year, and on each occasion I have put up at that most excellent little inn at Countisbury known as the "Blue Ball," so as to enable my being on the moors all the time

RUGGED COAST SCENERY. COUNTISBURY HILL, NORTH DEVON.

Lynmouth Harbour and old lighthouse.

while close to Lynmouth. Most reasonable charges combined with real Devon fare had made it an indispensable halting place to me, but without the tried and tested Doone Valley key route it would have been an impossible spot for my recent sidecar week-end.

I trust these few notes from personal experience may help to elucidate the N. Devon road puzzles and dispel some of the terrors existing in the imaginations of would-be North Devon tourists.—
L. W. SPENCER.

Lubrication Systems.

Some Examples of Current Practice
on Motor Cycles.

It is somewhat singular that only lately has any serious consideration been devoted by manufacturers of motor cycles to the improvement of lubricating systems, since the matter of efficient lubrication is of such paramount importance, that one would have thought it would be one of the first things to which the designer would direct attention.

The last two Olympia Shows, and especially the one just over, have, however, indicated that considerable progress is taking place. Thanks to great advance in the construction of material for the working parts of engines, the life of a motor cycle power plant is being continually extended to a greater length, but even so it is not yet what it should be. When I say "life" in this connection I do not mean the time over which the engine can operate with a tolerable amount of satisfaction, but rather the period between its being turned out from the manufactory, and the time at which it shows some appreciable falling off in power, irrespective of such adjustments to the valve gear as are rendered necessary by ordinary wear and tear. When one considers the disadvantages of the plain splash system of lubrication with which most motor cycle engines are fitted, it is almost a matter of surprise that engines do work satisfactorily for so long. This is especially the case in an air-cooled engine of high efficiency, since this implies that its operation is surrounded by almost the worst possible conditions, viz., not only poor cooling generally, but what is far worse, cooling which is not uniform around the cylinder. If the machine be single-gear, so much the worse, for in this case the load has to vary very considerably, and not infrequently it happens that over long stretches at a time the engine is called upon to give its full output against a very heavy load.

The Disadvantages of Splash Lubrication.

The principal disadvantages of the splash system, irrespective of the method of oil feed thereto are: firstly, the amount of lubrication flung on to the reciprocating parts has no proportion whatever to the load on the engine. That is to say, the piston, for instance, is much better oiled when the machine is running fairly fast on a mere whiff of gas along a level road than when the engine is slowly tugging on a severe gradient. Yet it is in the latter circumstances that the better lubrication of the piston is demanded. Secondly, the piston and cylinder walls are lubricated most upon the side which requires it least. With an engine rotating in the same direction as the back wheel of the machine, the thrust of the piston on the power-stroke is manifested on the rear side of the cylinder,

but with an air-cooled engine not only does this rear side get much hotter, but it also has considerably less oil thrown on to it than the front side, which from the very fact of its being kept much cooler and having less thrust to sustain, could do with very little. Even if the engine were reversed, and the side thrust of the piston applied to the front wall of the cylinder, only the cooling would be improved, as the bulk of oil would still be thrown on to the wrong wall. It is in this respect that splash lubrication betrays its most fundamental failing.

Lubrication of Big Ends.

The next disadvantage is that owing to the extremely high pressure upon the crank pin, it is very difficult to get the big end sufficiently lubricated, unless some method is adopted for providing it with a more or less constant feed. Unless a drilled crankshaft be employed, centrifugal force not only prevents the big end from dipping into the oil (since whatever oil there is in the crank chamber is immediately whisked to the rim of the flywheel), but causes any oil that does, by chance, get to that bearing to be thrown off as rapidly as possible. A considerable volume of oil has to be carried around by the flywheels and this absorbs an appreciable amount of power, but putting this question aside, there are other ill effects which follow upon having a crank chamber full of an oil mist, the principal one being that the under side of the piston head is kept continually smothered, and in carbonising the oil through its heat it rapidly vitiates the whole of the oil supply in the crank case. I have often seen it stated that the flooding of oil upon the under side of the piston is beneficial on account of the fact that the piston is considerably cooled thereby. But I cannot see that this argument has very much weight, since the cooling effect of the oil can at best only be very slight.

On the other hand, with a loose fitting piston a considerable quantity of oil vapour can be pumped into the combustion chamber, and being only partially carburetted, will burn only incompletely, and cause carbonisation. In twin engines of the usual V type there is, of course, the further disadvantage that the rear cylinder gets a much greater supply of oil than the front one.

The above are the principal disadvantages of the splash system, against which can only be cited a single mitigating quality, viz., that it requires no additional working parts whatsoever. To operate at all satisfactorily, however, it is essential that the supply of lubricant be as nearly as possible a constant one, and no one could fail to be struck by the indications at Olympia that so many manufacturers have realised the importance of this point

and have adopted some means or other for achieving it.

Hand Pump Lubrication.

There is still, however, a large number of machines in which the means for replenishing the supply of oil in the crank chamber consist solely of a hand pump designed to be operated every so many miles. It is, to put it plainly, difficult to conceive of any system of lubrication which could be less satisfactory than this method, for it adds disadvantages to those from which the splash system inherently suffers—that is, the supply is inconstant, and therefore periods of over-lubrication alternate with periods of under-lubrication, and the supply depends entirely upon the vigilance and care of the rider. That engines give satisfactory service under such conditions is quite surprising, and may be regarded as a direct tribute to the excellence of the workmanship and the material employed. As it is, a supply of oil is forced into the crank chamber so as to lubricate the engine entirely irrespective of the load under which it is working at the time, and also with no regard whatever as to how much oil the engine needs. In any circumstances, if this system is to average up fairly correctly, the injection of every pumpful must be followed by a period of gross over-lubrication (unless it happens to be made at the foot of a long, steep hill), and also there must be a period of gross under-lubrication immediately preceding injection. The result is a perfectly natural one, viz., rapid carbonisation and unnecessarily heavy wear on all moving parts. Furthermore, the piston is occasionally flooded, with the result that oil gets under the rings, carbonises as soon as the supply commences to get short, and the temperature begins to go up, and, as a result, prevents the rings from functioning properly.

Constant Feed.

These evils are to a certain extent mitigated by employing a constant feed, which in current practice is obtained in three principal ways. Firstly, by having a hand-operated pump which discharges through a sight-feed-drip. Secondly, by using either the compression or suction in the crank chamber to operate a visible drip feed automatically. Thirdly, by installing in the engine a direct-driven positive pump.

Apart from the fact that all these three systems suffer from the same fundamental disadvantage, viz., that they do not give a supply of lubricant which is proportional to the load upon the engine, each of them has its own disadvantages, and, of course, advantages also. The spring plunger device is simplicity itself, but depends entirely upon the care of the rider. The auto-

Lubrication Systems.—

matic crank case suction method, having very little working pressure, is easily deranged by quite a trivial amount of dirt either in the needle valve or in the pipe. It depends for its operation upon the tightness of the crank chamber bearings, and the good working of the non-return valve which has to be fixed on the crank chamber. At the same time, if it be working properly, it requires little or no attention. The third, or mechanical system, introduces a certain amount of complication, and, of course, expense, but on the other hand, it is not easily deranged, and when once set may be left to look after itself.

Advantage of Hand Pump and Sight-feed.

Regarding the question of feed in proportion to load, these three systems, as I have said, are all imperfect, but not, however, equally so. The hand-operated pump and drip gives a feed proportional only to time, and accordingly unless adjustment be made it makes no difference to the supply of lubricant whether the engine be run at full load, or at light load. In other words, whether one is rushing a heavy gradient "all out," or pottering along the level with the throttle nearly closed, the rate of feed remains the same. It is quite probable, however, that this gives actually a better effect than that obtained with the mechanical pump, or with a feed of the automatic suction type. Both of these give a supply of oil which is purely and simply proportional to the speed of the engine, which means that in running light down hill, or on the level, one is getting more oil into one's engine than one obtains when getting the last ounce of power out of the motor on a steep gradient: in other words, the engine gets the least amount of lubricant when it requires the most, and *vice versa*. Thus when the mechanical pump is merely used as an adjunct to the splash

lubrication of the ordinary kind, no advantage whatever is gained, except that the system requires no attention, and is quite positive.

As will be seen from the examples of lubrication systems which will be dealt with in a subsequent instalment, several makers improve upon the splash system by at least ensuring that oil does get to the crankshaft and crank pin bearings.

Ideal Lubrication.

Before dealing with them, however, it will be as well to give an outline of what constitutes the ideal arrangement. Firstly, there should be a positive pump driven by the engine, and furnished with an adjustable by-pass valve. This pump should supply the main bearings direct under considerable pressure, and from these the oil would pass through a hollow crankshaft to the big end bearings, thence to the gudgeon pin through a drilled connecting rod, and out through the hollow gudgeon pin on to the sides of the cylinder walls. A circular channel should be fitted below the bottom of the stroke of the piston to collect all the oil running down from the cylinder walls, and return it to the oil reservoir, from which the pump draws its supply, this oil being, of course, first passed through a filter. The base of the crank chamber should have a sump cast in it so that the internal flywheels would not pick up any used oil that fell therein from the main, or big end bearings. This oil, after being filtered, would be put into circulation again by the pump. In addition to the main bearings, the pump should force oil directly to the thrust side of the piston. These three main delivery pipes would branch from a valve which would be inter-connected with the throttle control, so that both the throttle and the valve would open proportionally and simultaneously, thus giving an oil feed proportional to the load on the engine. The oil pump would be set to deliver more oil than would ever be likely to be

required, and a by-pass, or release, would be fitted so as to return such oil as was not passed through the control valve to the supply sump.

Adjustable Trough System.

Although ideal as far as lubricating efficiency is concerned, this system is open to improvement in respect to its complication and cost of installation. On the score of economy, moreover, a less complete oiling device might be advisable, and this could very easily be devised on the same principle as is used on Daimler and Minerva cars. In this case, the lubrication is to a certain extent, on the splash method, the great point being that the amount of oil splashed on to the cylinder walls is dependent on the throttle opening, and upon nothing else. The big end bearing is furnished with a scoop which, at the bottom of its path, dips into a narrow trough which is maintained full of oil by a direct driven force pump. Excess of oil overflows out of the trough and falls into the crank chamber sump, after which it is put into circulation again. The trough is attached to a pivot at one end, by means of which it can be lifted or lowered, and thus the depth to which the big end scoop dips into the oil can be adjusted. The trough pivot is connected up to the throttle lever, so that both are operated simultaneously. The main bearings are fed by a pump in the usual way. This system, it will be seen, does not do away with all of the disadvantages of splash lubrication, though it gets rid, at any rate, of some of them. At the same time, although the oil delivered to the piston and cylinder walls is proportional to the output of the engine, the feed is not so effective as it would be if the oil were delivered to the thrust side of the piston direct.

Next week's instalment will contain illustrations and descriptions of lubrication systems on existing motor cycles.

AN AUTOMATIC BACK-REST.

An improved back-rest, which is automatic in its action, has been produced by T Eltringham Henderson, of 73, Camden Street, North Shields. The action is simple, and can easily be followed by reference to the appended sketch. It will be seen that the rider's weight forces

correct position, in which it is maintained by the pawl K which drops into the clip J. The height of this clip is adjustable to suit the weights of various riders. When the rider rises from the saddle the saddle springs expand, and thus lift the pawl K out of the clip J, whereupon the back-rest, which is hinged at L, drops

back on its cradle spring N. This allows the rider to dismount in the usual manner without being impeded by the fitting. The position of the rest is adjustable, as also is the leverage on C. The device is extremely neat and ingenious, and should admirably suit the needs of those requiring an automatic back-seat.

down the lever C through the medium of the connecting link B. C, in its turn, is connected by means of the links B' to the bottom of the hinged back-rest pillar D. Thus, when the rider takes his seat the back-rest rises automatically into the

The coach-built sidecar body illustrated is one which requires no door fastenings, as the peg marked A fits into a corresponding hole B, the combination, therefore, being self-fastening. It is the production of Farrar's Motor Exchange, Halifax.

OCCASIONAL COMMENTS

By "IXION"

The Tyre World.

Standard tyres at present fall into two clearly divided classes. On the one hand the most popular tyre lines consist of comparatively light and inexpensive covers, which no experienced competition rider would dream of fitting for a 1,000 mile event, unless factory pressure compelled him to use them. The anti-skidding corrugations on their treads are worn flat in about 500 miles or so on the back wheel, and punctures are of frequent occurrence. Also it is not unknown for the tread to split, the wall to break, or a big nail practically to ruin the cover so far as road-side repairs are concerned.

After about 1,500 miles on the back wheel such a cover is usually untrustworthy, and a cause of chronic nervousness until its ultimate demise. That such covers should be standard in makers' catalogues is beyond my comprehension, unless it be due to the price question.

On the other hand, many tyre firms manufacture and list a far heavier type of cover at a considerable increase of cost. The corrugations of its tread are so pronounced that it may still serve as an efficient anti-skid after 2,000 miles hard work on the rear wheel; a few chosen samples are genuine non-skidders after double this distance under favourable conditions. The tread is so thick that only a very big nail can effect a puncture, and even then has to enter at right angles to penetrate the air tube.

The tread is solid enough to wear until the fabric casing disintegrates in 4,000 or 5,000 miles, and the walls are sufficiently sturdy to last a year without collapsing. From the user's standpoint such tyres are a genuine economy, not only of time and temper, but also of money. It is only their high prime cost which prevents them from being listed as standards in the average motor cycle catalogue. But their existence is only recognised by a minority of motor cyclists.

I suppose managers of firms which have to produce machines at a price are compelled to buy cheap light tyres; if they ride themselves, they use the firm's standard cover, and never realise its defects, because the running shop staff usually do their repairs and fit new covers for them, and the cost goes down in establishment charges.

The testers, of course, have to use the tyres supplied by the firm, and seldom use the same machine long enough to realise how quickly the treads wear off and how easily they puncture. There may be a small explosion after the annual six days' trial, when the team of three representatives return and explain that they have had endless tyre troubles. But the matter is often forgotten by the next year.

I should like to see the big tyre firms pressing the advantages of these heavier and more costly tyres up in

their trade customers; I should like to see every motor cycle makers' catalogue listing heavier tyres as an extra, and advising customers to submit to the extra outlay in the interests of real convenience and comfort, and of final economy.

Positive Transmission for Lightweights.

I should like to commend the idea of rigid and positive transmissions to those who are interested in the 80 lb. lightweight. In the last T.T. Race I took a special interest in the drive applied to the Alcyon; a small pinion on the crankshaft meshed with a large gear wheel on the counter-shaft; this gearing effected all the necessary reduction, and the final drive was by chain running over two sprockets of equal size. A change of ratio could be effected by carrying an extra sprocket on the far side of the rear wheel, and reversing the wheel when required.

Mr. G. N. Higgs's stand at Olympia contained a most admirable lightweight Alcyon, which may prove to be a prophet. Its drive was exactly as described above, and the possible harshness of this drive was modified by the use of a miniature twin-cylinder engine, of the side by side vertical type, with all valves mechanically operated, and the exhaust valves in front. I dare say this machine scaled considerably over 80 lbs., but an 80 lb. type of similar pattern is well within the bounds of possibility.

Given a reliable engine, it should turn out an entirely satisfactory machine with good hill-climbing possibilities and little liability of trouble. Does it represent the lines which the lightweight will follow in its inevitable evolution?

THE MOTOR CYCLE IN INDIA.

A rider of a T.M.C. travelling at 35 m.p.h. along an exceptionally good Poona road.

The Motor Cycle for Postal Delivery.

An up-to-date Scheme which may revolutionise Rural Postal Services.

It has always been a matter of surprise to us that tricar, sidecar, and, in fact, any speedy light type of passenger motor cycle, have not been utilised long ago for rural district postal work. A light motor vehicle is not only cheaper, but, what is more important in the distribution and collection of mails, much quicker than a horse. It is perhaps only natural that the lead in pressing the motor cycle into the service of H.M. Government should be given by the centre of the motor industry.

Quite recently the Coventry postal authorities resolved to displace a horse and cart used on an exceptionally severe rural service, covering a distance of forty miles, by a motor bicycle and sidecar, the sidecar seat of course being displaced by a large hamper to accommodate letters and parcels. The machine selected for the work is a $3\frac{1}{2}$ h.p. Rover with three-speed gear, attached to which is a Mills-Fulford sidecar, and mounted on this is a hamper measuring 30in. x 30in. x 28in. Although the adoption of the motor cycle is at present more in the nature of an experiment, it is an official move, and one which, should it prove successful, will have a far-reaching effect, and will revolutionise the postal delivery service throughout the whole country. Up to the present the machine has behaved magnificently. The driver is not experienced, but his runs commence at six o'clock each morning, when he delivers letters to the sub-offices of Radford, Keresley, Corley, Fillongley, and Arley, collecting on his return run. This journey is repeated

in the afternoon at four o'clock, the motor cyclist postman finally arriving home at 7.45 p.m., which at this time of the year means from three to four hours of riding in darkness.

The Saving of Time.

On the very first day's test it was found that the service was accelerated by no less than four hours, i.e., one hour was saved on each journey, outward and homeward. When it is considered that this sidecar is doing the work which was previously performed by a man with a horse and cart for the heavy work of the main journey and a cyclist for the quick day mail, it will readily be realised that this up-to-date scheme has every promise of success. The most severe time of the year has been selected for the trial, which is to extend over a period of three months, and should the Rover sidecar emerge successfully—and we do not doubt its ability to do so—motor cycles and sidecars, painted a vivid red and carrying the Royal mails, will be a common sight on our roads.

In conclusion, we should like to acknowledge our indebtedness to the Coventry Postmaster, Mr. F. Taylor, who courteously provided us with the above information. Mr. Taylor is as anxious as the keenest motor cyclist would be to expedite the delivery and collection of mails, and has great faith in the motor cycle being adapted

to the requirements of the rural postman. He listened with interest when we told him of the good and regular work which is being performed by motor cyclist postmen in the United States over very scattered areas.

earth the better. The roads are not made for either motor cycles or motor traffic. They are made for ordinary people." Whatever his Lordship's private opinions may be, we certainly think he should not allow prejudice to overcome discretion, and make statements of this nature from the Bench.

The postal delivery sidecar with which the Coventry Post Office authorities are at present making some im-

portant trials. The machine, which is a $3\frac{1}{2}$ h.p. Rover, has performed its work excellently.

His Honour Deputy-judge Templar made some remarkable statements with regard to motors at the Tadcaster County Court last week. According to the *Yorkshire Evening Post*, he is said to have stated that "Motors are the greatest nuisance which ever came, and the sooner they are swept off the face of the

The Running of the Water-cooled Rex.

ANYONE who has studied closely the shortcomings of the modern air-cooled motor cycle engine is forced to the conclusion that water-cooling possesses great attractions. What present-day motor cyclist has not been heard to grumble that his engine knocked, his engine accumulated carbon deposits in a comparatively short distance, and that when asked to do really heavy work it knocked itself to a standstill on a steep hill through overheating? And, further, that he dare not venture forth for long distances without a spare valve or valves in his tool kit. All these drawbacks promised to disappear with the adoption of water-cooling, so it was with much interest that we recently accepted an invitation by the Rex Motor Manufacturing Co., Ltd., to try their water-cooled model.

Rex water-cooled $3\frac{1}{2}$ h.p. power plant, showing position and neat design of the honeycomb radiator.

The machine we sampled was the $3\frac{1}{2}$ T.T. mount ridden by R. Lord in the Isle of Man. Its engine dimensions are 85×88 mm., capacity 499 c.c., but the 1912 design has been increased to 84.5×95 mm., capacity 532 c.c., and is rated at 4 h.p. The general design, however, remains the same. The radiator, which is of the honeycomb pattern, is in two halves, one fitted on each side of the down tube, pannier fashion, the bottom of the radiator coming below and the top above the cylinder jacket, thus enabling

thermo-syphon cooling. Once full of water, the tank seldom requires replenishing.

The makers' confidence in the machine is demonstrated by the fact that not a tool or spare of any description was put on it; and so with merely a King Dick in our pocket the machine underwent a trial on three successive week-ends.

On the road the machine runs very smoothly, and is free from all rattle in the radiator, and there is no splashing of water, as might be supposed. We were especially pleased with the manner in which it took a high gear without any fuss, which enabled one to maintain a steady 30 m.p.h. with the engine turning over at a comfortable speed. The water-cooled Rex is by no means lacking in pace, and its hill-climbing capabilities are proved by the fact that the machine took on the run Saintbury Hill, near Broadway, at a fine turn of speed, geared $4\frac{1}{8}$ to 1. Saintbury averages 1 in 11.9 for over a mile, the steepest gradient being 1 in 6.1. When running slowly in traffic, engine knocking was not entirely absent, but we partly blamed the spark timing for this.

Praise for the Long Exhaust Pipe.

The long exhaust pipe, extending beyond the rear hub, as adopted on the 1912 Rex, is an effective silencing arrangement, and most pleasing to the rider, who can hardly hear the beat of the engine as he whizzes along, but one hardly wants a cut-out in addition, for there does not appear to be the slightest back pressure.

There is no need for us to enlarge further upon the genuine comfort afforded by the spring seat-pillar, for it is such a well-tried device. In addition to the smooth pull and soft explosions, a big point in favour of the water-cooled Rex is that the engine never requires an injection; even on the coldest mornings the engine is as free as ever. Another advantage which the makers have proved after extended trials is its economy in petrol and lubricating oil. Altogether, we were much impressed by this water-cooled mount, and can imagine no more suitable single-cylinder sidecar machine where it is frequently necessary to resort to the low gear.

CLUB REPRESENTATION ON THE A.C.U.

With the object of meeting with the views of affiliated clubs, especially those at a distance from the Metropolis, the following resolution has been passed: "That this committee recommends to the General Council of the Auto Cycle Union that increased representation be given to the affiliated clubs, and that a special sub-committee be formed to carry out a new centre scheme. This sub-committee consists of Messrs. Otto Thomas, A. J. Moorhouse, W. Pratt, F. A. Hardy, and J. W. G. Brooker."

It is good to know what you buy before buying ;
 It is better to know that what you buy has been bought
 by others ;
 It is best to know what the other fellows say about what
 they have bought and what you should buy.

If you are casting
 about for a motor-
 cycle belt, select a

DUNLOP

which is working its way to the position of first favourite by reason of its flexibility and reliableness.

The subjoined letters, written by motor cyclists for the guidance of their fellows, explain its popularity and adduce sound reasons for purchasing it:—

From Dublin.—“No sign of stretching.”

“It affords me great pleasure to testify to the admirable quality of your 1" belt. Before I purchased it I had no end of trouble with other makes, but since I fitted the Dunlop to my 1911 Rex I have covered 1,000 miles, and it has shown no signs of stretching. Wishing you every success,
 J. J. S. ALLEN.”

11, Camden Street Upper,
 Dublin, 19/10/11.

From Bournemouth.—“Dunlops make a difference.”

“A short time ago I noticed in one of the papers a letter from a gentleman who was much satisfied because he had done about 800 miles on a Dunlop belt. I should like to

confirm all your correspondent said with regard to the qualities of your belts. Since May last, one has run my machine (a 3½ h.p. Triumph with N.S.U. two-speed gear) no less than 1,469 miles, of which 1,459 miles have been with a sidecar attached. The belt is by no means finished yet, and is good for another 500 miles at least. I have had to shorten it only four times, and the way it runs for hundreds of miles with no signs of stretching is extraordinary. Surely these figures must be a record for a rubber belt? Previous to using the Dunlop I had very disappointing results with several other makes, and had become very sick of having to buy new belts after every 100/60 miles. I think it should be made widely known amongst motor cyclists what your belts are capable of.

5, Avon Road, Bournemouth.
 16/11/11.

J. GUY.”

W. N., Ross-on-Wye, writes—

“The machine continues to give great satisfaction. I have done up to the present about 3,000 miles (a good deal of it with sidecar and passenger), but have never yet unpacked the toolroll on the road or made any adjustment other than the pulley or belt.

I shall be pleased to give my experience to any enquirer. The machine I use in all weathers in my business and find she is very safe on grease, in fact I have never yet had a side-slip or let her over.

She runs smoothly and silently, and has never required any adjustment during the 6-7 months I have used her.”

Catalogues and full particulars free on application.

THE ROVER CO., LTD.,

"The Motor Cycle" as a Tyre Gaiter.

[6127].—Whilst out on my two-speed Number late the other night just midway between Maidstone and Wrotham I got a bad burst and had no tyre gaiter with me. I had a copy of *The Motor Cycle* in my pocket, which I cut in half, folded it crescent shape, placed it inside the cover, and fitted my spare butt-ender, and managed to reach home on that. I can assure you I blessed that copy, and reckon it was well worth the penny spent on it.

A. E. LICENCE.

Touring in South-west Wales.

[6128].—Referring to letter No. 6091, signed "BD 50," relating his hair-raising trip over the Llanybyther-Llansawel Road, he is not the first to ride that way by many a long day. On one of my many trips from South to West Wales I was over the roads he mentions six years ago on a 4 h.p. Stevens before the days of two-speed gears, and, having spent some years in Wales, think it very little out of the ordinary.

L. EVANS.

Winter Mudguarding.

[6129].—Referring to your issue of the 7th inst. and to the article entitled "Mudguarding" on pages 1338-1339, we would like to call your attention to the fact that, so far as front mudguards are concerned, our Mon-Aero-Guard, as illustrated in the same issue (page 1348), embodies all the suggestions made by your contributor. The front extension is brought over as far as is safe, while the brake work and springs are completely shielded from all mud and water. Moreover, it is absolutely unnecessary to affix a magneto cover when this guard is used, as no mud whatever can fly on to the magneto from the front wheel.

The guard is not new; it has, in fact, been made privately in Coventry for some years, but we shall shortly be able to supply it in quantities.

THE AUTO-AERO CO.

Air v. Water Cooling.

[6130].—As a staunch believer in the future of water cooling for motor cycle engines, I note with interest that the Rex Co. are putting a water-cooled model on the market. To my mind this is the beginning of the end for air-cooled engines, and in a few years they will be obsolete.

In my opinion, the growing popularity of variable speed gears will compel designers seriously to consider the claims of water-cooling, even if only on account of the abnormal wear of the engine a speed gear naturally causes, on account of the higher number of revolutions and increased working temperature on the low gear.

It is well known that the modern high-compression engine is short-lived to a degree that few car owners would tolerate. No doubt a larger number of owners of sidecar outfits will heartily agree with this.

I can hear somebody enquire as to what the advantages of the water-cooled engine are. In the first place, (1) greatly decreased petrol and oil consumption, (2) longer life of engine, (3) superior power maintenance, (4) absence of valve troubles, and lastly (5) increased power when plunging hard at full throttle, i.e., absence of overheating—a very real trouble, as can be seen by the fact of the crack riders in some of the trials stopping at the foot of hills to cool engines!

These are very material advantages indeed, and the only disadvantage that I can see is slightly increased weight, which, in view of the benefits obtained, is not worth consideration.

J. A. WOOD.

Belts and Bad Weather.

[6131].—With regard to letter 6087, I have ridden a Service belt 7,200 miles and the belt is still good. The only attention I give it is an occasional scrape and a rub over with engine oil; it has not let me down yet and always grips. I use the machine every day, and ride in every county south of Yorks. Need I add the usual disclaimer?

A. E. LICENCE.

[6132].—Until we read Mr. Choldcroft's letter [No. 6087] of November 30th we were not aware of the circumstances to which he refers. He should have taken the trouble to have ascertained definitely whether or not Mr. Barnes was using our belt, and also whether there was any special reason for its slipping. We all know Mr. Barnes to be an experienced competition rider—no one more so—and the mere fact of his selecting our belt in preference to others is very gratifying to us and an excellent testimonial for the belt itself.

The offer made in our previous letter referred to is still open to Mr. Choldcroft or any other reader of your paper who likes to avail himself of it.

THE SERVICE CO. (LONDON), LTD.

Adjustable Tappet Rods.

[6133].—In case anyone is tempted to try the type of adjustable tappets illustrated in your last number, letter 6107, I may say that this idea does not work in practice.

In the first place, no provision is made for holding the tappet stem itself whilst unscrewing the lock nut, etc. We tried this idea when experimenting with the 1912 3½ h.p. New Hudson engine, but found it quite useless, and we finally adopted the pattern now fitted.

Incidentally, any noise from the valve gear can be far more effectively eliminated by the means of adjusting the tappets close up to the valves than by any arrangements of springs which I have tried so far.

Spring tappets do not seem to work at all at very high speeds, unless the springs are very strong.

ROY W. WALKER.

Second-hand Machines and Agency Conditions.

[6134].—May I draw the attention of your readers to conditions which are likely to be fraught with serious consequences to would-be purchasers. I have been riding a particular make of machine for three years, having had two models. Wishing to buy next year's model I went to various agents in my neighbourhood to discover which would allow me the most on my old machine. Eventually I found a dealer, in whose selling district I did not reside, who offered me the best price, and so I placed my order with him.

Now, however, he informs me he is not permitted to sell to anyone residing out of his district without sharing his commission with another agent.

On the face of it this restriction does little if any harm to the agent, but to the intending purchaser it is a serious matter. The effect of it is practically to dictate from whom he is to buy his machine, and to prevent him obtaining a fair allowance for his old model, as obviously no dealer can compete with the dealer in the would-be purchaser's own district in this respect.

Personally, I have never dealt with the agent in my district, as I have always obtained what I consider better treatment from an agent in an adjoining district, and the only effect that this move is likely to have upon me will be that I shall purchase another make of machine, and friends are talking of following my example.

LIBERTAS.

The Evolution of Transmission.

[6135].—I read the article on "The Evolution of Transmission" in the issue of November 30th with much interest. What I cannot understand in this article is why a person of "Ixion's" wide experience, having given up the belt, should now plump for what is no doubt a go-between, viz., the chain drive.

There seems to be no doubt that the motor cycle is going through the same series of evolution with regard to transmission that the motor car has already gone through, and the chain has practically disappeared from all recent car practice in favour of shaft drive with either worm or bevel. The shaft drive has also already been used with excellent results on one or two makes of motor cycle for a fair number of years.

The disadvantages of chain compared with shaft drive, even when the former is completely enclosed, are, in my opinion, considerable, such as stretching, with the consequent getting out of pitch and breaking of rollers, and with the usual open running chain must be added fairly rapid wear, dirt, and expenditure in grease or oil.

The chain, both open and enclosed, has undoubted advantages over the belt, but in my opinion cannot be compared as an all weather transmission with the completely enclosed shaft drive, as regards lasting, general efficiency, and cost of upkeep.

I may say that I have had two years' experience of a shaft-driven machine, and the transmission has not cost a farthing or needed any adjustment whatever. It looks as if it should last as long as any other working part of the machine, and is quite unaffected by any condition of weather or roads.

F. T. MARLEY.

[6136].—How glad I am to see that that most respected and popular motor cycle writer and critic "Ixion," who is so jealous as to his identity, has something to say against what is, perhaps, our greatest bugbear—belt drive.

I feel charmed with his ideal of chains running in oil. Who will try to criticise it, save those enthusiasts who ride excellent variably geared machines, the gear of which is inseparable from belt transmission?

I have been riding a 1910 Triumph all the season. The machine I must say has been a gem for reliability, but oh! those belts. They have been my only source of roadside trouble, and have cost me £4 this season. Not because my pulleys have been out of order or not in line, for I have got from 1,900 to 2,400 miles out of each belt.

The other day I chanced to be near a "meet" of foxhounds, and I met two ladies on restive horses on a steep and twisty hill. The road surface was very wet and muddy. I slowed down in passing the ladies and when past I opened the throttle, the engine roared round, and the machine came to a standstill on the steepest part of the hill—due, of course, to the wet and slipping belt.

As it is a question of £ s. d. and all-weather riding with me, I feel I shall be justified in parting company with belt drive. I should like to see a silent chain drive (as used on the timing gears of the best car engines this year) enclosed in an aluminium, quickly detachable case (similar to the Triumph magneto chain cover) and running in oil. An aluminium case seems to me preferable to a steel one; it would look very neat, and there would be no enamel to clip off when it was detached.

E. W. CHOLDCROFT.

[6137].—Having read with interest the paragraph in "Ixion's" comments on "The Evolution of Transmission," I wondered, as I have often wondered before, why it is that the claims of the shaft drive seem to have been either forgotten or ignored.

After weeks spent in a most careful inspection of all makes, I finally decided on a 2½ h.p. F.N. lightweight.

Why? Because—principally—of its system of transmission. Taking the question of belt drive first, one can read scarcely a single account of a tour or trial in which the defects of this transmission are not shown up.

As to the chain drive, although this is a far better mode of transmission than the belt, I doubt if it can be said that there is a machine on the market which has its chain sufficiently protected and lubricated.

Now I maintain that with a properly constructed shaft drive all the above defects of transmission by belt or chain are avoided.

The champions of the belt drive assert that for sweetness of running this method of transmission is unbeatable; all I can say is that with my shaft drive I have never experienced a suspicion of jar or vibration at whatever speed the engine is running—and I can ride from four to thirty-five miles an hour—the only indication one has that the shaft is doing its work well and truly being the gentle "hum," which rises and falls in a pleasing cadence as the speed of the machine is increased or lessened.

Why do our firms cling so tenaciously year after year to the belt drive?

It is, I am afraid, the old reason, too strong a conservatism in idea and design.

CLERICUS.

[6138].—"Ixion" is too hard on the belt! He refers to the constant adjustment of belts at the foot of every steep hill in the various long distance trials. Why? Because by means of the belt and adjustable pulley a handy means is provided of altering the gear ratio. Why does not the chain driver do the same? Simply because his gear is fixed. He is unable to alter the ratios unless he carries spare chains and sprockets. I should like to have explained why one occasionally sees chain driven machines with the wheels out of line? I put it down to the rigid drive. The last time I used a chain drive, loose and broken spokes in the back wheel were not unknown. Has this difficulty been overcome? Again, "Ixion" must not forget that one can change a rubber belt with the aid of detachable fasteners and have clean hands at the finish. Contrast this with the repair of a chain. Again, what would happen if an engine seized with chain drive? I had this experience last year with a belt drive, and although the belt was adjusted fairly tightly it merely slipped over the pulley. With a chain I presume I should have slipped over the handle-bars! Whilst I must admit I am sick and tired of fiddling with belts, I am not nearly so convinced after ten years' riding as "Ixion" is, that chain is the transmission of the future.

CRITICUS THE SECOND.

Multi-pole Sparking Plugs.

[6139].—I should like to make a suggestion in connection with the multi-pole sparking plug invented by Mr. Howard Smith, and which appeared in your issue of September 14th.

This issue has only just reached me, October 30.

Would it not be possible, instead of using the device as a multi-spark plug, to make use of it to obtain two simultaneous sparking positions some distance apart in the cylinder, as shown in the top sketch. Of course, the objection to a plug of the above type would be the introduction of two high tension conductors so close together; but the chances of shorting could be materially reduced by making the upper part of the plug of a larger diameter than that used in general practice. The plug B could be of standard type, and the connection between A and B could either be by ordinary high tension wire or by a stiff piece of metal, which latter would, I think, be preferable, as it would avoid having loose wire flapping about. Of course, in the days of the accumulator and coil it was a comparatively easy matter to have a four-terminal coil, and thus obtain the two sparking points, as in the lower sketch, but with a magneto it would, I think, entail having an extra slip-ring. I do not in any way wish to encroach on Mr. Smith's invention, but I simply put this suggestion forward on the chance that it may be of some general interest.

E. P. THOMAS.

Suggested method of wiring mentioned in letter from E. P. Thomas, Hong-Kong.

- A. Special double pole plug.
- B. Ordinary plug.
- C. Primary winding for coil system.
- D. Secondary winding for coil system.

Hong-Kong.

[Since the date referred to by our correspondent, the Bosch Co. have introduced a special magneto which gives two sparks simultaneously at two different plugs in a single-cylinder engine. See page 1154 issue of Nov. 2nd.—Ed.]

Ladies' Motor Cycles.

[6140].—In the article "Ladies Motor Cycles at Olympia," by Mrs. Cooke, published in your issue of Nov. 30th, this lady states that many makers have completely covered in all the mechanical parts to guard against spoiling one's clothes, and that some work is involved in moving the shields should anything go wrong. She also states that "she prefers to see some of the mechanism of the machine she rides," but I find that the Motosacoche appeals to those riders who do not know anything about engines, and moreover do not wish to. It is only the work of a minute or two to dust over the shields, which are detachable in two or three seconds.

Mrs. Cooke also objects to corded dressguards, but they are quite satisfactory on pedal cycles, and if in their stead were fitted steel guards covering in the wheel completely, what an unsightly contraption it would be. Mrs. Cooke also seems to overlook the fact of the cooling effect the shields have on the engine. It is unnecessary for a lady who rides one of these machines to wear the usual mackintosh overall with a strap round her waist; she has only to wear her ordinary walking costume. OSBORNE L. DE LISSA.

Wear of Big End Bearings.

[6141].—With regard to the above, your readers, and also the manufacturers of motor cycles, must consider the fact that they are getting double, and sometimes three times, the power from their engines that they obtained two or three years ago. Bigger bearings and forced lubrication are the remedy. The method of crank construction on the twin cylinder horizontally opposed Douglas lends itself beautifully to this principle, and the timing gears might also act as a pump. With regard to rear springing (in my humble opinion) to leave the engine and other mechanism unsprung is a big mistake, as the heavier the weight the steadier the riding (in proof try a big landaulet).

Sketches referred to in letter from R. Halbard.

A. Engine. B. Hinged fork end. C. Hinged bracket joint.

The transmission should, however, be through equal sprockets, all gear reduction being effected through a rigid drive. My idea is that sketch No. 1 is wrong, because as the frame works up and down over inequalities of the road an unequal amount of belt is unwound off the two wheels, causing a jerk. If the flywheels are heavy, this must cause tyre wear, not to mention belts, whereas, in No. 2, the sprockets are equal, and you can have as much movement as you like; it will not affect the engine or tyres. I hope I have made myself clear. I think this is the reason for the scarcity of the spring frame pedal cycle. R. HALBARD.

Proposed Abolition of the Cut-out.

[6142].—In your leader *re* cut-outs and noise you just hit the nail on the head. Yes, it is the unreasoning prejudice of the public that is the cause of more than half the trouble—a prejudice directed against motors in general and motor cycles in particular. When horse-drawn lorries are being driven over stone sets on the trot, as they often are when lightly loaded, the noise, as we all know, is absolutely deafening, and yet our fair-minded public never says a word. A fortnight ago I was conversing with a friend in a busy town where stone sets abound. Two lorries came past, one behind the other, at a brisk trot, when we had to suspend our conversation for about half a minute. I remarked to my friend that if a motor cycle made half or a quarter the noise, the public would be up in arms. And yet the horse-lorry runs absolutely free from taxation, whilst the motor cyclist pays tax in four different ways, viz., licence, petrol duty, registration, and driving licence. I consider this prejudice adds insult to injury. As you truly say, when the motor cycle becomes practically noiseless, it will be thought dangerous on that account. FAIR PLAY.

[6143].—I have read with interest the letters appearing in your popular paper regarding the abolition of the cut-out, and would like to give my humble opinion of the matter. I think the idea of abolishing the cut-out is ridiculous. Had it been of no benefit to an engine, would it have been adopted practically universally by the manufacturers? As regards the noise made through the opening thereof, it is absolutely nothing in comparison to that of a steam roller at work or a steam tractor with a truck or so behind it; in fact, there are any number of vehicles which are continually running about towns which make quite as much noise as a motor cycle with its cut-out open—if not more. I ride a fast T.T. machine myself, but although I keep the cut-out closed in town, do not see why I or anyone else should be compelled to do away with it because it makes a noise! I know it would be detrimental to my machine, inasmuch as on a day's run it would most certainly (in my case, at least) be the cause of one or two stops on account of overheating, no matter how carefully the machine were driven. Besides, what harm does it do anybody if the rider of a machine uses his cut-out on the open road? I firmly believe that if half the people who talk about the abolition of the cut-out only had the experience of riding through a crowd on a fairly silent machine with its cut-out closed, they would come to the same conclusion as I have, and that is that a silent machine is a danger to both its rider and the public generally.

W. EGBERT JAMES.

Motor Cycle Clothing.

[6144].—We frequently notice in your "Questions and Replies," hints to motor cyclists about clothing. For instance, on page 1335 you say, in reply to "O.V.T.": "Nothing is absolutely waterproof except paramatta (when it is new) and oilskin (always). Now paramatta is simply the name of a fabric which in itself is about as waterproof as a pocket handkerchief. Paramatta is only waterproof when it has been coated with rubber—technically called "proofed." As regards oilskins always being waterproof, one of our staff who has tried them informs us that they are waterproof until they have been chafed, and then they require re-oiling.

Without wishing to get a free advertisement, any medium quality rubber-proofed material, such as we or any other first-class manufacturers produce, will keep out a pouring rain for days, and will be as waterproof at the end of six months as the day it was bought, provided it has had moderate care—say not had any holes punched through it, or soaked in petrol or lubricating oil.

As regards Irish frieze leather-lined, the disadvantage of these thick materials is that they are very heavy when wet, and take a long time to dry.

If the rider does not object to rubber-proofed garments they are undoubtedly the cheapest and best. One rubber-proofed suit would outlast a dozen oilskins, and would preserve the wearer from the old "sea dog" appearance inseparable from the latter.

For those riders who have an objection to rubber-proofed garments we supply our special "Everdri" cloth. This will keep out the rain for a considerable length of time. It contains no rubber, and is therefore quite porous.

We might mention that several members of our staff are motor cyclists, and our motor cycle clothing is actually made by motor cyclists for motor cyclists.

We have tested the waterproof qualities of our motor cycle jackets by playing a hose on them at full pressure for an hour or two, to make certain that the rain could not force its way through the fastenings of the coat.

DUNLOP RUBBER CO., LTD.

[We regret the omission of the word "waterproofed" before the word paramatta. We cannot absolutely endorse the statement made in the second paragraph of our correspondent's interesting letter, viz., "that any medium quality rubber proofed material will keep out pouring rain for days." Our experience is, and we think most motor cyclists have found out, that while rubber proofed material will stand a great deal of rain, at the end of a long run in pouring wet the material becomes soddened, especially after the clothing has been used for a time. If this is not the case, why do trials competitors invariably don oilskins if they think they are in for a soaking day's ride? On the point of appearance the waterproofed garments are, of course, unquestionably superior.—Ed.]

Lining on Tanks.

[6145].—"R.J.D." asks, in the November 30th issue, for a tip regarding lining of a tank. Why not let him try the old plan of pasting papers on the tank in the form of stencils, leaving between their straight edges the space for the paint line. They are afterwards wetted and washed, leaving the line on the tank. J.M.C.

Sunrising Hill and 3½ h.p. Sidecars.

[6146].—I noticed a statement in *The Motor Cycle* recently to the effect that H. G. Dixon, driving a three-speed motor cycle and sidecar, is the first to climb Sunrising Hill with a sidecar in competition unaided. Will Mr. Dixon tell me when he did it, as a friend of mine happened to be at the Birmingham and Sutton Coldfield A.C. Trial referred to, and he assures me that at the first attempt he certainly did not get up the hill even after jumping off and running alongside his machine for some distance? Perhaps Mr. Dixon climbed the hill in the dark. OBSERVANT.

Petrol Charges in Oxford.

[6147].—As a regular reader of *The Motor Cycle*, may I appeal, through its columns, to Oxford motor cyclists on an important matter. The price of petrol, always high in Oxford, has recently reached a figure which, with the possible exception of the time of the strikes, is, I think, unprecedented. Shell has often been sold here at as high a price as 1s. 4d. per gallon, but during the last six weeks the price has risen to 1s. 6d. per gallon. Great indignation is felt at such a state of affairs among the motor cycling friends with whom I have discussed the question. But I should be glad if motor cyclists in general would tell me through your columns whether such a condition exists elsewhere. OXONIENSIS.

Silence and Silencers.

[6148].—As numerous complaints have recently been made with regard to the inconsiderate and noisy manner in which some motor cycles are being ridden in and around Birmingham, we should appreciate your assistance in pointing out the harm done to the pastime generally by such practices, in the hope that an improvement may be brought about.

Up to the present the complaints we have received have been made by motorists, but if an improvement does not take place we cannot be surprised if the public and the authorities also complain and apply for further restrictions, which we should all deplore.

EDWARD H. FRYER, Midland Manager A.A. and M.U.

HOWARD SMITH, Hon. Sec. Sutton Coldfield A.C.
R. V. C. BROOK, Hon. Sec. Birmingham M.C.C.

Competitions in 1912.

[6149].—Comment has been made in your columns on the Herts County fixture list for the coming year.

May I point out that this club has no wish to monopolise dates to the exclusion of local clubs. Far from it.

On the contrary, we are particularly anxious that our events should not clash with those of local clubs. As a matter of fact our fixtures of 1912 are very much the same as those of 1911. Secretaries were asked to attend the meeting at Olympia, armed with prospective dates, so that all had the same opportunity as we had.

We have a large membership and we must cater for them accordingly, but we hope not at the expense of other clubs.

C. C. COOKE, hon. sec.

Winter Mudguarding.

[6150].—I note with pleasure in last week's issue of *The Motor Cycle* that you published an article on "Mudguarding" in which belt protection devices were mentioned. I may say, as the outset, that I am an ardent advocate of the belt as being the most suitable means of transmitting the engine-power to the back wheel, and have used a similar device to that fitted to the Dot, as illustrated on page 1338, for the last four years, having in that time ridden practically 50,000 miles with various 8 h.p. twins. and always with sidecar attached, and have never once been troubled with a

es

suspicion of slip during the whole of that time, although I have been out in the most atrocious weather with mud ankle deep everywhere.

Had half the care and attention been bestowed upon belt protection that has been lavished on suitably enclosing chains, I am sure the belt would have more than held its own and not be regarded, as it now unfortunately is, as a very inferior method of drive. So confident am I of the superiority of this form of transmission, that I would like to take an "ardent chain driver" through the vilest possible weather and road conditions on a little match for a small wager, and at the finish for him to race me in removing and replacing his back wheel; lack of dirt on the hands to be counted as a point.

I wonder whether anyone will accept my challenge, my only terms being that he shall, as well as myself, use a sidecar. ERIC LONGDEN.

[6151].—I read with very great pleasure the article on "Mudguarding," by "H.D.T." in last week's issue. To say that the present motor cycle is "mud" guarded is to say what is not true. If one goes out on a really muddy day for a ten minutes' ride on a present-day motor cycle, one comes back covered with mud from top to toe, and this is, forsooth, what makers call "mudguarding." I call it mud encouraging.

I ride my machine—using it in my practice as a medical man—summer and winter, fine and wet, and in winter I clothe it in what I call petticoats; even then my belt slips in really wet weather. The belt is, at best, only a makeshift. When the public understand that a properly protected chain, or a shaft drive, is the proper transmission, then good-bye to the ridiculous belt, with its mess and slipping. Fancy a belt on a car. Cars used to have belts in days gone by, and very shortly we shall say "motor bicycles used to have belts."

If the makers would give us a moderate weight machine, which would go anywhere, require little attention and be silent, the average rider would be satisfied. A machine of the following specification would, I think, meet the wishes of the rider of, at any rate, middle age: Frame, dropped; mudguarding really efficient; enclosed chain or shaft drive; three speeds and clutch; all controls from handle-bar except one brake actuated by the foot, internal expanding; long footboards, in the form of a trough, high at the sides and in front; a really silent silencer; strong non-skid tyres (half the so-called non-skid tyres on the market are merely fantastical designs in the tread, and are of no use); engine, twin, about 4 h.p.; pan seat; machine to be sprung fore and aft; decent clearance between rims and forks (the present wheels are too close to the forks); all parts easily accessible and standardised; stand for both wheels; no bright parts, and, if possible, disc wheels. M.D.

Carbon Deposits.

[6152].—I see that Mr. W. Elder has analysed the sample of carbon which I sent him, and I must confess that I was amazed at the things he found it composed of. The presence of ferric oxide, volatile oils, and road matter is most alarming, and shows that, in these days of keen competition, hardly anything is free from adulteration. I really shall have to change my brand of tobacco, if it contains such foreign matter as this, for the carbon I sent Mr. Elder was nothing more nor less than the hard crust scraped from the bowl of my favourite pipe! In conclusion, I should like to congratulate Mr. Elder on his great analytical skill, and in expressing my thanks for his trouble to assure him that his analysis, if not strictly accurate, has at least proved extremely interesting. ARCHIBALD.

SUMMARY OF CORRESPONDENCE.

H. R. Ellis Coker wishes to learn the views of motor cyclists residing in Peckham and district who might wish to avail themselves of special motor cycle garage accommodation if such were provided. Letters should be addressed to him c/o the editor.

G. H. Fletcher wishes to thank the motor cyclist who rode a Douglas and helped the driver of a Rover car between Crawley and Horsham on the 3rd inst.

M.C.C. TENTH ANNUAL DINNER.

ON Saturday evening last the tenth annual dinner of the Motor Cycling Club was held at the Café Monico. The president of the club, Mr. Charles Jarrott, was to have taken the chair, but at the last moment it was announced that owing to the severe illness of his sister neither he nor Mrs. Jarrott, who was to have presented the prizes, was able to be present. Mr. Jarrott's place was ably filled by Mr. Robert Head, the chairman of the committee, who proposed the toast of "The King," wishing His Majesty a safe return from India.

Mr. Stenson Cooke then rose to propose the health of "The Motor Cycling Club," hereinafter to be referred to, he said, as the M.C.C. He was glad to note the club had progressed steadily since its inception; its 400 members were composed of the pick of the motor cycling movement. What appealed to him was that the club did not spend its substance in trying to reform the earth; it was friendly with the powers that be, it minded its own business, and kept to its sporting programme, and it was able to and did choose its own members.

He referred to the famous M.C.C. events—the London to Edinburgh run, the London to Land's End and back run for the Jarrott Cup, the team trial for *The Motor Cycle Cup*, and the London to Exeter winter run. The last-named event, he said, tickled his imagination. He hoped it would be cold, with a nip in the air—and a nip in the satchel—(laughter)—and a sprinkle of snow to make it Christmassy. He would think of the competitors that night, with bright eyes and blue noses; it made indeed a homely Christmas picture. He referred to the hill climb in France on the 17th inst., and announced that several sporting members of the club would take part or go over as spectators. He especially regretted the absence of Mr. Jarrott, and referred in glowing terms to the club officials, mentioning the new hon. secretary, Mr. Southcomb May, the only man (he is tall) who could sit behind *The Motor Cycle Cup* and yet be seen. He coupled with the toast the name of Mr. Arthur Candler.

The Retiring Secretary's Speech.

Mr. Candler, in reply, expressed his appreciation of the enthusiastic way in which his name had been received. The number of prizes on the table was a proof that the M.C.C. was a real live club. As Mr. Cooke had said, it had progressed steadily. At the annual dinner in 1903 there were on the table only three gold centre, three silver medals, and a cup.

Its growth had been largely due to the club's classic events. For the London to Exeter Boxing Night run they had received up to date eighty-six entries. He had no doubts as to the club's future. He vacated the position of hon. secretary when it was in a state of great prosperity, and he was sure that Mr. May would be found to be an excellent hon. secretary.

The club had members living as far away as Ceylon. Two of these, of whom one was Mr. D. J. Maitland, were forming the Ceylon M.C.C. on Motor Cycling Club lines. Mr. Maitland had presented gold, silver, and bronze medals to the club.

Mrs. Stenson Cooke then presented the prizes. Among those recipients who were received with great

applause were Messrs. O. C. Godfrey, A. J. Moorhouse (the winner of the Jarrott Cup), and A. B. Bennett, the hon. secretary of the Derby M.C.C., the club champions.

The Chairman afterwards proposed "The Visitors and Press." Mr. Head apologised for having to fill the vacancy caused by the absence of Mr. Jarrott. With the toast was coupled that of the ladies who helped to make these festive gatherings go, and the name of Mr. Robert Todd, the chairman of the Auto Cycle Union. Though the M.C.C. was not affiliated, it always abided by the rules of the Union, and held friendly views towards the governing body. He always regarded Mr. Todd as one of the best friends the M.C.C. had.

He would like to thank Mr. Stenson Cooke for the help his organisation, the A.A. and M.U., had always given the club. Among the visitors, he gladly welcomed the representative of the Derby club and of the S.E. London M.C.C., who ran second to the winners for *The Motor Cycle Team Trophy*. Among the members of the technical press, he mentioned the name of Mr. E. M. P. Boileau, of this journal.

Mr. Robert Todd, in reply, spoke first on behalf of the ladies, and then of the press. He referred to the various motoring organisations, and mentioned how much the movement was indebted to them. Thanks to these great combinations motoring has taken up the stand it has, while the motor cycle movement owed much to the Motor Cycling Club.

Presentation to the Retiring Secretary.

Mr. Head then presented to Mr. Arthur Candler, the retiring hon. secretary, a very handsome grandfather's clock, subscribed by the members as a token of the appreciation they had for Mr. Candler's invaluable services. Mr. Candler's health was then drunk with musical honours, and he replied in a few well-chosen words.

Mr. Robert Head subsequently proposed the toast of the absent president, who, he said, would only have been kept away by a matter of extreme urgency. The members, he was sure, would accord Mr. and Mrs. Jarrott their sympathy and condolence.

Mr. S. H. Fry, in his usual witty manner, proposed the health of Mr. Head, and with Mr. Head's reply the proceedings were brought to a conclusion.

The speeches were interleaved with a most excellent musical programme, for a large portion of which that clever entertainer, Mr. Ernest Cherry, an M.C.C. member, was responsible.

The L.C.C., at their last meeting, reversed the recommendations of their Public Control Committee, which were to the effect that applications should *not* be made for reducing speed limits on certain roads at Putney, Balham, Tooting, and Kensington. The A.A. and M.U. will oppose the applications, and will be glad to receive information from those who may have intimate knowledge of the conditions prevailing on any of the following roads: Putney Bridge and Putney High Street; Balham and Tooting, portions of the main road; Kensington, Cromwell Road and Gloucester Roads. The secretary's address is Whitcomb Street, Coventry Street, W.

Fusion of Liverpool Clubs.

There is a big possibility of all the motor cycle clubs in the Liverpool district combining and forming one strong and important body.

One Hundred Entries for the Winter Run.

Entries for the M.C.C. second annual winter run to Exeter have now reached a total of one hundred. A list of names received since our last issue went to press is given on another page.

Birmingham to York and Back.

We are asked to remind intending competitors that entries for the Birmingham M.C.C. winter reliability trial on Wednesday, December 27th, details of which appeared on page 1354 of our last issue, close at ordinary fees next Saturday.

Winter Road Trials.

The Auto Cycle Union has been criticised in some quarters for holding too many reliability trials. What would its critics say to a fourteen days' trial in December for pedal cycles, yet a trial comprising sixty-two miles a day over winter roads is engaging the attention of Parisian cyclists, about fifty different makes having been entered. Among the competing machines are a B.S.A. and a New Hudson.

Auto Cycle Union Notes.

MEMBERSHIP.—Eighty-two new members were elected at a recent committee meeting.

THE INTERNATIONAL ASSOCIATION OF ROAD CONGRESS.—It was decided to contribute a sum of money towards the expenses of the congress.

PERMIT.—A permit to hold an open reliability trial this month has been granted to the Birmingham and District M.C.C.

Twelve Hours' Trial to Gloucester.

The N.W. London M.C.C. twelve hours' reliability trial to Gloucester and back on Saturday, December 30th, is creating considerable interest, and a number of entries have already been received. The start of this contest is at 7.15 a.m. from Jack Straw's Castle, Hampstead Heath, and the route is *via* Stanmore, Pinner, Rickmansworth, Amersham, High Wycombe, Oxford, Farringdon, Cirencester, Gloucester, returning by the same route, the first pair starting from Gloucester at 2.2 p.m. It will be seen that Dashwood Hill has to be climbed on the outward journey and Birdlip on the return run. There will be an untimed non-stop from Hampstead to the top of Dashwood. The hon. trials secretary for this event is Mr. Glynn Rowden, 40, Frogna^l, Hampstead, N.W.

Reliability Trial in South Australia.

The annual reliability trial and speed judgment test of the Motor Cycle Club of South Australia was held over a course of 150 miles, including some severe hills, good roads, unmade roads, and sandy patches. A uniform rate of speed of twenty miles per hour was set, and eight secret controls were arranged *en route* to trap the scorcher. Those who made non-stops were: A. Moyle (3½ h.p. Lewis, water-cooled), 199 points; C. R. Churchward (3½ h.p. Lewis, water-cooled), 199; F. R. Linb (3½ h.p. Kerry-Abingdon), 198. H. H. Ragless (3½ h.p. Triumph) stopped to recover his hat.

Robert Weiss, one of the unfortunate victims of the Filey aeroplane disaster last week. He was a well-known Yorkshire motor cyclist.

SPECIAL FEATURES.

LUBRICATION SYSTEMS.

THE MOTOR CYCLE FOR POSTAL DELIVERY.

RUNNING COSTS.

Taxicab Drivers' and Owners' Liabilities.

E. J. Robinson, a motor cyclist of Warwick, has secured damages against the London and Provincial Taxicab Co. for an accident which occurred at Leamington on the occasion of the visit of the Prince Henry tourists to that town. The evidence proved that the driver of the cab was in the wrong, and his employers have had to pay. This is an interesting case, as one or two motor cyclists have informed us that cab owners, whose drivers have been involved in accidents, have repudiated liability on the ground that when the driver is paid by results he is not in their employ but on commission.

English Aeroplane Disaster.

Robert Weiss, of Heckmondwike, near Leeds, who was fatally injured in the most serious of English aeroplane disasters at Filey last week, was a well-known motor cyclist, and one time president of the Wakefield A.C.C. Mr. Weiss at one time owned a stud of motor vehicles, including one or more cars, a T.T. Triumph, a standard model of the same make, and a 6 h.p. Roc. At the last Sutton Pank hill-climb promoted by the A.C.U., our Northern representative had the pleasure of being in his company. Mr. Weiss was a passenger in Mr. Hubert Oxley's aeroplane on the 7th inst., when, in descending at an acute angle, a mishap occurred, and Mr. Oxley fell a distance of 80ft., and was killed instantly. His passenger died an hour later, having sustained a fractured skull and internal injuries.

Busy B's in the Winter Run.

The Brothers Bashall have entered sidecar combinations for the Exeter Run. J. T., the hour sidecar record holder, will drive his Bat, whilst W. H. will bestride a new mount, the 6 h.p. Royal Enfield.

A Motor Bicycle with Wire Wheels!

In the catalogue of an auction sale which has been sent to us, appears the following: "3½ h.p. Motosacoche, guaranteed, two-cylinder motor, etc., wire wheels." Fancy a motor cycle with wire wheels—and a 3½ h.p. Motosacoche, too!

Stolen Machine.

The following is a brief description of a motor bicycle which is alleged to have been obtained under false pretences from Mr. T. P. Nathaniel, Mill Bank Place, Uphall, West Lothian. The machine is a 1910 Bradbury with N.S.U. two-speed gear. The rear mudguard has been altered, also the stand. SX 90 is painted both sides of the rear number plate. If a machine following this description is offered to any of our readers will they kindly communicate with Mr. Nathaniel at the above address, or the police authorities at Scotland Yard?

A Variety of Exchanges.

The season of profitable exchanges is at hand. Among the offers in exchange for motor cycles in our last issue were the following: Gramophones and records, second-hand pianos, 6ft. billiard table, 6 and 8 h.p. cars, grey parrot and folding camera, piano player, upright and horizontal grand pianos, automatic lung tester, ladies' and gentlemen's push cycles, knife cleaner, gas fittings, diamond ring, etc.

In last week's issue a motor cycle appeared under the heading of "95° in the Shade." May one interpret this to mean that the engine is susceptible to over-heating?

The A.C.U. Six Days' Trials.

The Tamton and Cumberland Motor Cycling Clubs have extended invitations to the Auto Cycle Union to hold the A.C.U. Six Days' Trials in their respective districts. Both Somerset and its adjoining counties, as well as Cumberland, possess their share of hills. The A.C.U. has been in the North on previous occasions, but the West is almost unknown to its members. It seems almost certain therefore that a centre in the South-west of England will be chosen.

FUTURE EVENTS

Dec. 26-27.—M.C.C. Winter Reliability Run to Exeter and back.
 „ 27.—Birmingham M.C.C. Open Winter Reliability Trial.
 „ 27.—Dublin and District M.C.C. Open Reliability Trial to Waterford and back.
 „ 30.—North West London M.C.C. Twelve Hours' Winter Reliability Trial.

A special heading will be found in the miscellaneous advertisement columns for announcements of forthcoming club competitions.

Hill-climbing.

Nowadays, it is not a question of which steep hills a motor cycle will climb, but rather if there is a hill a motor cycle cannot climb. A number of readers have written in appreciation of our article "A Record Hill-climbing Expedition" suggesting further severe roads and hills in North Wales, Scotland, and Cumberland. Frank Smith writes that he will be pleased to conquer any hills or roads any of our readers may suggest, as he is anxiously waiting to hear of the hill his Clyno cannot get up.

A Schoolboy's First Tour.

The reproduction below is that of Mr. A. E. Hawkins, a Cheltenham schoolboy sixteen years of age, who during his

holiday this year rode from Cheltenham to Dewsbury (180 miles) in a day, starting at 6 a.m. and reaching his destination at 4.30 p.m. On the return journey he rode across country from Dewsbury to Beccles by Doncaster and Newark-on-Trent. Finally he rode from Beccles to Cheltenham in the day, a distance of 190 miles, the journey being accomplished without incident. Starting early, he reached Cheltenham before 5 p.m. For a hardened rider such journeys are not at all extraordinary, but for a boy of sixteen years, they are quite worthy of note. His mount was a 1908 Triumph, and he is eagerly looking forward to a similar trip next year.

English-Dutch Reliability Trial.

We have received too late for press this week, details of the International Reliability Trial between a team of Dutch and English motor cyclists to take place in Holland at the beginning of August. Entries are being invited from Dutch motor cyclists, and a dozen will be selected composed of six private owners and six trade riders. The same procedure will be followed in selecting the English team. Further details next week.

Yorkshire Judge's Extraordinary Outburst.

A highly important case, bearing on the liability of a local authority to pay damages arising out of a skid due to tarred roads, was heard on Wednesday week at Tadcaster. Plaintiff was a motor cyclist named Archibald C. Gray, a Leeds commercial traveller, who was riding towards Askham Bryan, and his machine skidded on the tarred main street of Tadcaster, where he said there were no warnings. The judge non-suited him. Worse than that, his Honour, Judge Templar, delivered himself of the following trenchant but amusing criticism of motorists in general: "Was it the only road in England? If you go on a tarred road you go at your own risk. The roads are not made for either motor cycles or motor traffic. They are made for ordinary people. Motorists seem to think the roads are made entirely for themselves, and for their own purpose. They are the greatest nuisance which ever came, and the sooner they are swept off the face of the earth the better. Another case of prejudice!"

BOY SCOUTS' GREAT FIELD DAY AT PORTSMOUTH LAST SATURDAY.

The Scouts' duty was to protect the common from the invading force. Lieut. Bostock, R.N., is captured trying to get through the cordon of scouts, and is seen being searched for dispatches—his motor cycle is hidden from view.

Motor Cycle Hill-climb in France.

BRITISH RIDERS TO COMPETE.

A NUMBER of well-known motor cyclists are crossing over to France next Saturday to take part in the open hill-climb on the 17th inst. organised by the Auto Cycle Club of France, the classes for which we enumerated in our issue of Nov. 23rd.

A fairly large entry has already been received from well-known French, German, and Italian riders, and the addition of such well-known English names as Arthur Moorhouse (Indian), W. Cooper (Bradbury), F. Smith (four-speed Clyno sc.), Hugh Gibson (Bradbury sc.), Stanhope Spencer (Rudge), and W. H. Bashall (Bat), gives it an international aspect.

Several interested motor cyclists are crossing over with the party, including Messrs. W. H. Wells and O. C. Godfrey, which will be leaving Charing Cross about noon on Saturday and return on Monday. The name of the hill is Gomez-le-Chatel, a severe rise about twelve miles from Paris and two and a half miles from Orsay, and the competition will start at 10 a.m. The Auto Cycle Union is fixing up all arrangements for hotel accommodation, and readers who desire to join the party should apply to the A.C.U.

The regulations are that all machines, except in two open classes (one for bicycles and one for tricars),

must be of the commercial type, i.e., "rigorously in accordance with maker's catalogue specification." The classes for motor bicycles (with the exception of the open class) are divided by cubical capacity, as follow: Class 1, 225 c.c.; class 2, 300 c.c.; class 3, 400 c.c.; and class 4, 500 c.c. Tricars: Class 1, maximum bore of engine, 90 mm.; class 2, open. There will be also a class for "voiturettes" built on motor cycle lines, those connecting links between the motor car and the motor cycle, and which we prefer to designate quadcars or runabouts. The list of entries, as we went to press, stood as follows:

MOTOR BICYCLES.

- | | |
|----------------------|------------------|
| 1. N.S.U. I. | 7. Alcyon II. |
| 2. N.S.U. II. | 8. Alcyon III. |
| 3. N.S.U. III. | 9. Alcyon IV. |
| 4. Austral I. | 10. Alcyon V. |
| 5. Terrot Motorette. | 11. Motosacoche. |
| 6. Alcyon I. | |

TRICARS.

- | | |
|---------------------|---------------------|
| 12. Mototri-Contal. | 13. Mototri-Contal. |
|---------------------|---------------------|

QUADCARS AND RUNABOUTS.

- | | |
|-------------------------|--------------------|
| 14. Ronteix I. | 18. La Ponette II. |
| 15. Ronteix II. | 19. La Trotteuse. |
| 16. Guerry Bourguignon. | 20. Bedelia. |
| 17. La Ponette I. | 21. Cohendet. |

French Road Race—Circuit de Me'un.

This event, organised by the Motor Cycle Club de France on the circuit which comprises Melun, Guignes, and Lissy, was held on Sunday last. The distance ridden was 127 miles. The original intention of the club was to hold a race from Paris to Havre, but this was frustrated by the authorities. The start was at 8 a.m., and the following riders and machines were sent off at minute intervals:

CLASS I.

- | | |
|------------------------|-----------------------|
| 1. De Vay (New Hudson) | 5. Cuzeau (Terrot) |
| 2. Jeaneau (Rochet) | 6. Grapperon (Alcyon) |
| 3. Brunet (Griffon) | 7. Dacier (Alcyon) |
| 4. Canale (Alcyon) | 8. Detrez (Peugeot) |

CLASS II.

- | | |
|-----------------------------|----------------------|
| 1. Comby (Motosacoche) | 4. Lacroix (Peugeot) |
| 2. Tickenheinrich (M'coche) | 5. Péan (Peugeot) |
| 3. Millan (Motosacoche) | |

CLASS III.

- | | |
|----------------------|-------------------------|
| 1. Casse (F.N.) | 4. Dubost (René Gillet) |
| 2. Gabriel (Triumph) | 5. Golaz (Motosacoche) |
| 3. Blanchon (F.N.) | |

CLASS IV.

- | | |
|---------------------------|--------------------------|
| 1. Gomo (Peugeot) | 5. Debaume (René Gillet) |
| 2. Naas (Griffon) | 6. Fay (René Gillet) |
| 3. Sandford (René Gillet) | 7. Théry (René Gillet) |
| 4. Meuriot (René Gillet) | 8. Vaudry (René Gillet) |

The race was run in a downpour of rain, and the survivors naturally finished with their machines and themselves covered with mud. Nevertheless, the contest cannot be described as anything but a success. Twenty-six competitors came to the post, and of that number twelve completed the seven circuits to make up the distance. High speeds under the circumstances were not to be expected, the fastest time being made by Dubost on a René Gillet of 489 c.c. His speed works out at thirty-seven and a quarter miles an hour—quite a good average, considering the

state of the roads and the high wind which prevailed. Next came Fay, also on a René Gillet, but of 1,147 c.c. His speed was thirty-six miles per hour. Gabriel on a Triumph, 499 c.c., was third in order of speed, being only 4m. 25s. slower than Fay. Dacier on a single-cylinder T.T. Alcyon, 298 c.c., was not far behind, and, considering the dimensions of his engine, his speed of thirty-three miles an hour, and the weight, he was placed first in the general classification. Lacroix rode a twin Peugeot, 332 c.c., and covered the course at an average speed of nearly thirty-five miles an hour.

Dubost's René Gillet had a single-cylinder engine, Ruthardt magneto, rigid forks, and upturned bars; the transmission was by belt, and the machine was provided with stand and mudguards. Lacroix's Peugeot was also belt driven, but had a slightly dropped bar, large round petrol tank, and mudguards, but no stand. The winning Alcyon was the same model that was ridden in this year's Junior T.T.

The Results.

CLASS I.—Cylinder capacity 200 to 300 c.c.

- | | H. | M. | S. |
|--------------------------------|-----|-----|-------------------------------------|
| 1. Dacier (Alcyon, 298 c.c.) | ... | ... | 3 51 58 ⁴ / ₅ |
| 2. Dera (New Hudson, 292 c.c.) | ... | ... | 4 29 42 ² / ₅ |
| 3. Detrez (Peugeot) | ... | ... | 5 59 4 ² / ₅ |

CLASS II.—Cylinder capacity 301 to 400 c.c.

- | | | | |
|------------------------------------|-----|-----|-------------------------------------|
| 1. Lacroix (Peugeot, 332 c.c.) | ... | ... | 3 39 18 |
| 2. Péan (Peugeot, 332 c.c.) | ... | ... | 3 56 0 |
| 3. Milland (Motosacoche, 343 c.c.) | ... | ... | 4 22 52 ³ / ₅ |

CLASS III.—Cylinder capacity 401 to 500 c.c.

- | | | | |
|-----------------------------------|-----|-----|-------------------------------------|
| 1. Dubost (René Gillet, 489 c.c.) | ... | ... | 3 24 21 ¹ / ₅ |
| 2. Gabriel (Triumph, 499 c.c.) | ... | ... | 3 36 7 ³ / ₅ |

CLASS IV.—Cylinder capacity 501 c.c. and over.

- | | | | |
|--------------------------------------|-----|-----|-------------------------------------|
| 1. Fay (René Gillet, 1,147 c.c.) | ... | ... | 3 31 42 ¹ / ₅ |
| 2. Meuriot (René Gillet, 1,272 c.c.) | ... | ... | 3 57 32 ² / ₅ |
| 3. Naas (Griffon, 964 c.c.) | ... | ... | 4 10 4 ³ / ₅ |

M.C.C. Winter Run to Exeter.

The following are the entries received for the winter run since the list published last week. The total is now 113 to date:

- | | |
|---|---|
| A. P. Maurice (3½ Premier and sc.) | J. A. Densham (3½ Rudge) |
| H. C. Mills (3½ Premier) | R. G. Mundy (2 Alcyon) |
| C. B. Duberly (3½ Ariel) | G. N. Higgs (5.6 A.C. Sociable) |
| S. Boswell (3½ Ariel) | G. L. Fletcher (2½ Douglas) |
| G. Wray (3½ Bradbury and sc.) | N. C. Dear (2½ Douglas) |
| P. W. Moffat (2½ Douglas) | F. E. Pither (10 Huru car) |
| C. F. Halsall (5-6 Clyno and sc.) | N. O. Soresby (3½ Rudge) |
| T. Tattersall (5-6 R.A.C.S.) | F. J. Watson (3½ Swift) |
| H. R. D. Simpson (4 M.M.) | J. Peachey (3½ Premier) |
| F. B. Webber (8 Morgan Runabout) | R. Clark (5-6 F.N. and sc.) |

| | A. Mabon (Rudge and sc.) |
| | D. S. Baddeley (P. and M.) |

Several of those named are prospective members whose names are included subject to election at the next meeting of the Motor Cycling Club Committee. The number of entries is already a record, but still more are expected. The start is from the Bulstrode Hotel, adjoining Heston-Hounslow Station, at 7 p.m. on the 26th inst.

AN AUTOMATIC OIL PUMP.

Mr. Joseph Sarolea has lately brought out a new semi-automatic oil pump. Referring to the illustration, the body of the pump consists of the tube 1, closed at its upper end by means of the cap 2, at its lower end by the plug piece 3, in which is the inlet passage 4, and the outlet passage 5. The rod 7 is hollow, and its interior is of square section. Through it runs the square rod 11, attached to the disc 12, so that when the handle is turned the rod and disc are also turned with it. The disc 12 rests on the plug 3, while the spring 13, pressing on the nut at the end of the rod 14, presses it close up against it. The disc 12 possesses a crescent-shaped groove 15 in part of its surface.

When this groove is above the orifice 4 it allows the oil to flow into the pump. When above the orifice 5 it allows it to escape to the engine. The progressive section of this hole allows regulation of the flow according to the amount the disc 12 is turned by means of the handle. The rod 7 carries an indicator 16 on the pump cover, which shows the amount of opening of the regulating disc. When the latter is in the position shown in the figure, the raising of the piston 8 has the effect of drawing oil into the pump through the orifice 4. It is possible then to turn the disc so as gradually to uncover the orifice 5, the orifice 4 at that time being closed.

STEERING FROM THE SIDECAR SEAT.

A patent steering arrangement made by Messrs. Bell Bros., of Manchester. (1) Showing the chief points. On the steering wheel is mounted exhaust lifter and carburettor control. The two connecting steering rods are adjustable. (2) When seated the wheel and column are lowered into normal position and kept there by a spring on the arched tubing at foot of sidecar.

CLUB NEWS

Liverpool A.C.C. annual dinner last Monday evening. Mr. P. Butler presenting the silver trophy to Mr. W. Heaton who rode a 2½ h.p. A.J.S. in the "banned" trial. Others in the group from the left are: Messrs. L. Mogridge (chairman), Clark (president), Baxter (captain), and Barton (hon. sec.)

Liverpool A.C.C.

A merry dinner party gathered together at the Bee Hotel on Monday night. With Mr. Percy Butler in the chair all went with vim. The room was rather crowded, many representatives of other clubs being present as guests. During the "smoker" that followed the challenge cup presented to the club by the Reliance Co., value fifty guineas, was handed to Mr. W. Heaton, of Manchester, the winner for the first year of the open two days' trial. In presenting this handsome trophy the chairman remarked that had the trials been carried out in their entirety as first arranged by the club, they would have been the best, if not quite the finest events of the year, and he fully expected that the future trials would equal any in the kingdom.

Mr. Barton (hon. sec.) said he hoped that at the meeting on Wednesday the amalgamation of clubs would come about; if so, the future of the sport and trials were assured.

Mr. Mogridge (chairman of L.A.C.C.) said that the holding of the open trial was the last straw to the A.C.U., like the last straw in the load of the camel.

Mr. Carty spoke of the difficulties yet to be overcome before the amalgamation took place, but expressed the hope that they would come to the meeting prepared to give and take and fall into line for the benefit of all. Mr. Carty's speech was followed by an excellent concert.

Bristol B. and M.C.

At a recent meeting of the Bristol Bicycle and Motor Club the following events were sanctioned, with the proviso that others should be carried out if necessary: April 27th, open hill-climb; May 11th, Taunton and back, *via* Wells, Polden Hills, and Bridgwater; June 15th, M.C.C. team trial for *The Motor Cycle* cup; June 29th, Oxford, *via* Birdlip, and back; July 20th, Keynsham-Pensford course; August 2nd-3rd or 3rd-5th, open road trial to Land's End and back; August 31st, members' hill-climb at Dundry.

M.C.U.I. (Ulster Centre).

The result of the reliability run recently held to Derry has now been announced and is given below. Of the nine riders who started eight completed the course. A broken belt fastener resulted in W. J. Adams (3½ B.S.A.) losing three marks before checking in at Toomebridge. I. I. Kennedy (3½ L.M.C.) arrived two minutes late at Dungiven, and lost one mark in consequence. G. Simpson (3½ Triumph) and I. R. Thompson (3½ B.S.A.) got ahead of schedule time, and arrived in Derry several minutes too soon; the former being penalised two marks, and the latter four marks. J. Stewart (3½ Triumph), J. Lavery (3½ Triumph), R. M. Lardy (3½ Triumph), and C. R. Martin (3½ Triumph) completed the journey without mishap of any description, and tied with full marks. The final adjustments, however, left the placings as follows: 1, J. Lavery; 2, J. Stewart; 3, R. M. Lardy; 4, C. R. Martin. It is worthy of note and rather remarkable that punctures were conspicuous by their absence, none of the riders having the slightest troubles with their tyres.

Some of the members who attended the Mersy M.C. dinner, at which the announcement of a probable amalgamation of Liverpool motor cycle clubs was made.

Club News.—

Haverstock M.C.C.

A new motor cycle club was formed with the above title at an enthusiastic meeting on the 6th inst., at the Prince of Wales Hotel, Prince of Wales Road, N.W.

Streatham and District M.C.C.

On the 6th inst. this club held the first smoking concert of the winter season at its headquarters, the Crown and Sceptre, Streatham Hill. The next item on the programme is a lecture at headquarters.

Sutton Coldfield A.C.

A lecture, illustrated by lantern slides, and entitled "Speed and Power," is to be given by Mr. W. G. McMinnies to the members of this club on Friday, December 14th, at 7.30 p.m. Tickets may be obtained from the Colmore Depot, Messrs. T. Clayton and Sons, William Bruce, Ltd., or the hon. secretary, Mr. Howard Smith, The Dingle, Four Oaks.

Mersey M.C.

The annual dinner took place on the 7th inst. at St. George's Restaurant, Liverpool, after which the prizes won during the year were distributed. Messrs. Jones, Philpot, Bethal, Carty, Morley, Harsman, Lake, Smith, Birch, Mason, Kershaw, Rees, Fox, Barker, Brown, and Rimmer were the recipients. A gold watch and gold medal were presented to Mr. H. Long for his ride of 40,000 miles in ten months on a Triumph. During the evening allusion was made to the proposed amalgamation of Liverpool clubs; this was received with enthusiasm.

Wolverhampton M.C.C.

A members' billiard tournament is to be held at the headquarters, King's Hall Restaurant, Central Arcade, on Monday, December 18th. Entries close on Friday, December 15th. Further events are as follows: The annual dinner on Saturday, January 6th, 1912, at 7 p.m.; the annual general meeting on Monday, January 8th, at 7 p.m.; a breakdown competition on Monday, January 15th, at 7.30 p.m.; a whist drive on Monday, January 22nd, at 8 p.m. All the above to be held at headquarters.

Cumberland County M.C.C.

This club recently held its annual meeting, dinner, and prize distribution at the picturesque old hostelry, The Pheasant, Piel Wyke, Bassenthwaite. The weather and roads being ideal, allowed a good muster of members of this widely scattered and rapidly growing club to assemble awheel. Headquarters have been acquired at the Great Central Hotel, Carlisle, where a room has been placed at the disposal of club members, and where motor cyclists passing through the city will receive a welcome. A number of valuable cups and other prizes having been presented for competition during 1912, a very successful season is anticipated. Joint hon. secretaries: Messrs. Hilton Robinson, Foul-syke, Loves Water, and William M. Milburn, Lome Terrace, Brampton.

Birmingham M.C.C.

R. W. Duke (Zenith) and R. H. Edwards (Triumph), the competitors left in the reliability trials, completed the fourth round last Saturday, and neither of them was "knocked out." The course was as follows: Birmingham, Kidderminster, Bewdley, Tenbury, Bromyard, Ankerdine Hill, Worcester, Droitwich, Bromsgrove, Halesowen, Mucklow's Hill, Birmingham—roughly, ninety miles. The competitors were accompanied over the course by V. Busby, on a 3½ h.p. Humber, who acted as checker. Busby unfortunately failed on Sunrising in the third round through being unable to change to his low gear before the engine stopped, the reason being that a skid on the corner had bent his footrests, so that he could not release his high gear. The roads were as bad as possible, especially Ankerdine Hill; it speaks well for both machines and their riders that they went through without a stop, as the course is considered difficult. Next week the course will be; start Fountain, Hagley Road 3 p.m., Halesowen, Stourbridge, Bridgnorth, Ludlow, Tenbury, Kidderminster, Mucklow's Hill, Birmingham. The ninth annual dinner and prize distribution will be held at headquarters on Friday, January 5th. Notices will be posted to members in a few days.

Durham and District M.C.C.

The annual dinner and prize distribution will be held on Saturday, 16th December, at the Neville's Cross Hotel, Durham. Members and friends are invited, tickets 2s. 6d. each. Mr. F. C. Wake, of Darkington, has been awarded the Aggregate Challenge Cup for competitions held during 1911.

York County M.C.C.

A club meeting will be held to-morrow (Friday), when a paper will be read by Mr. J. A. Prendergast, entitled "Scientific Tuning." The annual general meeting will be held on Friday, January 26th, at headquarters, the Grand Central Hotel, Leeds.

Blackpool and Fylde M.C.C.

A paper on "The Internal Combustion Engine" was read at headquarters by the hon. sec., Mr. J. E. Taylor, who, together with Mr. G. F. White, afterwards gave a demonstration on "The Timing of the Valves and the Setting of the Magneto." The membership of the club is at present fifty, and is gradually increasing.

South Birmingham M.C.C.

The first annual dinner of this newly-formed club, which is developing rapidly, will be held in January, and some matters of interest to competition riders will then be announced. Information can be obtained from the hon. secretary, Mr. L. Poole, 70, Poplar Road, Edgbaston.

Essex M.C.

An interesting paper was read before the members of the Essex Motor Club on Thursday last in the committee room of the R.A.C., Pall Mall, S.W., by Mr. Douglas Leechman, on "Motor Cycles Seen at the Recent Olympia Show." Mr. O. L. Summers presided. Mr. Leechman began by saying he noticed several welcome departures from the standard design so prevalent at the present time. Water-cooling, two-stroke engines, and the use of the decompressor which allows a part of the compressed gas to escape, were among the most noteworthy. He also commented on forced lubrication, roller bearings, and foot starters. He criticised the frame of the modern motor bicycle rather severely, and brought forward a pretty allegory to illustrate his words, which cannot, unfortunately, be reproduced on paper, though it was clear enough on the blackboard. He criticised especially the design of the head, in which the top and down tubes were brought to a point, the dropped top tube, and the use of the engine to brace the frame, while he mentioned the advantage of the loop. He referred to spring frames, and commented on the stability of these on greasy roads. Spring forks were also referred to, and he mentioned the Druid, Pilot, and Indian, as being especially good. Numerous members took part in the discussion, and at the conclusion of the meeting Mr. Leechman was enthusiastically applauded for his entertaining lecture.

H. P. Harrison, engineer in charge of the Lizard Lighthouse, and his twin cylinder Rex and sidecar.

Cost of Running a Motor Cycle.

More Replies to a Reader's Query.

Sir,—If you are still collecting statistics of running costs the following may be of interest. Machine, first-class 3½ h.p. T.T. roadster. Bought new March, 1911. Sold November, 1911. Distance run, 3,900 miles, all solo.

RUNNING COSTS.

	Per mile.
Licences	£1 5 0 = .077d.
Lubricating oil	0 11 6 = .035d.
Petrol	3 8 0 = .209d.
Tyres, patches, etc.	4 4 2 = .259d.
Belts and fasteners	1 0 6 = .065d.
Carbide	0 6 0 = .018d.
Bridge tolls	0 13 6 = .042d.
Sundries	1 7 0 = .085d.
	.786d.

CAPITAL CHARGES.

Interest (five per cent.)	1 17 0 = .114d.
Depreciation	13 19 0 = .860d.

£28 11 8 1.760d.

W. WOODWARD.

Sir,—As your correspondent Mr. Geo. Pirie remarks in your last issue, very few of the published letters work out the running expenses on a fair mileage. For this reason I venture to give a short statement of my expenses, of which I keep a careful record, over a mileage of 10,300 (by cyclometer) in two years. The machine is a 1910 Douglas, which, with accessories, cost £41 6s.

Petrol, 103 gallons at 1s. 2d.	£6 0 2
Oil six gallons Vac B. at 4s. 6d.	1 7 0
One new Dunlop tyre	1 16 8
Two retreads at 21s. and 17s.	1 18 0
Tyre repairs	0 4 6
Licences	2 0 0
Overhauling engine, renewals, and cleaning	6 6 8
Sundry parts, plugs, etc.	1 10 0
Belts (three)	2 1 6
Total	£23 4 6

Reckoning the present value of machine at £25, depreciation works out at .37d. per mile.

Those who are fond of going "all out" would probably not find expenses so low. I am content with 22-25 m.p.h., and, as a result have no stops and always get there. Punctures total only four, and the tyres are good for quite 2,000 more miles. I ride in all weathers and on all grades of roads.

A. M. COTTERELL.

Sir,—I have been reading with great interest the correspondence in recent issues of *The Motor Cycle* on the cost of running and upkeep of a motor cycle and sidecar, and have been astonished at the divergence of opinion on the cost of running per mile. Not being an owner of this interesting combination, it is rather difficult for one to understand what would be regarded as a fair estimate, and as a prospective buyer, it is a question of vital importance, not only to myself, but to many who, I am sure, would become ardent motorists, if one could be persuaded that motor cycling was not the "expensive amusement" which many claim it to be. Personally, I am inclined to think that motor cyclists who place the cost of running a motor cycle and sidecar at 2d. per mile are surely over-rating the figure.

Moreover, I should like to know if ten per cent. to fifteen per cent. depreciation is not in actual experience too great a percentage to knock off each year, provided the engine is supplied by one of our best engineering firms, and also whether the "renewals" are not placed at too high a figure for a well-cared-for machine. Surely a motor cyclist who averages from fifteen to twenty miles an hour on good roads, is not going to cause such wear and ultimate depreciation to his machine as to make up for the wide margin between the actual cost of fuel, namely, petrol at 1s. 3d.

per gallon per seventy miles (with sidecar), and the alleged cost of 2d. per m.i.e. or 11s. 8d. for every seventy miles, which means 10s. 5d. for depreciation, etc., lubricants, and renewals for every seventy miles ridden. There seems to be also a great divergence of opinion as to the average "life" of a back tyre with sidecar work.

I should be glad to hear some of the opinions of readers who do not use a motor bicycle and sidecar for test purposes, and who do not put their mounts to such excessive strains in record making and reliability tests, as to what a motor bicycle and sidecar can be run at with a normal load, say about seventy miles a week for pleasure purposes, with due care and attention in keeping the engine and running parts sweet, and not trying to exceed the speed limit. I venture to say that if this all-important economic question could be satisfactorily solved, and the public could be assured that motor cycling should not cost more than 1d. or 1½d. per mile with sidecar, inclusive of upkeep, it would make more converts to this interesting pastime than columns of statistics relative to speed records. F.R. (Sussex).

Sir,—How I envy those gentlemen who run their motor bicycles 5,000 miles per annum at a cost of ½d. a mile or thereabouts. I should simply love to know how it is done. Up to now I have been sufficiently ignorant as to think that a tyre on the back wheel of a 3½ h.p. machine will not last for 5,000 miles. But I daresay I am wrong.

I do not ride a 3½ h.p. myself, but one of the smaller twin variety, and some time ago started to keep a rough account of my expenditure in connection with it.

My chief expenses are tyres and valves; this latter item may seem peculiar, but I change my exhaust valve every 1,500 miles, because I hate the idea of one breaking. I had it happen once, and— But that is another story. Tyres seem to wear out remarkably quickly on the back wheel of my machine; in fact, I feel exceedingly pleased with myself if one lasts 1,500 miles; but perhaps I don't get the right sort of tyres for good solid wear. I do not mean to say that I buy 15s. tyres, but I do not go in for the "car tyre" types—just ordinary 2½in. touring types.

Sundry replacements, too, are a fairly large item in my expenditure, because I always fall off my machine an extraordinary number of times during a season; but I presume the farthing-a-milers never have any accidents of any description. My competition fees and club subscriptions run away with quite a lot of money; in fact, these alone account for a sum just under which Mr. H. Y. Peale can run his Triumph for 5,450 miles. IGNORAMUS INCREDULUS.

Sir,—I have read Mr. George Pirie's letter in your issue of December 7th, and I should like to say that I consider that his method of arriving at the running cost of a motor cycle is rather on the millionaire basis.

To take the first point, he makes a great thing of the annual overhaul; now in the case of the present day motor cycle what does the overhaul consist of? I find that it consists of taking everything down, thoroughly cleaning the engine inside, and perhaps fitting a new big-end bush or a new gudgeon pin or bush; the rest consists of taking down the cycle part bearings and packing them with grease and properly adjusting; this I find in most cases is done by the owners themselves.

Regarding sheds: I know many motor cyclists, but I do not know one who has had a shed erected specially for his machine, and I think that Mr. Pirie will find that the great majority of motor cyclists do not have special sheds. I have seen dozens of motors kept in the hall in small houses, and in some cases even sidecars with them.

I contend that the cost of motor cycling is, within reasonable limits, adaptable to the purse of the rider.

I have ridden various makes of machines from 1906 onwards, and I know that my running expenses have not been over 2d. per mile, and I have never had a repair done for me.

I also know that unless one buys a new machine every year the depreciation is not nearly £10 per year, about £5 is a very conservative allowance under that head.

WILLIAM LAURENCE

A Motor Cycle Tour in France and Germany.

B and I had been discussing and planning a holiday in the Vosges, with a car, for some eleven months, but it was only a few days before the date of starting that it was broken to me that I was expected to ride a motor bicycle, B's party having grown to larger proportions than he originally intended. In what I then considered a weak moment, I agreed, seeing before me a long vista of broken belts, broken valves, and strenuous labour on every hill. These were all recollections of an old Ormonde of several years ago, and I did not know the modern $3\frac{1}{2}$ h.p. mount.

My Machine.

However, I tried to look on the bright side, and took delivery of, a three-speed James one Thursday morning, which happened to be the identical machine ridden by Howard Newey in the A.C.U. Six Days' Trials, and on which the seals were still intact. I was duly shown "which lever did what," and then started on the lowest gear from Southampton Row to Gamage's. I had no sooner started than I found that motor cycles had altered considerably since the last time I had ridden one, and that the Armstrong change-speed gear and Amac carburetter, instead of the "jet in a pipe" that I remembered, made the machine easily controllable and handy even in the worst traffic.

In the afternoon I went for a short run just to get the hang of the thing, and returned home distinctly impressed.

Meanwhile, B and the rest of the party with the car had crossed over to France on Thursday, and were well on the way to Gérardmer, where I hoped to catch them up.

I crossed over to Dieppe on Friday night, arriving and getting through the Customs by about 3.30 a.m. and then refreshed myself with quite a good break-

fast and managed to buy a tankful of petrol from the waiter. The petrol arrived in an old wine bottle, but it smelt all right, so I put it in and hoped for the best.

By four o'clock it was beginning to get light, so after getting a few very hazy directions from a sleepy porter I started off on my way across France to join my party.

By this time I had already acquired considerable faith in the reliability of the machine, but had one abiding dread—the back tyre; this had a most salutary effect on my speed, but by steadily plugging along at a pace that would almost (but not quite) have been approved by the English police, I found that I had covered over two hundred miles and was beginning to feel like lunch.

More Haste — !

After lunch, it struck me that it was a great pity to go too slowly, and so I started to hurry up a bit, having a vague idea of reaching Gérardmer (170 miles) that night. I paid for this at once—in the back tyre, which not only punctured, but also had started to burst round the bead. Well, I was having a holiday and I did not propose to be upset by a back tyre or anything else, so after having a quiet smoke I very deliberately patched the thing up, using the greater part of a new handkerchief and an old strap. This carried me successfully to Vitry-le-François, and though it was only thirty miles from my luncheon place I decided to have the tyre properly mended and to put up for the night.

There was no trouble about finding a bed, but mending the tyre was a different matter, especially as the garage mechanic, in explaining the weak points of the rubber tube valve, succeeded in splitting the valve tube from end to end. The garage had not any valve tubing, neither had I, and at first things looked rather bad. In England one does not learn the really useful French words for an occasion of this sort, but after a short address to the mechanic—of which I think he followed the general idea—I went to call on the local doctor and explained the difficulty. He rose to the occasion like a man and produced some tube—I think they use it for feeding babies; however, it made a "topping" valve and lasted for the rest of the trip. The cover we mended by sewing a leather patch to the canvas lining, and this, with a few more stitches added at a later date, made a very effective and lasting repair.

On the Sunday morning I started off again, with only 150 miles to

A stop for petrol at Nagold.

The Schlucht tunnel. The writer's three-speed James in the foreground.

A Motor Cycle Tour in France and Germany.—

go, with the tyres apparently sound and the bicycle still running beautifully. During the morning I had a quite uneventful ride, stopping in Contrexéville for lunch and then going on, always on magnificent roads, through the beautiful forest of Darney to Remiremont.

Arrival at Le Tholy.

I was now only twenty miles from Gérardmer, and hoped to reach it in about threequarters of an hour. However, I had another puncture on the way and did not arrive until just on dark. Here I was delighted to meet B with the car, and, leaving the bicycle in the local garage, gladly accepted a lift to Le Tholy, where the others had decided to stay for a week or so.

Le Tholy was a tiny village perched up on the side of a hill some six miles back along the road I had just come by.

For the first two days I did not use the motor bicycle at all, as there was plenty to see, and I had had quite enough of it for the time being. However, B took it out once or twice, and quite agreed with me as to its good points.

On Thursday we decided to make an excursion to see the Ballon d'Alsace, one of the highest mountains in the Vosges, about thirty miles from Le Tholy. Consequently Wednesday morning was spent in changing the front tyre of the bicycle on to the back wheel and *vice versa*. This practically put an end to my tyre trouble, as I now had a Palmer Cord on the back wheel, and, bar picking up a zin. nail, this tyre gave no trouble for the rest of the trip, as might be expected.

We found the roads excellent as far as the foot of the Ballon, but the road up, which is about seven miles long with eighteen real hairpin corners, all banked the wrong way, was rather loose and rutty.

The view from the top should have been magnificent, but it was rather too misty for us to see much, though we were told that on a clear day one can see Mont Blanc, which is the best part of a hundred miles away.

Over the Col de Bussang into Germany.

Coming down was just a clean seven mile coast when one could appreciate to the full the advantage of a free engine. Halfway we stopped to have lunch, and then decided to cross the Col de Bussang into Germany before going back to Le Tholy.

This pass was about seven miles further away, and after about six miles we arrived at the French Custom

House, where our triptyques, etc., were examined and signed, and we went on to cross the actual frontier, which runs across the centre of a tunnel some two hundred yards long. This tunnel had a carpet of about zin. of dust, and as I was following a few yards behind the car I very soon had the full benefit of this, and had to aim for a small blur in the dusty darkness which I hoped was the other end.

We then ran down the German side of the pass on a magnificent road that was very pretty and beautifully graded.

On our arrival at the German Custom House we again got all our documents signed and took out German driving licences. The latter are wonderful productions, with huge red seals and tassels.

From Bussang we had quite an eventful run back into France to Le Tholy, having covered about a hundred miles on excellent roads and through splendid scenery.

This was the only run of any note that we made from Le Tholy, and on Sunday we decided to cross into Germany by the Col de la Schlucht and stay there for some days. This pass we found even better than Bussang, but one comes down very quickly into the valley of the Rhine and then has to cover some twenty miles of very uninteresting flat road. Each time we crossed this valley it was intensely hot, and the occupants of the car were well on the way to being roasted. The bicycle was far the coolest, and B and I took turns driving the car and getting cool

The sealing of the machine on the German frontier.

again on the two-wheeler. A welcome change!

Once across the valley, we started to climb up into the Black Forest, which is very similar to the Vosges, but rather wilder and more mountainous. Finally, we put up for the night at a little place called Titisee, which lay at the end of a lake in a little "cup" of the mountains.

This was a very attractive little place, and we were told that it was a great centre for winter sports. There is a very good hotel, where we decided to stay over Monday.

Monday was spent bathing in the lake and going for a walk (or climb) to the top of the hill at the back of the hotel.

On Tuesday we set out for Stuttgart, which is about 120 miles to the north-east. The first part of the day was quite uneventful, and we stopped for lunch just beyond Freudenstadt; after this the road became

A Motor Cycle Tour in France and Germany.—

steadily worse until we reached Nagold, where it was little better than a lane with an appalling surface. The road from Nagold to Stuttgart was quite good. Stuttgart is in a little hollow, and going down the hill into the town was like getting into a hot bath.

We were none of us very impressed with Stuttgart, and were thankful to leave on Wednesday morning. However, this was easier said than done, as we had decided to go back to Freudenstadt by a different road from the one we had come by, and when we had climbed out of Stuttgart into the air there was no sign of the road. Nobody's German was very good, and everybody's temper was pretty bad, and it literally took us nearly two hours to get clear of Stuttgart.

However, we finally found ourselves on the Freudenstadt road, but it was so late that we only reached Klösterreichenbach that night. Here we put up in an excellent and very cheap hotel, which we left early next morning, as the end of our holiday was in sight and we decided that we must push on towards Dieppe.

We reached Strasbourg for lunch on Thursday, and after seeing the cathedral and collecting our letters, pushed on, hoping to cross the frontier before stopping, but the Fates were against us. In the first place, B, who was driving the car, took the wrong road, and, secondly, while I was trying to take a level crossing, which the road zig-zagged across, rather too fast, the front tyre burst, and after following the line for a few yards, the bicycle and I turned a neat somersault into the road. Luckily there was not much damage done, either to the bicycle or myself, and having mended the tyre, straightened the foot-rests, and had a damaged knee most skilfully first-aided, we went on

another six miles to Saales, which is a village on the frontier.

Next morning my knee was uncomfortably stiff, but by using the low gear I found I could start the bicycle at a slow walking pace, and, once on, could get along quite comfortably.

Punctures and Punctures.

From this point the rest of the journey was absolutely devoid of trouble for me, though we had a succession of punctures, etc., in the car tyres. On Friday night we stopped at Ligny, and on Saturday at Rheims. We stayed at Rheims for Sunday, and spent the day looking round the town and patching up the tyres on the car.

On Monday we went to Compiègne and stayed the night there. Next morning we got up early and again amused ourselves with the tyres. These finished, we started up and reached Dieppe without trouble.

As B and I were both supposed to be at business next morning, we decided to cross by the night boat. The crossing will live in our memories as being a flat calm until mid-Channel was reached, after which the wind got up, and it got steadily rougher till Newhaven harbour was entered. The $3\frac{1}{2}$ h.p. James ran in a most exemplary manner, nothing save tyre trouble happened, and the Armstrong three-speed gear never gave a moment's anxiety. I cannot conclude without a word of praise for the Patchquick motor cycle outfit. Every patch held, and the solution was of the best.

Taken altogether, I should say that it would be very hard to get a better or cheaper holiday in any way than to go to the Vosges or Black Forest with a motor cycle, and I certainly want nothing better.

C.M.S.

Our party.

A typical example of the straight roads of France.

One of the few winding roads encountered.

STRAYING CATTLE.

The following High Court decision was given in an appeal by the C.T.C. against a County Court judgment which went against two cyclists who claimed damages for being knocked off their tandem by a cart horse straying on the highway:

"First of all, what is the duty of an owner or occupier of land adjoining a highway with regard to keeping animals off the highway or fencing his land so as to prevent animals getting on to the highway? By common law, there is no such duty at all and we have not to-day heard any argument as to whether any duty can be created under the

Highway Act. Suffice it to say by common law the owner or occupier of land adjoining a highway is under no duty to fence so as to keep his animals off the highway

In order to succeed in this case the plaintiffs would certainly have to show that even assuming the owner of this horse had been guilty of any negligence in allowing it to get on to the highway, they would have to show that the horse was one which, to its owner's knowledge, was of a disposition likely to cause the particular damage complained of. . . . Not only did they fail to establish it, but the County Court Judge upon the evidence found against them upon it."

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

3½ h.p. and Sidecar.

? Please let me know whether a 1911 3½ h.p. Humber, free engine and two speeds, would take a sidecar anywhere, and will you also state the average speed to be obtained with sidecar? Is the Service Co., Ltd., of High Holborn, a reliable firm to deal with?—A. J. S.

No: the machine would not take a sidecar anywhere, but it would over most places. 3½ h.p. is not enough for sidecar work, even with two speeds to take you over any hill in the country. You should average about twenty miles an hour with this machine. The firm referred to is quite reliable and has a good name.

Ducks on the Highway.

? I was riding my motor cycle one morning near a village; there were about eight ducks on the road, and just at the moment when I was passing the ducks crossed the road and my machine went over one of them and killed it. The owner wanted me to pay for the duck. What is the law? Must I pay or not?

We do not well see how you can be held responsible if you used every effort to avoid the duck. Judges vary in their opinions, and only last week the King's Bench decided that owners of land adjoining the highway are not required by law to fence the land to prevent animals and poultry straying on the highway. If the case were brought before a magistrate, there is little doubt that you would have to compensate the owner.

Building a Motor Cycle with Second-hand Parts.

? I am thinking of building a motor cycle with the help of a friend, but being very much a novice I find it rather difficult to buy the various parts. I am thinking of getting an engine of about 2½ h.p. Is it safe to build a bicycle of second-hand parts?—D.H.G.

We think you will probably find it will cost you more to make the machine and buy new and second-hand parts to put into it than to purchase a cheap second-hand one. It is quite easy to buy a machine which will go fairly well for quite a few pounds. For instance, an outlay of £8 or £9, if you selected carefully, might put you in possession of quite a respectable machine, and one which always has a market value.

Machine Damaged at a Garage.

? I left a motor cycle and sidecar at a garage in Winchester for repairs to the frame, and a new member was ordered from the makers and put in place. I wrote the other day to the garage people to tell them to have the machine ready for the road on a certain day. On arriving at Winchester I found the machine considerably damaged. The story I was told was that they sent the machine out with one of their men to see if it was running properly, and the pulley-wheel came off, and in applying the brakes the machine skidded and overturned on to a bank at the side of the road. The manager of the garage proposes that I should pay half the cost of the damage caused by his employee. Will you please let me know whether he is legally responsible for making good all damage caused by his employee or not?—J.H.K.

Our legal adviser writes in reply to above: "J. H. K." cannot insist upon the repairer making good the damage done, unless he can show that it occurred through negligent driving. I presume this would be very difficult to show. At the same time, if he is able to produce expert evidence showing that the motor cycle was in good condition when he left it, I should think that only slight evidence of negligence would be

required. Many garage proprietors protect themselves by stating that they will not be responsible for damage caused by employees when driving clients' machines. The above remarks are, therefore, subject to this not being stipulated."

More Power with Exhaust Valve Raised.

? We shall be very pleased if you can answer the following: We have a 5 h.p. Riley tri-car, and we notice that when we lift the exhaust valve very slightly on hills the engine gives off more power and runs more silently. Can you let us know why this is so? Do you think a 5½ to 1 gear on top with 28in. back wheel is too high, we mean with a passenger in front? Do you recommend a spring wheel sidecar in preference to a rigid one?—J. NABE AND SON.

This is a disputed point. The improvement may be for three reasons. First, that air is drawn into the cylinder when the exhaust valve is not quite closed and dilutes the mixture, and secondly that the compression is reduced, and thirdly, it may stop the valve chattering, or by bearing on the lifter lever the valve may rise higher. Try weakening the mixture by means of the carburettor, and it may even be worth while to reduce the compression. A 5½ to 1 gear should be about right. Yes, we think a properly designed spring wheel sidecar would be preferable to a rigid one.

LADIES' MOTOR CYCLES. The latest model open frame Hobart, with three-speed hub gear.

Powe ful Sidecar Turnout.

I propose going in for a Chater-Lea 8 h.p. engine for heavy sidecar work. (1.) Is it thoroughly reliable for hilly country? (2.) Would you recommend a free-engine clutch; if so, what make would be most suitable for a Chater-Lea (handle starting)? (3.) Would an 8 h.p. engine require a two-speed gear; if so, what make would be most suitable for that engine?—A.H.

(1.) Yes, we can thoroughly recommend the machine referred to. It is quite suitable for use in a hilly country with a sidecar. (2.) We should recommend the Chater-Lea three-speed gear and clutch, chain-driven, especially designed for sidecar work. (3.) Although an 8 h.p. can do a great deal without a two-speed gear, you would find a gear practically indispensable for general touring.

Broken Piston Rings.

Finding compression on my 4½ Fafnir engine motor cycle weak, I took the cylinder off and found the middle piston ring broken. This was replaced, and then, having valves perfectly ground in, I thought it was right, but, to my dismay, I found that the compression was no better. The valves were unaltered after a ten mile ride, so there was nothing else for it but to examine the piston head again. This time the other two rings were broken. I have fitted new ones again, which are a perfect fit, but I am naturally wondering how they will fare.—J.

As you have now replaced all your old piston rings it is probable that you will have no further trouble provided that those you have put in are of good quality. Piston rings do not often break, but nothing will last for ever.

Lubrication by Drip-feed.

(1.) My machine is a 4 h.p. J.A.P., fitted with the same firm's automatic drip feed lubricator. My trouble is to set this correctly. I am at present using Price's Huile de Luxe, and if I set the needle valve at half a turn, or at two complete turns, it makes no difference to the running of the engine, only, of course, increased oil consumption. As I am rather afraid of seizing up, I oil rather excessively than the reverse. As my machine is not fitted with pedals it is impossible to set the lubricator on the stand to so many drops a minute. (2.) What mileage should I obtain with a .030 jet from a gallon of petrol, average about 15 m.p.h. on level roads? I am using a B. and B. carburetter, 1908 or 1909 pattern, with no choke tube. Would a choke tube give less petrol consumption? (3.) Do you know if the B.B. people make a hot air inlet adaptable to their 1908 model?—P 3632.

(1.) If you set the valve open half a turn it should be quite enough, especially if there is a reasonable amount of oil in the crank case. If the engine shows signs of flagging immediately turn on more oil. (2.) The mileage should be about 80 m.p.g. A choke tube would not cause a larger consumption of petrol, provided you can govern the extra air to suit. To the best of our recollection, Messrs. Brown and Barlow, Ltd., do not make a hot air inlet adapter to this model.

Responsibility of Taxicab Driver.

On returning from a ride (motor bicycle and sidecar) about 7.30 p.m., I left the machine standing outside my house, and within ten minutes a taxicab rounded the corner and dashed in on it, doing damage to the extent, roughly estimated, of between £5 and £10. The driver is entirely at fault for careless driving, and this is admitted by an officer of police who viewed the place of the smash and was informed the circumstances. I have seen the owner of the cab, but he practically refused to discuss the matter, and disclaimed any responsibility of a claim for damages, stating that the driver was employed on commission, and that any claim would be against the driver. I should be greatly obliged if you would give me your advice on the matter. I am afraid it is very unlikely that the driver would be able to afford to pay damages.—A.E.

Our legal adviser's opinion of the above case is as follows: "I observe that no question is asked with regard to general liability. The only point put to you is as to whether the cab owner or the driver is responsible, the driver being employed on commission. This question is a difficult one to answer accurately, as so much depends upon the exact facts. The real point is, is the relationship between the parties that of master and servant or that of bailor and bailee? There are many cases which show that, so far as the public are concerned, very little is required in order that the cab drivers may be deemed to be the servants of the proprietors, but a case decided last year rather upsets the view. This was under the Workmen's Compensation Act, where it was held that the driver of a taxicab, who was paid no wages, but received one-fourth of the takings, less cost of petrol, was not a workman working for an employer within the meaning of the Act. This was held on the particular facts of the case, and the only way for your correspondent to

be properly advised is for him to ascertain the exact relationship between the owner of the cab and the driver thereof, and either write you again or consult a solicitor. The mere fact that the driver was paid by commission does not prevent him being a servant."

Swansea to Whitby.

Would you be good enough to give me the best route from Swansea to Whitby, and also about what time the journey should occupy? My mount is a late 1911 Kerry-Abingdon.—W.E.J.

Your best route would be as follows: Swansea, Merthyr Tydfil, Abergavenny, Hereford, Ledbury, Tewkesbury, Evesham, Alcester, Stratford-on-Avon, Warwick, Rugby, Market Harborough, Weldon, Stamford, straight up the Great North Road, through Grantham, Newark, Retford, Bawtry, Thorne, Doncaster, Malton, Weighton, Great Driffield, Scarborough, to Whitby. The journey, conservatively, it would take about two and a half days at this time of the year.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"Perplexed" (Perth). 76 x 85 mm. J.A.P. engine, slowest speed with cylinders firing regularly, and best carburetter.

"C.E.R." (Stonehaven).—Roc., N.S.U., and Fit-all gears with Triumph sidecar.

"R.C." (Bristol).—Armstrong, or Sturmev-Archer three-speed gear, fitted to 4½ h.p. single-cylinder with sidecar.

"B.L." (York).—Oscezi pneumatic saddle, comfort and life of air tubes.

"C.B." (Clapham, Yorks).—Any 8 h.p. J.A.P. engine, two-seated four-wheeled runabout, particularly with regard to hill-climbing, comfort, wear, and reliability.

"A.W.T." (Lewisham). 1911 James for occasional use with sidecar, silence, advantages of magneto position, and heat to rider from engine.

The finalists in the New Brighton (New Zealand) race on the sands. W. H. Jones (3) h.p. Kerry-Abingdon) was first and made fastest time in the five miles race. There were twenty-five competitors and the race was watched by 5,000 people.

A Free Engine Hub.

This is a hub of the type in which the engine can be started by pedalling with the rear wheel stationary on the ground. The belt pulley is made in the form of a drum: A, having an internal sleeve B, of non-circular section, transmitting the drive to the driving members of a plate clutch C. The driven members of this clutch always rotate with the hub shell and are carried in an extension thereof,

D. The plates are normally pressed into engagement by springs E, but may be withdrawn when required by pins F carried by a sleeve G, moved inwards

through the medium of a push rod, and actuated by the quick-screw and nut device H. To enable starting to be effected by pedalling, the chain sprocket J is mounted at K and connected to the sleeve L by means of a free-wheel clutch arranged at M.—J. C. Harris, No. 12,506, 1911.

An Interesting Tyre Improvement.

The principal defect of butt-ended air tubes is the liability of the ends to burst, due to the inability of the air to circulate during the rotation of the wheel. This is obviated by the reinforcing liner A which comprises two pockets B and C, between which is a supporting, but extensible partition D. The tube

ends are inserted in the pockets B, C, and the support afforded prevents the trouble referred to. With the reinforcing liner is combined a security bolt E.—C. S. and J. A. Challiner, No. 1,395, 1911.

A Saddle Improvement.

The object of this construction is to impart to the fore part of the saddle some proportion of the resiliency afforded at the rear. The seat portion A is sustained at the rear by compound springs B, the upper ends of which are carried by the frame members C. The fore part of the saddle is supported by a pair of

levers D pivoted at E and F, a coil spring being inserted between each movable lever D and the fixed frame member C. By this system a certain amount of vertical movement is afforded to the saddle peak.—J. B. Brooks and J. Holt, No. 24,517, 1910.

Seasonable Gifts.

A. W. Gamage, Ltd., inform us that for the convenience of their motoring patrons a side entrance has been made in Leather Lane in order to avoid the crush at their Christmas bazaar.

To Swell the T.T. Fund.

With regard to Mr. Hitchin's offer of exhaust whistles at a special price to swell the T.T. fund and recently referred to, we are begged to state that these may be had on approval if desired.

A Neat Throat Protector.

We have received from the A K. Manufacturing Co., 35, Swaine Street, Bradford, a serviceable throat protector, made of soft pliable leather, lined with silk cushion cord. It is the very thing for

winter riders, keeping this vulnerable part of the anatomy warm, and effectually warding off the wind. With a leather muffler it is claimed that one does not feel the cold so much as when discarding a heavy woollen wrap. It is sold in assorted shades with adjustable press button fastening, giving half sizes.

Adjustable Valve Stems and Connecting Rod Design.

We are requested to point out that the adjustable valve stem and design of connecting rod on the Blumfield twin-cylinder engines, referred to on November 20th, page 1322, are covered by provisional patents Nos. 25726 and 25727, 1911.

Catalogue Received.

The latest illustrated catalogue of the New Hudson motor cycles is to hand. This contains excellent half-tone pictures of incidents connected with competitions and tours in which New Hudson machines have taken part. The chapters on how to manage the machine in the garage and on the road, and some hints for sidecarists, are of practical use to riders of any machine, and copies can be obtained on application to the New Hudson Cycle Co., Ltd., Birmingham.

Lamps and Science.

The directorate of the Science Museum, South Kensington, have placed an Auto-clipse lamp with anti-dazzling mechanism amongst their exhibits under the head of lighting appliances for vehicles. The sole agents for these lamps, Brown Bros., Ltd., 15, Newman Street, Oxford Street, W., inform us that the report of the directorate is that they consider the scientific (hyperlenticular) principle (whereby the back of the flame is accurately focussed on the reflector, and the front on the lens) is the most perfect system of light projection. All Auto-clipse lamps are made on this principle.

Quadrants in London.

Messrs. Cass's Motor Mart, 5, Warren Street, Euston Road, W., inform us that they have been appointed sole London agents for the Quadrant motor bicycle.

Clean Hands After Repairs.

We have been trying a new motor soap known as "Savand," the invention of R. Thomson, chemist, Elgin, N.B. This is one of the best preparations for the hands we have yet used. Being a powder, it is clean, economical, and effective; and a little put on a nail brush will work wonders, even when the hands are at their grimmest. In our opinion, it would be still more satisfactory if it were sold in tins instead of cardboard boxes, which are liable to be crushed.

A Wire Trouser-guard.

The trouser guard illustrated is one introduced by J. B. Dall, Ladybank, Fife, and is the subject of a provisional patent. The spring is merely stretched in front of the valve chambers, and the

eyes provided are slipped over hooks on the rings fitting over the induction and exhaust pipes. The tension of the spring holds all securely. It is very neat, and a good point is the fact that it may be fitted to any make of single-cylinder without the aid of tools. Further, it offers the least possible resistance to cooling.

THE . . .

ZENITH-GRADUA

WITH INFINITELY VARIABLE GEAR—

has over and over again proved itself the best of the bunch when it comes to hill-climbing. This is because of the remarkable simplicity of the Gradua Gear. Just a few turns of the actuating handle, and

You can suit the Gear to any Gradient.

THINK WHAT THIS MEANS.

The 6 h.p. Twin Zenith-Gradua fitted with Gradua Variable Gear.

No matter what variations of gradient occur you always have exactly the right gear. The advantages of this are shown by the numerous Zenith successes, and are appreciated by all Zenith Owners.

Write for full particulars of the 1912 models of these wonderful machines.

What, Lubrication!

*Watch your Drops (of oil) and the Gallons
will take care of themselves.*

Every drop of "RUSOLINE" Motor Oil
counts and has full oiling efficiency.
It gets right between the rubbing
surfaces of the closest fitting bearing,
reduces friction to a minimum, and
gives you an all-round good result. For
motor cycles and other fast revolving
engines try Russell Bros.' products. We
don't sell on our name alone, but on
the good quality of our goods.

Manufactured under the supervision of
W. RUSSELL

Have you made up your mind

what your new model for 1912 is going to be? If you have, let me quote you. If not, get my advice. It will cost you nothing, and I can assure you it will be valuable to you. If you want a perfect machine, you cannot beat either of the following: 1. Rudge, Douglas, and B.S.A. Here you have the cream of the world's motor cycles, and you won't be disappointed in delivery. I can give you a specified date for any of the above motor cycles. Why pay premiums for scarce makes? Because the output is small. It is a big point to you to save your money. You can have your first year's running free if you save it in first cost. Send me on your enquiry now. I have 200 1912 models of the leading makes to book up for specified dates, so you won't lose your tempo if you order through me. I won't disappoint you. What I say I do I will do. Prove what I state by sending your order now. If you want a good second-hand machine I am your man. Every motor cycle sold by me has our reputation behind it, and we won't lose our good name for all the trade in the world. We guarantee every machine we sell to be in perfect condition. We are the only firm who do this, and why we can do this is because every machine we take in exchange is seen by us before approval. We don't take any rubbish. For a good machine we give a good price. We do not entertain accumulator machines. Good Magneto Motor Cycles bought for cash.

I have a splendid stock at present. A glance through will convince the most sceptical that we are sellers of only good motor cycles.

ACTUALLY IN STOCK—

2½ h.p. F.N., with improvements; £35, or near offer; can be seen any time at Bonds, 53, Willesden Lane, Kilburn.—Enquiries to Bach, 134, Maida Vale, London, W.

TRIUMPH, 1910½, horn, carrier, kit, magneto cover, etc.; reason sale, bought free engine same make; bargain; £34; first cheque.—Triumph, 16, Belvedere Rd., Norwood, S.E.

IF You Want Bargains in second-hand motor cycles, you can get them at Wauchops'—Wauchops's, 9, Shoe Lane, Fleet St., London, E.C., just off Ludgate Circus.

1911 Rudge, free engine, in perfect condition, Cowey speedometer, F.R.S. lamp and generator, full set of tools and spares; £42.—W. H. Elce, 5, Eastern Rd., Romford.

MOTOR BICYCLES FOR SALE.

TRIUMPH, 34h.p., free engine, with sidecar complete, perfect condition, price £30; also **Miserva**, 24h.p., in good running order, £6/10.—Newham, 223, Hammer Smith Rd., W.

34h.p. Brown Frame, 21in., 1908, stand, carrier, tank, wheels, tyres, footrests, brake, £6; 24h.p. Quadrant, new tyres, £4; 24h.p. Brown, perfect, £6.—Clayton and Mitchell, Wallington.

YE Knuts, look!—1911 T.T. Triumph, in new condition, brand new Kempshall non-skid back wheel, will do 63 m.p.h., horn and pump, etc.; £37.—Axiord, 9, Church Rd., Croydon.

TRIUMPH, 34h.p., Bosch magneto with guard, spring forks, head lamp, horn, tools, sundry spares, excellent running order; supplanted by car.—6, Star Rd., North End Rd., London.

MINERVA, 22h.p., splendid condition, spring forks, fast, reliable, Amac, h.b.c., Whittle, etc.; Kerry, 24h.p., good condition, low, very cheap; offers.—13, Eleanor Rd., Waltham Cross.

1910 T.T. Centaur, 34h.p., adjustable pulley, drip feed lubrication, new back cover, powerful mount, P. and H. lamp, spares; any trial; £28.—Moore, 51, Randolph Rd., Gillingham, Kent.

1910 24h.p. Motosacoche, magneto, free engine, in perfect condition, with spare belt, cover, valves, also watch, cyclometer, lamp, horn; £20, lowest.—Morgan, 3, Fenchurch Buildings, E.C.

1911 Triumph, with Jones speedometer, lamp, horn, suit of clothes, etc., purchased September, ridden 600 miles only, absolutely as new; £42, cost upwards £60.—E. McGrath, Gillingham, Kent.

4h.p. N.S.U., magneto, spring forks, in perfect running order, overhauled this summer, new magneto, cylinder and back tyre; £22, or near offer.—Write, Chalmers, 33, Hyde Park Gate, S.W.

1911 34h.p. B.S.A., nearly new, ridden very little, all tools and spare valve, lamp, horn, generator, Mahon free engine clutch; £45, or somewhere near it.—Harry Basball, Elm Grove, Ockham, Surrey.

MOTO-REVE, 1910, twin, spring forks, magneto ignition, Hutchinson tyre, exceptionally fast and reliable, recently thoroughly renovated; £17/10, for immediate sale.—130, Brixton Rd., S.W.

QUADRANT, 34h.p., spray carburettor, h.b.c., recently overhauled at cost of £6, new front tyre, very fast, good hill-climber, spring forks; bargain, £10.—Lloyd, Backwoods, Lindfield, Sussex.

1911 34h.p. T.T. Roadster Triumph, Lucas lamp, horn, spares, been 60 miles, practically new, guaranteed perfect; best offer inside 4 days gets this machine.—Lt. A., Artillery Mess, Woolwich.

34h.p. Chater-Lea, Nohle, perfect condition, h.b.c., new tyres, new Lyso, Price's stands, spare belt, accumulator, coil, etc.; £12, or nearest offer.—Lovell, "Sherwood," Brunswick Park, New Southgate.

1907 Triumph, complete overhaul by makers, with Brooks saddle, B. and B. cylinder all 1911, adjustable pulley, absolutely reliable, 8 to 45 m.p.h.; £25, lowest.—Swadling, 9, Electric Parade West Norwood.

5h.p. Peugeot, Chater-Lea, magneto, Amac, carrier, stand, lamp, horn, studded cover on rear, Palmer front, very fast, and condition as new; £26.—F. Cox, "Feradale," Buckingham Rd., South Woodford, N.E.

TRIUMPH, free engine, new October, 1911, little used, complete with Lomax steel-studded band, carrier bag, lamp, horn, all spares, £48.—Box No. L5150, The Motor Cycle Offices, 20, Tudor St., E.C.

MATCHLESS, 6h.p., 1911, perfect condition, bought July, engine ticks over at 5 m.p.h., extraordinarily flexible, new back cover, grand machine; bought 1912 Matchless; £49.—Hall, 4, The Avenue, Brondesbury, N.W.

ZENITH, 1911, noder 3,000 miles, Autoclipse lamp, Cowey, Vivid sidecar, watch, spares, Serpentine horn; actual total cost £70, take £52, or minus sidecar and Cowey £46.—Letters, W. C. Ellis, 18, Aldermanbury, E.C.

TRIUMPH, 1909 model, free engine, Mahon clutch, magneto, spring forks, Whittle belt, Dynalops, machine very little used, and in beautiful condition, really trustworthy and reliable; accept £35.—101, South Norwood Hill, S.E.

3h.p. Advance, perfect condition, enamel and plating as new, Stanley, Michelins, adjustable pulley, foot brake and boards, fixed toolbox and bag, lamp, long and low, 26in. wheels, suit gent; price £17.—Manager, 2, Station Rd., Acreley, S.E.

1911 N.S.U., 7h.p., been 100 miles only, £38/10; also 5h.p., 1911 Zedel, Chater-Lea, good as new, £30; and 5h.p. Peugeot, Chater-Lea, just been rebushed last week, £22; all the above seized for debt.—653, Rosendale Rd., West Dulwich.

TRIUMPH, 1909, overhauled and re-bushed by makers in June, magneto re-wound and re-magnetised last month, not a loose bearing on machine, condition and tyres perfect; £30, or nearest.—Apply by letter, K. Greig, 2, Ravenna Rd., Putney.

KERRY-ABINGDON, 34h.p., late 1910, lamp, tools, spare valves, B. and B., Rom back, fine condition; £30; any trial; or would exchange with cash for 7-8 h.p. free engine, 2-speed Matchless, or Bat-Jap.—Mott, Kenton, St. Leonard's, East Sheen, S.W.

New Accessories indispensable to the Motor Cyclist.

Fig. 375. This handy accessory provides a portable light at night for use on the road or in the garage; the light is reflected in any desired direction by means of the mirror; the whole apparatus can be coiled up in tin neatly and carried in the pocket or toolbox. Price 1/9 complete.

ALL METAL SWITCH.

Fig. 432. An entirely new type of handle-bar combined switch and cut-out—extremely simple—cannot get out of order—never gives trouble. It is perfect to the last degree. Suitable for magneto and coil ignition. Price 2/6 each.

SPARKING PLUG COVER.

Figs. 245 & 246. A really valuable little accessory which is absolutely fire-proof, damp-proof, and unbreakable—made in two sizes to suit all sizes of sparking plugs, and can be cut to any desired length; no motorist can afford to be without it.

Price 6d. each.

Write for new 12 page list—No. 80—just issued—post free, from

A. H. HUNT, 116-117, Cannon St., LONDON, E.C.

MOTOR BICYCLES FOR SALE.

MOTOR Cycle, 24h.p., h.b.c., new Michelin, all complete, perfect, new Bowden cable brake, new lamp and generator, pair spring forks; bargain, the lot £7/10; owner giving up riding, doctor's orders; appointment.—W., 3, Downhills Park Rd., Tottenham.

A ZENITH-GRADUA (September, 1911), 34h.p., in perfect condition, not ridden 1,000 miles, complete with horn, Lucas lamp, generator, watch, mirror, exhaust whistle, Cowey speedometer, and spare tube and cover, all as new; £48 quick sale.—Seen, 18, Ladbroke Grove, W.

REX, 1910, Isle of Man T.T.; this machine was sent over as spare for the race; twin 5h.p., as new, tyres, belt perfect, very fast, tremendous acceleration power, winner of many hill-climbs, overhead inlet, Bosch, ready for road; £30.—Stanley Collier, The Shrubs, London Rd., St. Albans.

1911 34h.p. Rex Tourist Model, used trial runs only, new condition, magneto, spring forks, Cantilever saddle, lamp, generator, horn, spare valves, spare tubes, etc., full kit tools; will ride 100 miles to genuine purchaser; bargain, £35; consider accumulator machine part.—"Rex," 101, South Norwood Hill, S.E.

1911 34h.p. Bradbury, free engine clutch, specially fitted up Cowey speedometer, Lucas best lamp set, magneto control on handle-bar, Rom tyres all wheels (combination non-skid back), spare belt, butt tube, valves, etc., horn, carbide carrier, everything perfect condition, seen little use; cost over £60, accept £41; also rigid sidecar to suit, £4.—"Ivydene," Dukeshorpe Rd., Sydenham, S.E.

TOTTENHAM—1912 Models; definite deliveries; Bradburys—2-speed, T.T. free engine; Humbers—lightweight twin, 3-speed 34h.p., 2-speed, 34h.p. standard; Rudge-Whitworth—34h.p., standard, 34h.p., free engine; all from stock; Triumphs, February; Clyno, four weeks; early deliveries Bats, Matchless, and A.C. Sociables; cash or exchange.—Below.

TOTTENHAM—1911 models in stock for immediate delivery, new; heavy reduction on shop-soiled machines; Bradbury, free engine, 2-speed, and standard models; Triumph, standard; Rudge-Whitworth, free engine.—Below.

TOTTENHAM—1911 models, second-hand—34h.p. Hummer, 2-speed gear, £42 (July); ditto, £42; 1910 models—2-speed Hummer, 34h.p., £35; ditto, £33; Roc, 4h.p., 2-speed, £32; F.N. lightweight, 2-speed, £32; Motosacoche, P.E., £24; miscellaneous—34h.p. M.M.C. magneto, £20; 4h.p. Fafnir, magneto, £27; 5h.p. twin Kerry, free engine, and sidecar, £20; 5h.p. twin Kerry, magneto, £20; N.S.U., twin, 6h.p., variable gear, £28; ditto, 2-speed gear, £28; Triumph, 34h.p., £17; triars, 4h.p. Riley, 34h.p. Triumph, 4h.p. White and Poppe, all good, £12 each to clear; cash, easy terms, or exchange.—Stamford Hill Motor Co., 128, High Rd., South Tottenham. 'Phone: 1982.

1912 New Hudson, Premier, Enfield, Bradbury, Rover, Hummer, and Triumph motor cycles for early delivery; Matchless in 6 weeks from order; cash or easy terms; exchanges for any machine arranged; best value allowed; Chater-Lea Duo cars built to order; speed gear conversions, overhauling, and repairing carried out; all work guaranteed; moderate charges; estimates gladly given; 10 years' motor cycle experience.—Wallace Motor Cycle Co., 36, Clarence St., Kingston-on-Thames.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

DOUGLAS, 1912, all models; any date delivery given; list post free.—Moffat, Yeovil.

1911 34h.p. 2-speed Hummer, 38 guineas; perfect condition.—T. E. B. Jourdan, Tiverton, Devon.

1909 Douglas, splendid condition, spare belt, spares; £22/10, or offer.—Vivian Gerish, Bathaston, Bath.

1911 Fafnir, 80mm., Chater-Lea, with accessories; £26.—Bryant, 15, Claremont Crescent, Weston-super-Mare.

BROWN, 1908, 34h.p., 2-speed gear, Bosch magneto, h.b.c., N.A.B. saddle pillar, reliable machine.—Baker, Beaworthy.

34h.p. Magneto Machine, h.b.c., just thoroughly overhauled and enamelled, tyres good; £17.—Mumford, Bankside, Sturminster Newton, Dorset.

DAN GUY, Weymouth.—1911 Triumph, Mahon free engine, as new, guaranteed not ridden 1,500 miles, lamp, tools, Cowey, perfect order; £44, no offers.

DAN GUY, Weymouth.—Lightweight Douglas machine, engine thoroughly overhauled by makers; £10.

DAN GUY, Weymouth.—34h.p. Rex, accumulator, good running order; any trial; £8.

DAN GUY, Weymouth.—1910 Douglas, Roc 2-speed gear, guaranteed condition; £32.

DAN GUY, Weymouth, sole Triumph agent, gives definite and early date delivery of 1912 models.

DAN GUY, Weymouth, sole Bradbury agent, Weymouth, Dorchester, and district; early delivery new models.

DAN GUY, Weymouth, sole Douglas agent, Weymouth, Dorchester, and district; deliver all models December.

DAN GUY, Weymouth, sole Bat agent; definite dates of delivery new 2-speed chain model.

DAN GUY, Weymouth, sole Zenith agent, Weymouth, Dorchester, and district; deliver all models December.

A French Awakening

THE popularity of the motor cycle in France has been waning for some time past, but there are distinct evidences of a revival if one may judge by the winter competitions inaugurated by the Motor Cycle Club de France and the Auto Cycle Club de France. The first-named body held a road race on the 10th inst., which was described in our last issue, and the latter a winter hill-climb last Sunday, in which several British competitors took part, we are pleased to say, on British-made motor cycles. The awakening of French motor cyclists and makers appears to date from the inter-club event between the Motor Cycle Club de Lyon and the North-west London M.C.C., when a British rider and machine won the principal trophy. At the time articles were published in the French motoring and sporting press, and repeated after the Olympia Show, commenting on the advanced condition of the motor cycle industry in this country, and comparing the British and French motor cycles without applying too flattering remarks to the latter.

Without being accused of egotistical remarks, we can also claim to have assisted in this revival through the medium of numerous articles on the French industry which have appeared in our pages, and our criticisms of motor cycles at the Paris show.

Some years ago the French were quite invincible on their racing machines, and the International Cup was only wrested from them by the Austrians after a very keen struggle at Dourdan, not many miles away from last Sunday's hill-climbing competition. The victories gained on road and track were not taken advantage of by the majority of French makers, who expected their clients to be satisfied with the same

description of mount as provided for racing. These machines were practically uncontrollable in ordinary hands, and the French, not finding the same advantages placed before them as the British buying public, did not take to the motor cycle. Such items as free engine clutches and change speed gears are even now practically unknown in France, and when the North-west London men were over last summer the Lyons riders were very much impressed with the clutch starting of some of the machines belonging to members of the party.

There is no reason why the pastime should not become as popular in France as it is here, if the French makers resolve, as we believe they have already done, to put on the market reasonably quiet, controllable, and comfortable machines, provided with those adjuncts to reliability and cleanliness which have caused our British-made mounts to be in demand by French riders, even in face of the stiff tariff which renders their export to France almost prohibitive.

The above remarks do not apply, of course, to one or two French firms having agents in this country, who have succeeded in getting them to see the error of their ways.

However, a handful of French makers have had the courage of their convictions, and adhered steadily to the industry, with the result that we hope they will reap the benefit of their persistence in pushing a type of motor which many motor cycle makers abandoned, either in favour of cars both large and small or other engineering goods. We offer our congratulations to the two French clubs who have had the courage, in face of some opposition and difficulty, to run the two events referred to above.

ENGLISH-DUTCH RELIABILITY TRIAL.

Regulations governing an International Team Trial to be held next August.

WE have already announced that the Dutch Motor Cycle Club, or to use its proper name, the Nederlandsche Motorwielrijders Vereeniging, will next year organise the first of a series of international reliability trials, the date for the 1912 event being fixed for August Bank Holiday Monday. We have received from Mr. A. Citroen, the hon. sec. of the Dutch body, an outline of the rules which will govern the trial. The event is open to English and Dutch motor cyclists, but not more than twelve entries will be accepted from each country. These twelve representatives will be composed of six trade riders and six private owners, and all must ride touring machines, equipped with an efficient motor cycle lamp and generator, at least one tool-bag, two efficient brakes, mudguards, stand, carrier, a loud-toned horn, and silencer. Dropped handle-bars are strictly forbidden, also the use of a cut-out. Trade riders will pay an entry fee of £1; private owners may compete without charge.

Distance and Route.

The distance of the trial is approximately 160 miles, and the start will be made at 8 a.m. from Amsterdam. The route is *viâ* Soestdyk to Apeldoorn (luncheon stop) and "The Grebbe"—the only really severe hill on the course—at the foot of which tea will be taken. Any competitor who fails to climb the Grebbe, or who assists with his feet in any manner, will be penalised to the extent of five marks. For every minute early or late at controls one mark will be deducted. The finish of the trial is at 7 p.m., and as lighting-up time is not until 8.30 any riders who are delayed need not trouble to light their lamps. The control will be closed at 8 p.m. All competitors who finish the trial within schedule time will be awarded a silver medal, whilst a bronze medal will be presented to the entrant whose total errors in time do not amount to more than twenty minutes. The running is calculated on the basis of nineteen miles per hour. Competitors will start in pairs, viz., one Dutch and one English rider, at intervals of one minute, so that there will be no advantage to the Dutch riders in knowing the route, and they will in this manner be able to assist their English *confrères*. The Dutch M.C.C. proposes to select its team in the following manner: Three places are being kept open for the three leading Dutch motor cycle manufacturers, and for the other three the club will invite entries and decide upon the actual team nearer the date. Private owners will be divided into three sections:

- A.—Machines with a maximum capacity of 340 c.c.
- B.—For machines with a maximum capacity of 500 c.c., with or without sidecar.
- C.—For machines with a capacity of 500 to 1,000 c.c., with or without sidecar.

Entries are being invited from all the members, and, as in the trade class, the actual riders to represent their country will be determined in good time. The trial is in the nature of a regular running contest, and, although adjustments and replacements will not disqualify, nothing whatever may be touched during the luncheon and tea controls. The winning country

will be the one whose team loses the least aggregate number of marks.

Four Days in Holland.

Mr. Citroen recommends an enjoyable week-end for the British participants as follows: Start from Harwich on August 3rd on the night boat arriving at the Hook of Holland at 6 o'clock next morning. Two members of the Dutch M.C.C. Committee and the hon. secretary will be at the landing stage, and will conduct the English party to the Hague (eleven to twelve miles), where breakfast will be taken. After a short visit to the Hague the celebrated bathing place, Scheveningen, will be visited, whence, at 4 p.m., the ride will be continued to Amsterdam *viâ* Haarlem. Here the Dutch M.C.C. has kindly offered to arrange garage and hotel accommodation. The trial proper commences at 8 a.m., Monday, August 5th, finishing at 7 p.m. Next morning Volendam, that well-known fishing town, will be visited. Here luncheon will be taken, the competitors afterwards returning to Amsterdam, and further *viâ* Haarlem to the Hague again, or, if preferred, from Volendam to Zaandam, the country of the windmills, then to Velsen, Haarlem, and the Hague. Dinner will be taken here, and at 7.30 p.m. a start will be made for the Hook of Holland, where no time must be lost in getting the machines on the steamer. The Dutch M.C.C. recommends the Great Eastern Line, starting from the Hook at 11 p.m. The total cost of the trip will be about £5, depending upon the riders' personal inclinations. *The Motor Cycle* has been requested to act as the intermediary of the Dutch M.C.C. in this country, and we shall be willing to receive entries for the trial on the Dutch club's behalf. Entries from experienced British motor cyclists owning reliable machines may be forwarded at any time, trade entries to be accompanied by a fee of £1, as stated above. Each member of the British team should have at least three non-stop runs in observed trials to his credit.

The Dutch M.C.C. will award a special prize to lady motor cyclists who complete the course and arrive at the different controls within schedule time.

Motor cyclists who send in their names to compose one of the team, and are not chosen, are invited to accompany the English competitors on the trial, although they will not be allowed to take part in the actual competition.

NEDERLANDSCHE MOTORWIELRIJDERS VEREENIGING.

Goedgekeurd bij Kon. Besluit van 2 November 1904, No. 37

Amsterdam, 1911
Kalkersstraat 1.

*For the Motor Cycle
(Christmas - number)
The members of the Dutch M.C.C. Club,
who, last summer, paid a visit to
the Island of Man, wish all their
English motorcyclists a merry
Xmas and a Happy New Year and
sincerely hope to meet them again in
August 1912, on occasion of the
English-Dutch Reliability Trial*

THE DUTCH MOTOR CYCLE CLUB'S CHRISTMAS WISHES TO
BRITISH RIDERS.

HIS WAY OF LOOKING AT IT.

Angus : Grand thing, these motor bikes, Donald.

Donald : Aye, Mon, but I'm thinking it 'ud be a bit draughty wi' a kilt, the noo.

MY SENSATIONAL CHRISTMAS!

For obvious reasons our contributor describes certain persons and localities with considerable vagueness in the following article. Certain things happen from time to time in this country which for international reasons are carefully kept out of the papers.

TIME heals all wounds, and I have the permission of very high authorities to seek tardy publication for the thrilling experiences detailed in the following narrative. They befell me one day in Christmas week, 1910. I may explain at the outset that I am a very humdrum individual, employed in a City bank, and that I am a bachelor. On the very rare occasions when I take a brief holiday, I invariably spend it on my motor cycle. This will explain why I was found on the road at a period of the year when most motor cycles are rusting in their sheds, and more fortunate owners than myself are basking at their firesides in the bosoms of their families. I live in lodgings, I have neither kith nor kin, and except for an annual fortnight in August my leisure seldom permits of long rides.

A Trip Up North.

Last Christmas, as readers will remember, the roads were frozen hard and smooth, and the sun shone warmly for eight hours a day or thereabouts. I may have been rash, but, as I had never toured in Scotland, I chose this rigorous season for a trip North. The ride to Edinburgh occupied two days, and was accomplished in tolerable comfort. The going was good, though the wind was abominably cold except at midday when the sun was strong enough to temper the bite in the atmosphere.

On the third day of my brief leave the wind dropped, and, as is usual on a calm day with the thermometer below freezing point, a thick fog soon descended, and blotted out the landscape.

I dare not divulge the exact locality in which I was riding. Suffice it to say that I was well north of Edinburgh, and was crossing a low range of hills not far removed from the coast. Circulation had long since ceased in my lower limbs, and nothing but the difficulty of restarting my machine on a rising grade had prevented my dismounting to stamp some semblance of a glow into my chilled feet. As I breasted the shoulder of a dumpy range, a rift in the fog proved that I had attained the summit, and with a sigh of satisfaction I was preparing to dismount and give myself a cabman's hug when, to my intense surprise, I sighted a powerful N.S.U. twin with a sidecar attached, reposing close to the ditch.

A Guttural Voice hailed me.

The prospect of company during my stoppage was attractive, but for a moment I could see no signs of a human being. I had already got my machine on its stand, when a guttural voice hailed me, and I saw the owner of the sidecar outfit regarding me from over the wall. He vaulted nimbly over the low mortarless wall, and revealed himself as a pleasant-looking

young foreigner of about my own age, with a heavy moustache. He spoke English excellently, though his gutturals provided absolute proof of his nationality. We exchanged smokes, and chatted in true comrade fashion about motoring matters. He was evidently an expert, and gave me two or three invaluable hints with regard to the N.S.U. gear. I happen to have this gear fitted to my own English roadster.

In the course of our conversation I began to be rather puzzled. His manner was contradictory. On the one hand, he evidently desired to be cordial and friendly. He offered me some excellent cherry brandy from his flask, pressed a cigar on me, and when I admired its flavour he insisted on my accepting two or three more. He even presented me with a most ingenious little tool of his own design and construction, which was most useful for making sundry adjustments to the gear.

On the other hand, he was equally anxious to be rid of me. He spoke of the extreme cold, exaggerated the distance to my destination for the night (of which I had informed him), and finally got quite brusque and rude when I suggested that we should join company for a few miles. At first he said he had to be in Edinburgh by tea-time, but when I offered to return there with him, as I was tired of the cold and the fog, he grew positively abusive, and said his plans were not at all definite. In fact, he seemed quite angry and suspicious, as if he fancied I intended to sandbag and rob him. I am the last man to press my company where it is unwelcome, and before long I drew on my gloves and prepared to proceed north and be quit of this surly companion.

A Glimpse of Red over the Low Wall.

As my valve dropped and the engine fired, I thought I caught a gleam of red over the low wall, and the curious object I sighted through the low wreaths of mist looked remarkably like a pile of red petrol cans, with two or three spars lying across them. However, the circumstance scarcely excited my curiosity at the moment, for I was exercised about the German's curious manners, and was wondering whether such a burly and soldierly individual could really be fearing personal violence from a scrubby little undersized bank clerk like myself.

These surmises soon merged into more urgent attention to the road, for its twists and gradients were very baffling in the thick fog. I had travelled as nearly as I could say some five or six miles from the scene of the meeting place, when my loneliness was removed by the sound of a distant exhaust. At first I mistook the sound for the low hoarse call of some moorland bird crying to its mate; but my

My Sensational Christmas.—

motorist's instinct was not long to be deceived, and I presently recognised it for the raucous crackle of a multi-cylinder engine being run rather slowly on the open exhaust.

My mechanical instincts were swiftly alert, and two things puzzled me extremely. The first was the intermittency of the crackling. It came in fits and starts, resembling the dot and carry one of a powerful motor cycle driven on the valve lifter by a timid rider; and one knows that powerful six-cylinder racing cars are not driven in this fashion. At first I thought the engine was missing badly, but careful listening discarded the suggestion; either the engine was being frequently cut out on the switch, or else the cut-out was being opened and closed in truly crazy fashion.

Then again I could form no estimate as to the whereabouts of the mysterious car. I could not decide whether it was behind me or in front of me, overtaking me or approaching me dead on. Offhand I should have guessed that it was on a parallel road not more than 800 feet away, but I knew there was no other road anywhere at hand in this desolate moorland district, and, even if there had been, my ear could not have decided whether the queerly-driven engine was on my right or left.

The Strange Noise Dies Away.

Finally, the sound died away altogether, and I drove on in distinct confusion, wondering whether I had been the victim of some strange hallucination, or whether I had been deluded by some weird multiplex echo. Some peculiar formation of the hills, I finally decided, had caught the beat of my own noisy engine, which had ricocheted back, multiplied five or six times in fainter cadences. I was sharply and unpleasantly aroused from these speculations into stern reality.

Fancying I had the road to myself, I took a corner a trifle faster than I dare have done in summer, and much faster than I ought to have ventured in the fog. The highway curled round to the right, hugging a long shoulder of moss-grown crag, and as I swept round I encountered head-on a gigantic car tearing up the easy slope at over fifty miles an hour. I caught my breath, spied for one frightful second a white, strained face snatching madly at the steering wheel, and then I was past.

On went my Brakes

and I was out of the saddle in a moment. The splendid car—a magnificent Rolls-Royce—in its frenzied swerve to avoid me, had charged the rock wall on my right, and its bows were a crushed mass of bent and splintered metal. All its wheels had been torn clean off by the impact and strain, and it lay drunkenly half over on its side against the wall of rock, its occupants strewn across the road to the left, each in a queer distorted heap. In my distress I barely noticed that its crew consisted of two naval officers and three blue-

jackets. The driver was dead, lying crushed behind the damaged steering wheel. The three tars were spread in the road, struggling to rise, but so badly injured that they had no command of their limbs. The fifth passenger was evidently an elderly officer of exalted rank in his mess tunic, over which a rich fur cloak seemed to have been hastily flung; and, strangest of all, out there on the lonely road lay a bent and buckled machine gun, distorted by its impact with the frozen road.

I pulled out my flask of "Three Star," and bent over the officer, whose head was cut and bleeding, and from whose lips was proceeding a stream of that special profanity of which the navy is credited with the monopoly. But he had his wits about him. "In the King's name, young fellow," he gasped, spitting blood and teeth from his mouth; "never mind us! A — German aeroplane's been over our new naval base at R— while we were at lunch, and has photo-

"As I swept round I encountered head-on a gigantic car. . . . I caught my breath, spied for one frightful second a white, strained face snatching madly at the steering wheel, and then I was past."

graphed all the works. They are heading south towards Edinburgh; tanks must be nearly empty if they've come over the sea; secret stores on the hills seven miles off, probably. After 'em; raise the countryside on them! If they get those plates home, we're done!"

Armed with Service Revolvers.

One of the tars was on his legs by this time, and, thrusting a brace of automatic revolvers into the pockets of my leather coat, he shoved me towards my machine.

"After 'em, sir!" he spluttered, eagerly. "Mark 'em down when they land for petrol. "There's help coming. We were the first car after them. There's lots of help coming along!"

I mounted, getting the engine off first time by a gigantic heave, and, as I roared uphill through the fog

My Sensational Christmas.—

on full spark and throttle, my scattered wits began to collect themselves. The mysterious noise was explained—I ought to have recognised it at once, for I had heard the Gnome engine at Bournemouth during a whole week in the summer.

My strange acquaintance, the N.S.U. rider, was obviously on the look-out for the spying aeroplane, with a supply of petrol and a few spare parts; probably there were other German riders out on the hills, too.

Steering by compass, the aeroplane had slipped quietly across the North Sea in the calm and fog, hoping to achieve a task which precautions render impossible in ordinary weather, and to return to Germany, leaving England unconscious that her closely-guarded naval secrets were common property in Berlin. I am never a timid rider, but, my word! I shirked no risks in that dare-devil sprint through the mist. I drove as if I had Brooklands track to

just below the summit, and lifted my valve. Hiding my machine in the ditch, I ran up the road, keeping close to the wall and stooping furtively. As I approached the plateau, I saw the twin and sidecar just where it had been threequarters of an hour before, but there was no sign of its owner or of the aeroplane.

Lifting my head cautiously, I peered over the wall, and, thinking I heard voices out on the moor, I edged further and further up towards the derelict sidecar. The fog was thick, but as I drew nearer the summit certain indistinct lines, dimly sighted through it, took shape and definiteness. At last all was plain. There lay the huge aeroplane amid the stones which were scattered over the rank brown moor-grass, no longer graceful, but like some crippled dragon-fly, one wing hopelessly buckled by a foul landing. Twenty yards nearer was a stack of petrol cans, and a group of three men, excitedly chattering in German.

One of the men was my acquaintance of the forenoon; the other two, heavily swathed in furs and aviation helmets, were obviously the two intrepid pilots of the damaged aeroplane. Even as I gazed, their plans evidently took shape. One of the aeronauts clambered hurriedly up into the boat-shaped body of his machine, and extracted a small black oblong case; even the fog could not prevent me from recognising a folding camera. He thrust this into the hands of my acquaintance, with emphatic orders and gesticulations.

My friend of the forenoon stowed it hastily in an inside pocket, and, waving a reassuring message to the airmen, turned his back on them, and ran for the sidecar. I kept my head over the wall long enough to see the two airmen disappear into the fog, abandoning their useless plane, and then I lay down in the ditch. I heard the German motor cyclist vault heavily over the wall, haul his machine round with its nose towards Edinburgh, and spend a moment or two, turning on taps no doubt. I occupied the brief interval in pulling out one of the Mauser pistols the sailor had given me, and as soon as the echo of the exhaust broke on the soundless air I slipped back to my own machine, and, with cut-out closed, headed hard after him.

A Stern Chase in the Fog.

The German's machine was being driven fairly fast on the open exhaust, and by keeping my silencer shut I was able to ride within earshot in the fog without his being aware of my proximity. In this way we covered perhaps a couple of miles, and then, with never a hoot from behind, a Prince Henry type of Vauxhall racer drew silently up to my shoulder in the mist. It was manned by naval officers, and the admiral I had already seen was in the rear body. They slowed down, and I gave them all my information without dropping below twenty-five miles an hour. "Hang on to us," said the sporting young lieutenant at the wheel; then bang went his foot down on his accelerator, and we simply fell off the hills into the fog of the valley below. There was some pretty shooting when we caught up my friend with the sidecar. The sailors perforated his back tyre, and mangled his rear frame and mudguards and carrier into bent iron work with revolver bullets, before he stopped, and then he only stopped because a

"The fog was thick. . . . There lay the huge aeroplane . . . no longer graceful, but like some crippled dragon fly, one wing hopelessly buckled by a foul landing."

myself for an hour record, and a strange exultation glowed in me as I saw that I, who pass for a dull humdrum clerk in City circles, had a distinct chance of dying for my country, and of making my name famous wherever the British National Anthem is sung.

The faithful speedometer told me when five miles of the return journey towards the ridge-summit had been covered, and I thought it wise to close my cut-out, so that I might approach the summit silently if the giant plane had sunk to rest on the top of the moor.

Spying out the German Aeroplane.

The dial on my handle-bar registered the sixth mile from the point where I had left the disabled car, and then it began to tick off the tenths of the seventh and last mile. I recognised the sharp corner

My Sensational Christmas.—

broken chain stay and a flat tyre sent him swerving into the ditch. The bluejackets were on him in an instant like tiger cats, and his camera was waved aloft in triumph. They had the spy lashed up like a mummy in two minutes, and when another car came up he was sent back in it to R—to await his trial.

I never heard his fate, and only know that this aspect of the affair, like many secret service matters, never got into the papers. For myself, I can only add that the admiral and the young officers on the Vauxhall stood me a royal feed at the Carlton in Edinburgh that night, and made me swear to keep my mouth shut—a promise from which I have only just obtained a partial release.

How I kept the Secret.

When I reappeared at the office, I answered queries as to what sort of Christmas I'd spent with a grumpy reticence, and my fellow clerks have no notion that I am the man who saved England.

Perhaps the sternest test I faced over the matter was when all London was mystified by certain newspaper paragraphs early last January, referring to a bad motor smash in which certain naval officers were involved, and to the towing of a damaged aeroplane into Edinburgh for repairs. I think both were commonly ascribed to over-indulgence in the wassail bowl; I know the son of a Scotch cotton millionaire was freely accused of taking his initial flight on a racing Blériot when overfull of champagne. But I managed to hold my tongue through it all. X.Y.Z.

OCCASIONAL COMMENTS.

By "IXION."

Tricars and Light Cars.

A correspondent of *The Scotsman* remarks that he was unfavourably impressed with the three-wheeled carrettes exhibited at Olympia. His criticism consists of vague generalities, but, when analysed, resolves itself into two assertions:

1. Carrette designers proceed on the assumption that small car design is all wrong, and attempt to improve on it.

2. The ideal of a cheap, light, *fast* motor is impracticable.

The first of these contentions is ridiculous nonsense. Nobody questions the fact that a 6 h.p. Rover, to mention an actual sample, is about as fine a compromise as is possible, considering the nature of the demand which has to be met, and the sum of money available for the purpose. The carrette designer faces a demand for a much speedier vehicle at less than two-thirds of the price. He does not criticise small car design; it does not affect him any more than aeroplane design. He is faced by a totally distinct proposition.

As regards his second contention, our gloomy critic has a better case. For five years past the trade has been endeavouring to produce a carrette to sell at £85 or so, which shall be as reliable and as economical in unkeep as a 6 h.p. car, besides being 30% faster and weighing about half as much. It cannot be pretended that the trade has as yet solved this problem. Scores of designs have been marketed and sold, but up-to-date none of them has established a very eminent position.

This year, among others, the Morgan runabouts, the A.C. sociables, and various sidecar outfits sold in tolerable numbers, without any single pattern achieving the popularity of a first grade motor bicycle.

Personally, I regard these compromise vehicles as being less fully evolved than the motor bicycle or the small car, but I see no reason why the fittest should not survive and secure a wide and remunerative niche in our market. It is some years since I owned a sample of the type in question, but four years ago two or three outstanding representatives were full of promise and well worthy of perseverance.

A slight addition of reliability, and a slight reduction of running costs (and especially of tyre costs), should enable them to hold their own against the second-

hand and new small cars. Hence, I think *The Scotsman's* correspondent may have to eat his words in the near future.

Bowden Wires and their Fitting.

My note on the need of more accurate fitting of Bowden wires has provoked a number of letters, and I should like to emphasise one fact in particular, viz., that whenever a Bowden wire is fitted without a screwed adjuster, its omission is contrary to the Bowden Co.'s instructions. It is impossible to construct either a flexible casing or an internal stranded wire which shall be absolutely inextensible. For instance, whenever the wire is taken round a sharp curve the casing is bound to "gape" a little; its coiled threads separate a trifle, and so the relative lengths of casing and wire are affected, and adjustment immediately becomes essential.

Many riders fancy that the warning against sharp bends in the control is directed against breakage, and when they find the casing does not snap they grow callous about these bends, and twist the control in and out anyhow. The warning is based on the fact that the coils of the casing gape, and the strands of the inner wire bed down differently, around such bends. Control wires that are laid straight or led round easy curves of big radius seldom require adjusting. In addition, the licensees of Bowden Wire, Ltd., are not always fair to the devices they fit. The crucial points of the fitting are three in number, viz.:

1. The proper soldering of the nipples.
2. The inclusion of an adjuster.
3. Exactness in cutting wire and casing of the correct relative or proportional lengths.

These requirements suggest that each factory should have one man or more whose sole duty it shall be to fit, repair, and oversee control wires.

Some makers appear to think that any jugglers armed with a pair of cutting shears and a soldering iron can be trusted with Bowden wires. As a consequence, machines are assembled with the wire and casing of incorrect relative lengths. The tester takes out the completed machine, and has to let out half the adjustment to get the wires to work. The machine comes back, and in many instances the maladjustment is not reported, and the machine is sent out to a luckless customer with only half the adjustment range available.

Lubrication Systems.

Some Examples of Current Practice
on Motor Cycles.

(Continued from page 1365.)

Types of Sight-feed Oilers.

Fig. 1 represents the Best and Lloyd drip feed lubricator, which is used to give constant feed on a large number of machines in which the lubrication system is otherwise ordinary splash. The device consists of a pump with a spring behind the plunger, so that oil is gradually forced through an adjustable drip, giving a visible feed. The pump is contained in an oil tank, on the top of which it is screwed, and differs from the ordinary pump in having its plunger inverted so that it is filled by pressing the rod down instead of, as is more usual, pulling it up. The thumb nut, which operates the needle valve is fitted with a spring ratchet, which enables it to be locked in any position. Also the sight feed can be set at any angle so as to be easily visible to the rider, which is certainly a great convenience.

The Rotherham constant feed lubricator achieves much the same end, though in a different manner. This latter device is shown in figs. 2 and 3, and consists of a drip feed through which oil is driven by pressure. Let into the oil tank is an air pump with an ordinary non-return valve, as shown in fig. 3, and by means

Fig. 1.—Best and Lloyd drip-feed pump.

of this a pressure above atmosphere of about 5 lbs. to the square inch is obtained inside the tank. The Rotherham sight-feed drip arrangement, shown in fig. 2, embodies a small pressure gauge of quite tiny dimensions, which indicates roughly the amount of air pressure in the tank. The dial of this little gauge is marked in three points, and indicates when the pressure is right off, when it is half on, and when it is full on. The drip feed is of the usual visible type, and is furnished with a horizontal needle valve for fine adjustment. The feed pipe is taken through the tank so that the drip feed device is protected from the ill effects of a fall by being on the top of the tank and not at the side. It will be realised that, owing to the comparatively small displacement of oil in the tank, the original pressure is, if there be no leaks, maintained for a considerable time; or, at all events, there is sufficient pressure to maintain a fairly constant flow.

Inspection Windows.

On the F.N. four-cylinder machines the lubrication is of the usual splash type, the feed being by means of a spring-propelled

Fig. 2.—Rotherham adjustable drip-feed and gauge.

Fig. 3.—Rotherham pressure pump.

pump, through the piston rod of which passes a milled-headed adjusting screw. There is no visible drip on the pump itself, but the feed pipe is, when it reaches the engine, branched out into four pipes which enter the crank chamber immediately in front of the series of inspection windows, of which there is one for each cylinder. The flow of oil can, therefore, easily be inspected, though not, of course, while the machine is running.

Fig. 4 is a sketch of the F.N. window in the side of the crank chamber, and shows the situation of the oil pipe which enters from below.

On the Douglas machines the device shown in fig. 5 is used. The inclined hand pump has a spring plunger which forces oil through the adjustable and visible drip feed to the crank chamber through a pipe which passes through the oil tank. The plunger has a cut-off valve and the handle of the rod has to be turned through about a right angle to give the two different positions, viz., for pumping oil from the tank and feeding

Fig. 4.—One of the F.N. crank case windows and feed pipes.

it to the drip. A very good point is that the drip feed can easily be seen whatever the rider's position may be.

An Unusual Method.

The A.C. Sociable has its lubrication device arranged on a quite individual plan, although in this case again lubrication is by splash method, the feed being by constant drip under pressure of gravity. Fig. 6 shows a section of the rear end of the crank chamber, which is cast in one with a box which forms an oil vessel holding a considerable amount of lubricant. The division between the crank chamber and the oil container is a wall which is open at the top. As shown in the section, there is a plunger working inside a tube and uncovering the port which admits oil from the container into the crank chamber proper. This plunger adjustment is made at the works, and should never require any alteration. A simple means, however, is provided whereby additional lubricant can be supplied when necessary. The plunger is carried by a rod working against a spring, and upon pressing a

Fig. 5.—Sight-feed drip on the Douglas.

small pedal the driver can cause this rod to be depressed, so that the position of the plunger, relative to the outlet hole, is altered, and a much larger feed of oil can be given. An ingenious precaution is taken to prevent over-lubrication. The connecting rod carries a scoop on its end which serves not only to direct oil to the big end bearing, but also clears any excess of oil out of the crank chamber by throwing it over the partition wall into the oil container again. This system works extremely well, and is certainly commendable for its extreme simplicity, and—to a limited extent—its automatism.

An automatic oil feed is fitted on the Rex machines, fig. 7 showing the device used. This has a hand-adjustment, and

Lubrication Systems.—

is worked by the vacuum in the crank chamber upon the exhaust and compression strokes of the engine. In addition to splash, oil vapour is conveyed into the combustion chamber by means of a pipe

Fig. 6.—A.C. sump and oil vessel with plunger feed.

which connects the crank chamber to the inlet port. A certain amount of oily vapour is thus drawn in with the charge, and distributed over the cylinder walls.

Excelsior Lubrication.

The new Excelsior engine is provided with an improved system of splash lubrication which should prove very effective. The oil feed from a Best and Lloyd visible drip pump is branched into two pipes, one of which goes directly to the crank chamber, whilst the other is taken to a small lug cast on to the side of the cylinder, as shown in fig. 8, and opening into a port which comes exactly opposite the hollow gudgeon pin when the piston is at the bottom of its stroke. Oil is therefore fed not only to the walls of the piston, but also directly to the gudgeon pin bearing. The other branch pipe is taken to the timing gear case, after leaving which the oil runs on to the main crankshaft bearing, and passes thence inwards to a recess turned in the side of the flywheel, as shown in fig. 9. From this depression oil flows to the crank pin along a

Fig. 7.—Rex sight feed lubricator.

diagonal hole drilled in the crank pin itself to the centre of the big end bearing, being expedited by the action of centrifugal force. Excess of oil from both sources drips into the base of the crank chamber, whence it is sprayed on to the cylinder walls by the connecting rod in the usual way. It should be noted, however, that this lubrication system would operate with practically no oil in the crank chamber at all.

The above is somewhat similar to the system employed in the Blumfield engines. In this case the oil is admitted directly to the timing gear case, whence it passes into the crank chamber through the main bearing bush, the crankshaft having a helical groove cut in it. Additional holes for its passage are drilled in the bush housing, and allow the oil to pass to an undercut annular ring turned in the flywheel, from which centrifugal force propels oil into the hollow crank pin, and so to the big end bearing. In the wall between the timing gear case and the crank chamber proper a large hole is pierced which allows a considerable quantity of the lubricant picked up by the flywheel rims to return to the timing case.

The Combined Method.

One of the most ingenious automatic systems is that on the Scott machine, there being also an auxiliary direct hand pump feed. This hand pump is shown in parts in fig. 10, and consists primarily of an ordinary double-acting plunger pump. The spindle carries a small pin, for the passage of which a nick is cut in the pump cap, and when the pump is not being used for hand operation, the aforesaid pin lies under the cap and keeps the pump plunger down. At the base of the pump

Fig. 8.—Cylinder oil port of 3 1/2 h.p. Excelsior.

is a small mushroom valve kept on its seat by a spring. This little valve is shown enlarged in the sketch, and is secured in position by the cylindrical filter which screws on to the base of the pump. It allows oil to be delivered to each crank chamber through the two branch pipes shown. Adjustment of this needle valve is accomplished very ingeniously. The pump spindle is extended downwards with a rod that just touches the head of the mushroom valve spindle. The cap of the pump is screwed to the cylinder and is provided with a small folding thumb lever, by means of which it can be screwed a short distance up or down. In thus moving, the pump cap carries with it the

Fig. 9.—Arrangement of drilled crank pin and recess in flywheel of Excelsior engine.

plunger rod, and therefore brings about an adjustment in the opening of the mushroom valve. It will be seen that the latter in no way interferes with the use of the pump in the ordinary way. The feed, however, is nominally carried out automatically, in this manner: The engine draws its charge of gas into the crank chamber, but before the ports for this purpose open there is a slight suction inside the crank chamber which is used to draw in a charge of oil. A special packing ring is fitted to maintain a gas-tight joint in the crankshaft bearing, and this has a flat face which is pressed against the side of the outer race carrying the main roller bearings. The packing ring rotates with the crankshaft, and is held up to its work by a spring, as shown in fig. 11. In the face of the roller bearing race is a hole, opposite which, once in every revolution, comes a nick in the packing ring, thus throwing the hole open to the suction of the crank chamber. This hole is in direct communication with the oil feed pipe, and thus at every revolution a small quantity of oil is drawn into the crank chamber.

Fig. 10.—Hand pump and adjustable valve on the Scott engine.

Another Two-stroke Lubrication.

On the Levis two-stroke machines care has been taken to keep the crank chamber

Fig. 11.—Scott lubricating device.

as clear as possible from oil, this resulting in a clean mixture and considerable freedom from overheating, to which most air-cooled, two-stroke engines are admittedly somewhat subject. Oil from an adjustable gravity drip feed is taken to the side of the cylinder, where it passes through a port which comes opposite the gudgeon pin at about half-stroke. The gudgeon pin is hollow, and conducts the oil to its bearings. Most of the oil, of course, feeds to the sides of the piston and cylinder walls. The excess of lubrication from this source, however, does not fall down into the crank chamber, but is arrested by a groove or gutter machined in the baffle between the cylinder and the crank chamber. This gutter collects all the oil that drips from, or is thrown off, the piston, and takes it to the main bearing on the open side of the engine, whence it flows through the hollow crankshaft to the other main bearing, and also to the big end.

Lubrication Systems.—

Mechanical Lubrication.

On four machines shown at Olympia a mechanical feed was fitted. The arrangement on the Indian is already well known. In addition to an auxiliary hand pump there is a worm-driven, direct-acting plunger pump driven from the crankshaft, which draws oil from the tank and delivers it through two branches, at the union of which is an adjustable needle valve. A prime adjustment of the feed is also provided by altering the throw of the mechanical pump. One of these branches proceeds to the timing gear case, whence oil flows into the crank case and is splashed in the usual way. The other branch is taken direct to a port on the back wall of the front cylinder. The whole arrangement is very simple and reliable, and the adjustment such as gives very wide limits to the oil feeds either to the front cylinder or to the crank case.

In the Veloce engine, which was certainly one of the best designed little units to be seen at Olympia, the lubrication system was extremely complete. The rotary oil pump used on this engine is shown in fig. 12, and is carried on an extension of the magneto timing wheel. This pump is of the double-bladed eccentric type, and throws a very large volume of oil, which it draws from a deep sump under the

Fig. 12.—Oil pump of Veloce engine.

crank chamber, the feed pipe for this purpose being fitted below a large filter. The oil is then delivered to an indicator, which consists of a small piston, the rod of which is taken vertically upwards and extended above the petrol tank, thus forming an effective tell-tale. At the same time, this plunger acts as a safety release, for as soon as a certain pressure is reached the plunger passes a hole cut in the side of its guide, and through this hole oil is directly returned into the sump. Under normal conditions this hole is closed by the indicator plunger, and in these circumstances oil is forced through a duct drilled in the side of the crank chamber to the main gearshaft, which also acts as the camshaft. This gearshaft is hollow, and is drilled transversely so that the gear clutches, pinions, and cams are effectively lubricated, whilst a hole in the cam is so arranged that oil is sprayed therefrom and is collected by a scoop fixed to the end of the connecting rod, thus lubricating the big end and also, by splash, the cylinder walls and the gudgeon pin. The sump in the base of the crank chamber is of sufficient capacity to do away with the necessity for an oil tank, and it is furnished with a glass window through which the height of oil therein can be seen. The gear box is

contained within a casing separate from the crank chamber, which is kept always supplied with oil, so that the gear pinions and clutches run in an oil bath.

A New Machine.

The W.D. motor cycle, which made its first public appearance at the Show, is furnished with a very complete forced feed system which operates as follows:

Fig. 13.—The W.D. oil pressure gauge.

The crank chamber is cast in one with a large oil sump holding sufficient for about 200 miles. In the base of this sump is an Albany type pump, which is driven by skew gearing from an extension of the timing pinions. From this pump oil, after passing through a filter, proceeds to an adjustable regulator fitted with a by-pass valve, so that the feed of oil to the various bearings can be adjusted with great nicety. From this point the oil is directed through leads drilled in the crank chamber walls to the two main bearings of the crankshaft. One of the crankshaft halves is hollow and is furnished with a duct communicating with the big end bearing, the crank pin being also drilled. The connecting rod, instead of being hollow, is fitted with a pipe which effects a connection between the big end and the gudgeon pin bearings. On the pulley side of the engine leakage of oil from the crankshaft bearing is prevented by an oil ring which collects any excess of lubricant and throws it into a gutter, whence it is free to return to the sump. After leaving the gudgeon pin the oil falls on to the flywheels, and is thrown on to the cylinder walls, but not by the ordinary splash system, as the flywheels are well above the oil level of the sump. An auxiliary oil tank is carried behind the saddle tube, and is fitted with a pump by means of which the sump can be replenished.

On the Wooler two-stroke engine the

Fig. 14.—Arrangement of oil pump and sump window on the Wooler engine.

lubrication system is as follows: A direct acting plunger pump is screwed to the side of the crank chamber, and is worked by a cam on the crankshaft. This pump

draws its oil from a deep sump forming the bottom of the crank chamber, and forces it through ducts cast in the crank chamber walls to the piston and the hollow gudgeon pin, which, contrary to usual practice, is loose in the piston, and is made fast with the ends of the forked connecting rods. Another branch of the main oil pipe is led to such a position that it discharges oil directly on to the big end, when the piston is at its rearmost dead centre. The big end is cast with a cup which collects this oil and ensures its getting to the crank pin.

The Puch machine has its lubrication arrangements on similar lines to those on the Indian. A direct acting plunger pump draws from the tank and delivers to the crank chamber in which there is a circular window so that the level of the oil can easily be seen. This oil pump is driven by a worm gear formed on an extension of the skew gear driven camshaft, which also drives the magneto and forms a very compact and interesting mechanism, as shown in the sketch (fig. 15).

Fig. 15.—Puch mechanical oil pump.

NEXT WEEK'S WINTER TRIALS.

Competitions arranged for next week are almost as numerous as during the summer months. The programme is as follows:

Tuesday and Wednesday, December 26th and 27th.—The M.C.C. winter reliability run to Exeter and back, starting from the Bulstrode Hotel, adjoining Heston-Hounslow Station, at 7 p.m.

Wednesday, December 27th.—The Birmingham M.C.C. open reliability trial to York and back, starting from Corporation Street, Birmingham, at 9 a.m.

Wednesday, December 27th.—Sheffield and Hallamshire M.C. run to Bridlington and back, starting from the Town Hall, Sheffield, on Tuesday at midnight.

Wednesday, December 27th.—Harrogate and District M.C.C. trial over the Spring Quarterly Trials course (146 miles).

Saturday, December 30th.—The North West London M.C.C. open twelve hours' reliability run to Gloucester and back, starting from Jack Straw's Castle, Hampstead Heath, at 7.15 a.m.

Saturday, December 30th.—Coventry and Warwickshire M.C. run to Dunchurch, starting from the railway bridge, London Road, at 3 p.m.

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Saddles and Side-slip.

[6153].—In discussing the prevention of side-slipping it is often pointed out that wide handle-bars give the rider increased power to hold up his machine on greasy roads. In my opinion the breadth and lateral rigidity of saddles has also a marked influence in this direction. It should be a simple matter to hinge the front end of the saddle in a manner that would prevent twisting.

B. GRIMWOOD.

Are Provincial Shows Wanted?

[6154].—I was glad to see letter No. 6090, and, like many hundreds more, would welcome a Show in the North.

There are many who, even if they could afford the ordinary return fare to London, could not get away for the time necessary to see the Olympia Show. The only excursion from St. Helens was a two-day one, leaving early on Monday morning, and that was not even advertised by the railway company.

There are enough interested people in Liverpool and Manchester alone to make a success of a show, but if held in Manchester it would be more available for the Eastern Counties.

LANCASTRIAN.

[6155].—Why cannot manufacturers see their way to hold a show of motor cycles in the North? I feel sure it would prove profitable to them, despite its expense. If it pays car manufacturers to hold a show in Manchester, it should doubly pay motor cycle makers, for as a body motor cyclists are not so wealthy nor have as much time as those who own cars. There are thousands in the North who had no possible chance of attending the Show at Olympia. I saw in your valuable paper that quite a number of firms were crushed out at Olympia for want of space. I feel sure that if manufacturers would only give it a trial—if only once—they would find the results astonishing. Though one hears of about six or seven firms being booked up for next season, this is all the better—there is a chance for others, who I wish would try and get us a show up in the North.

C. B. ROBINSON.

Straying Cattle.

[6156].—The short paragraph in last week's issue on the straying cattle problem reminds me of a method I put to the test a few weeks ago, and I feel sure if other motor cyclists try the same remedy for straying horses they will get much more satisfaction than any they are likely to squeeze out of the High Court.

Of course, down here (Devonshire) we get a lot of strange stragglers on the high road, and one afternoon I was stopped on a hill by two horses, evidently dissatisfied with the pastures allotted them. However, by the time I had started again, and on the first few explosions of the engine, the horses tore on ahead.

Being rather sick of my enforced halt, I gathered up speed, and kept them at it until we came to a side road, which luckily they took.

Those horses were left at least six miles from where they started, a farewell "honk" on the exhaust whistle sending them on a Devonshire lane.

I hope the owner enjoyed his walk. He does not seem to be desirous of taking any more exercise, for when I last passed the horses they were standing the other side of a 5ft. barbed wire fence. Good luck to him!

[We cannot altogether approve of this method, as damage might be done to a valuable horse for which motorists could be held responsible.—Ed.]

Winter Mudguarding.

[6157].—May I beg a little space in your columns to reply to "M.D." [letter 6151]. In the first place "M.D." makes a general statement that the present motor cycle cannot be ridden for ten minutes without making its rider covered with mud. He next says that he rides his machine all weathers, but has to wear so-called petticoats to keep clean. Finally, he complains of belt slipping. The first two statements I can answer in one reply. I have ridden a motor cycle for several years, but for the last two I have owned a Scott. This machine is so efficiently guarded that I ride in all kinds of weather with absolutely no extra motor clothing on except a top coat. My boots and trouser ends seldom get more than a few spots of mud, which can be brushed off one's boots on a door mat, leaving the rider clean enough for an afternoon tea party. The third complaint is simple to answer. The Scott machines have a well-guarded chain drive.

"M.D." then gives a definition of a motor cycle up to his ideals. Might I ask if he attended the Show? Again, might I ask if he saw the Scott? MUDGUARDED.

Pillion Seats.

[6158].—Being an interested reader of your valuable journal, and noticing recent photographs of married couples who cycle, I am sending photograph of how my fiancée and myself ride about on my 1911 F.E. Triumph. I have a neat seat fitted with footboard on the carrier with rail fitted round, which makes a very comfortable seat, and it is really surprising how the little machine will travel with

our combined twenty-two stones up. I use this machine for business and pleasure in all weathers, and as I am a traveller it gets many a gruelling. The F.E. clutch I find a great help and simply perfect in action.

TOM SNOOK.

Space at the Show.

[6159].—A correspondent in your last issue, signing himself "An Intending Exhibitor," complains of the amount of room occupied at the Olympia Show by the offices of big manufacturers, and of the size of their stands. There is, no doubt, a good deal of truth in what he says. But what seems to me even more unjustifiable is the fact that valuable space is allotted to certain vendors of goods which have nothing to do with a motor cycle show.

(REV.) F. R. J. EASTON.

[We understand that the spaces referred to were let on the understanding that motor cycle or cycle goods were to be exhibited, and we are led to believe that the same sort of thing will not occur again.—Ed.]

Proposed Abolition of the Cut-out.

[6160].—With regard to the question of silencers and cut-outs, it seems to be taken as a foregone conclusion that a silencer which is sufficiently closed up to render the machine really quiet must necessarily affect its efficiency. Whilst it is not a question entirely of size, there is no doubt that the majority of machines on the road to-day are fitted with silencers which are very much too small for the power of the engine, and therefore cut-outs are necessary. The cut-out is, however, undoubtedly the cause of the prejudice with which the average person regards the motor cycle, and there is not the slightest reason why a machine should not be equipped with a silencer which renders the machine unobjectionable to other users of the road without in any way impairing its efficiency.

Although we have been manufacturing motor cycles for eleven years, we have never yet supplied a machine to the public, fitted with a cut-out, and we have many instances of machines being driven both with and without sidecars for twenty miles on a 9 to 1 gear without the slightest symptoms of overheating.

PHELON AND MOORE, LTD.

Ladies and the Motor Cycle.

[6161].—I enclose photograph of myself and my 2 h.p. Moto-Réve. I am the only lady motor cyclist in this district, though I believe there is one other in Lincolnshire. I began motor cycling last May, and enjoy it immensely. I have ridden many miles, but have never seen another lady motor

cyclist, though I have no doubt many more will join the ranks before another season. If only they knew how simple it was!
Sutton Bridge, Lincs. (Miss) AGNES S. HOBSON.

Multi-pole Sparking Plugs.

[6162].—With reference to the letter [No. 6139] signed E. P. Thomas, in your last issue, the suggestion he makes is a perfectly feasible one, and a double-pole plug can be made with parallel poles as shown by his diagram, but in order to obtain sufficient insulation between the two poles it is, unfortunately, impossible to construct such a plug to fit the ordinary standard plug thread.

In your footnote to Mr. Thomas's letter you mention the possibility of using a double spark magneto, but there is really no need to go to the expense of this, as precisely the same result can be obtained with an ordinary magneto and a double-pole plug. We have on the market a well-known patent double-pole plug which is used in exactly the same way as your correspondent describes, two sparks being obtained at precisely the same moment at two different places in the cylinder from the one magneto. The insulation difficulty is overcome by utilising pole pieces and insulators of concentric construction; and thus the Lodge double-pole plug is made with the ordinary standard plug thread, and fits every engine.

LODGE BROS. AND CO.

[The Lodge system was described and illustrated on March 14th, 1910.—Ed.]

Single-cylinder Machines and Sidecars.

[6163].—"T. 1,111" has read more into my editorially-abbreviated letter than I intended. What I inferred was that a $3\frac{1}{2}$ h.p. (so called) is not nearly as satisfactory for sidecar work as a good 5-6 h.p. twin. The $3\frac{1}{2}$ h.p. cannot possibly be equal. If geared "up" to equal speed, it cannot climb equally. If geared "down" to climb equally, it cannot equal speed.

Put the twin in the hands of the ultra-expert $3\frac{1}{2}$ h.p. man, and he could of course easily beat his own $3\frac{1}{2}$ h.p. performances. Hill-climbing is a question of work, power, time, and resolves mainly into one of gear ratio. Sutton Bank has been climbed by $3\frac{1}{2}$ h.p. with sidecar and passenger, and could be climbed by $1\frac{1}{2}$ h.p. with sidecar and passenger if geared low enough.

Re route 746. I certainly do not think the average $3\frac{1}{2}$ h.p. capable of traversing the route with sidecar and passenger, even on a much lower than ordinary touring gear. On the other hand, I by no means say the route is an impossible one. However, if "T. 1,111" or others are going that way I should be most pleased to accompany them, and hope they will drop me a line c/o. the Editor.

H.P.B.

M.C.C. Winter Run.

[6164].—As there was a considerable amount of unnecessary inconvenience caused to many taking part in this run last year may I address a few remarks to those who are competing this year. First, with reference to the night portion of the ride. It is very disconcerting to have another competitor riding close up behind, especially if his lamp is a very powerful one. Apart from this, there is considerable danger to both in case the front rider suffers a skid. If you are overtaking another competitor and wish to pass do so as soon as possible, but do not attempt it when negotiating curves. After passing keep on at the same pace as when overtaking; at least until you have a substantial lead. There is only one thing as bad as riding on a man's back wheel, and that is to keep just in front of him.

Will the drivers of sidecars please remember that the solo riders have a rough time of it in grease? It is up to them to give as much room as possible and not cut in immediately after passing, as was so frequently done last year.

If you have to do anything to the machine, get it right off the road and do not turn the machine round so that the light shines in the faces of approaching competitors.

At the controls at Salisbury and Exeter the early starters should turn their machines round and keep them near the entrance, to avoid having to back out through the later arrivals.

Lastly, study the route cards and map carefully, and with these few hints things should run a good deal smoother than they did last year. Don't ride fast where loose stones are about.

HAROLD KARSLAKE.

Sunrising Hill and $3\frac{1}{2}$ h.p. Sidecars.

[6165].—Re "Observant's" letter in last week's issue with regard to the above.

As an eye witness I can vouch for the fact that H. G. Dixon, driving a $3\frac{1}{2}$ h.p. New Hudson and sidecar, ascended

Sunrising Hill in the recent Midland trial on the second round unaided, but he walked alongside the machine for the last 100 yards on the first round. Dixon was No. 25, and followed me round, and as I, unfortunately, failed both times I was stuck near the top and saw him pass.

S. RODWAY, No. 21.

[6166.]-For the information of "Observant" [letter 6146], it was on the occasion of the P. J. Evans trophy that I climbed Sunrising Hill with my $3\frac{1}{2}$ h.p. three-speed New Hudson and sidecar with passenger.

I believe Mr. P. J. Evans, the donor of the trophy, was observing at the hairpin corner, and Mr. G. Bell at the top, whilst Mr. K. Clark, one of the competitors, rode up the hill with me.

It is a pity "Observant" was only observing the first ascent of the hill, when, it is true, I failed near the top, owing to a partially choked jet, but perhaps he was like the gentleman in the song, "Afraid to go home in the dark," so did not witness the second ascent after tea.

If he is still doubtful, I should be very pleased to make a small sporting wager that I could repeat the performance.

H. G. DIXON.

Waterproof Motor Cycle Clothing.

[6167.]-I read with interest your footnote to letter No. 6144, and willingly bear with you in your statement that competition riders generally don an oilskin when in for a soaking, and no wonder. I have ridden in a pouring rain (more or less) from 7.30 a.m. to 9.30 p.m. not with an oilskin new for the ride but with one that I had used for wild-fowling the previous winter, and anyone who goes in for that kind of sport will know the test waterproof clothing has. As to the proofing chipping off, oilskins do not do that now, as they are not made sticky, but are soft and pliable, and sold in any shade.

AB 275.

[6168.]-With reference to letter No. 6144, I quite endorse your remarks about rubber-proofed material becoming sodden after continuous rain. I am an ardent motor cyclist, and am wearing a suit which has no rubber in it, and I have found it takes a lot of rain to go through it.

Another advantage is that I can dry it before a fire in about ten minutes. You cannot do this with a rubber-proofed suit. Another point is that the material is porous, and therefore quite healthy to wear. Motor cyclists use their overalls in wet or fine weather, and therefore want something suitable for both. When you are walking or starting a motor cycle you are apt to catch the overall (at the fastening) on the footrest, and with a rubber-proofed garment it is ripped to the top in a second, but with the cloth I am using I find it only pulls the studs undone.

IT 49.

Will the Ultra-lightweight Return?

[6169.]-Mr. Roy Walker in your issue of November 23rd gave it as his opinion that an ultra-lightweight would not be worth riding if made. If by riding he means riding at an average speed of twenty miles per hour he is, probably, correct, but if one be content to average twelve miles per hour then the machine would be as well worth riding as the push-cycle is.

My specification for such a machine would be: strong roadster frame, such as the Rudge-Whitworth de Luxe roadster, 1 $\frac{1}{2}$ in. tandem tyres, engine developing 1 h.p. actual, chain drive using largest size push-cycle chains, Sturmey-Archer three-speed gear. Probably, the push-cycle gear, which is amply strong enough for tandem work, would be suitable. The gears, with ratios 8, 10, and 13 $\frac{1}{2}$ to 1, would give, using 28 in. wheels, and with engine speed 1,500 revs. per minute, speeds of sixteen, twelve and a half, and nine miles per hour.

It would be interesting if the Sturmey-Archer Company could tell us if their push-cycle gear would stand up to the work; the gear would have to be made without a free-wheel, or a special starting gear like that used on the early Humber machines, would be required.

J. HART-SMITH.

[Sturmey-Archer Gears, Ltd., evidently do not consider their push-cycle gear suitable even for an ultra-lightweight, as they have brought out a three-speed motor cycle gear for lightweight.]-Ed.]

A Schoolboy's First Tour.

[6170.]-I notice in your last issue an account of a boy riding a distance of 190 miles in one day. During the summer my boy, who is fifteen years of age, rode from Edinburgh to Bridlington, a distance of 264 miles according to the Cowey speedometer, in one day. We left Edinburgh at 8 a.m. and reached Bridlington at 9.30 p.m., he on a light-weight Humber (2 h.p.).

A.N.C.

Lubricating Pumps.

[6171.]-With reference to the lubricator illustrated in your last issue as introduced by Mr. Sarolea, I would like to point out that this is just my "tapless pump," designed and put on the market by me in 1908. The details are just a replica of this with the exception that the discharge hole in the plate is elongated into a slot and a pointer fixed to the handle.

Any of my tapless pumps will act in the same way if the discharge is only turned partly on. As we have been experimenting on the same lines for some time, but were not sufficiently satisfied with the device in this stage of progress to market it, I am advising you so that I may not find myself in the position of being accused of copying one of my own devices a little later on, an occurrence not unknown to me.

A. C. DAVISON.

Petrol Charges in Oxford.

[6172.]-I see "Oxonienists" in letter No. 6147 complain of the high price of petrol in Oxford. It may be interesting to know that in Cambridge this term I have frequently paid 1s. 4d. for Shell, and the minimum has been 1s. 3d. for Pratt's. It is a well-known fact that fancy prices exist for many things in the Universities, and it would be interesting if you would let us know the standard price of petrol in London and other towns during the last three months.

CANTABRIGIENSIS.

[The price of petrol in London is published every week in our sister publication *The Autocar*. The price has been 1s. 2 $\frac{1}{2}$ d. for several weeks. The fact that both University towns are far from a distributing centre may account for the comparatively high prices.—Ed.]

Carbon Deposits.

[6173.]-I see that a correspondent, writing under the name of "Archibald," thinks that he has scored off Mr. W. Elder. Perhaps he does not realise that the results of Mr. Elder's analysis are just what might be expected in vegetable ash. Any of your readers with a slight knowledge of chemistry and an hour to spare could demonstrate the presence of these substances in his tobacco ash. "Archibald" had better be more certain of his facts before next making a public exhibition of his foolishness and discourtesy.

R. FISHER.

[6174.]-I am quite sure you do not intend your columns to be utilised for the exploiting of despicable practical joking of the type of which "Archibald" appears so proud.

Very probably Mr. Elder, as a professional man, is fairly fully employed. Notwithstanding this he has offered, in the interests of motor cyclists in general, to devote his expert knowledge to the solution of a matter which has considerable bearing on the design and efficiency of motors.

It may probably be instructive to "Archibald" to learn that the analysis which Mr. Elder sent is exactly what one would expect to find as the deposit resulting from the slow distillation of many vegetable products.

Tobacco is well-known to contain a very large proportion of volatile oil, and almost any plant will be found in its own tissues to contain all the ingredients detailed by Mr. Elder in his analysis.

His deduction that these mineral matters, silica, ferric oxide, alumina, lime, etc., constitute road dust, is only natural, seeing that he has been misled by the implied statement that the deposit was from the cylinder of a motor engine. He is therefore perfectly justified in his remark that the material might be considered to be road matter.

I feel so much sympathy with Mr. Elder in the matter that I have trespassed on your space to this extent, and I am quite confident the disgust I feel in regard to this despicable trick is shared by the average motor cyclist, who, I am sure, will equally resent the misuse of the pages which you so kindly place at our disposal in the interests of the pastime and industry.

H. J. POOLEY.

Lubrication Systems.

[6175.]—I read the article in the last issue on lubrication with the greatest interest, and in reading it it has occurred to me that the idea of regulating the oil supply to engine requirements could also be effected where the lubrication is automatically forced to the engine by a spring pushing on the plunger of an ordinary oil pump. I would like to suggest that there is probably no insuperable difficulty in connecting up the throttle with a by-pass from the pump, so that, as the throttle is shut down, superfluous oil is passed back to the oil tank. The automatic plunger pump has the disadvantage of depending on the carefulness of the rider, but it has the advantage of simplicity. Some may object to a spring action instead of a positive action, but so long as they employ engines with spring worked valves, moving 500 to 1,000 times in a minute, I do not see that they can logically object to a mechanism in which a spring is compressed to the full, say every twenty minutes. A.B.

[The suggested idea has been used for months on racing machines, but not inter-connected with the throttle.—Ed.]

A Motor Cyclist Over Seventy Years of Age.

[6176.]—As the summer is past and races and hill-climbs are quiet, perhaps it would interest some of your readers (especially those who wrote congratulating me a year ago on taking to a motor cycle at my age) to know that I am still riding and have had a good year, my mileage reaching 10,000, and if I had the leisure it would be double. I changed my single-gear Douglas for one of lower build, as I am short in the leg, and tried a two-speeder with gears 5 and 8, and found it first rate. I am now changing for one of the Douglas latest models, and placed the first order given in the Show with the Colmore people, who always treat me well, and am promised early delivery. I have not ridden for a year without meeting some difficulties. Once the engine went wrong, but I was near a railway station, and got home without trouble. Another time, half way between Bridgnorth and Cleobury Mortimer, and in the middle of a steep hill, a large nail made four punctures, and, in putting two large patches on, I left one hole uncovered. I thought then I was certainly stuck up for the night, seven miles from any station. As I never have a companion or stay away from home at night, my anticipations were decidedly depressing. However, I had another try, and faced the difficulty to get going on a stiff hill. I ran, but the engine would not fire. I tried again, when it fired and stopped, and my wind stopped, too. After a rest, and cleaning the jet with a bit of thin wire, with a run and a strong heave it fired all right, and I reached home before lighting up time.

Once the exhaust lifter wire broke two miles from Lich

field. I was in trouble then, but another motor cyclist came along who had ridden some of the early makes; he knew what the trouble was and how to mend it. He said, "Can you ride with throttle control only?" Yes, I could. "Get on then and pedal hard while I push." In ten minutes I was in the garage. My gratitude to that motor cyclist is great. Punctures I have got used to, having had twenty in the year. Once a cow suddenly came out of a field and knocked me into a ditch with cycle on top; once I skidded on the tramlines and hurt my leg a little; and I had other mishaps which make up the harmony of every cyclist's life. Still, I say, though time is getting short with me, I am looking forward to the pleasantest year of my life. *My motor bicycle and I!* And I hope that many who in life are tired and dull will try the new and safe sensation of motor cycling. Wishing you a happy Christmas. THOS. ABLE.

Touring in South-west. Wales

[6177.]—I am sorry I caused Mr. Evans's "hair to rise" by my letter. He writes about the Llanybyther-Llansawel Road, which is a good main road, and well within the powers of his 4 h.p. Stevens. I wrote about the mountain road from New Inn, *via* Bryn Llwllyn—the "New Quay Road," as the mountain signposts describe it. I am satisfied that no single-gear machine could be ridden across this road in the condition it was in three months ago, unless the machine was geared about 8 to 1, for the simple reason that the rider would not be able to steer and keep his seat at the speed it would have to be driven, with a standard gear.

I expect that I am as well acquainted with the roads of Wales as Mr. Evans is. I am a Welshman, "whateffer"!

In reply to Mr. Robbins, my point was that, when touring, one does not expect to stop at the foot of a steep hill to cool the engine. Why do so in a "trial," which is, I take it, supposed to find out the best touring machine?

Re your footnote to letter 6144, my experience agrees with yours. Rubber-proofed suits will keep rain out for two or three hours; after that, one becomes damp, especially about the knees. Oilskins, though uncomfortable, unsightly, and unhygienic, are the only garments I have found to keep one dry, when out all day long in the rain. BD 50.

SUMMARY OF CORRESPONDENCE.

Will the motor cyclist who lent a T.T. Norton rider a new Reliance plug, on the Birmingham-Bristol Road, on the 4th inst., please communicate with R. E. L. Saunders, c/o the editor?

"J.W.J." points out that the A.I. mud screen is an excellent device not mentioned in the article "Mudguarding," published in the issue of December 7th.

W. H. Bashail (8 h.p. Matchless-Jap) at speed in the Gometz-le-Chatel (France) hill-climb on Sunday last. He accomplished fastest time of the day.

French Winter Hill-climb.

IT was indeed a merry party which left the shores of dear old England on Saturday last to participate, either as competitors or spectators, in the A.C.C. de France hill-climb at Gometz-le-Châtel. The 2.20 express from Charing Cross was as crowded as ever; people fought for places which were far outnumbered by their applicants. Twelve seats were engaged by the Royal Automobile Club Touring Department for the Auto Cycle Union, but six other members availed themselves of the cheap tickets, and disposed themselves as best they could in the train. W. Cooper left his Bradbury sidecar behind, as the price of the freight frightened him. F. W. Barnes, however, took his Zenith sidecar and represented the English passenger motor cycles. Among the passengers the train was taking to the sunny Riviera and to the glistening Alps, not a happier party could be found than the A.C.U. members, who were out to show their French *confrères* in the sport what their British-built machines could do.

The first part of the journey was soon over, and then came the sea crossing. The motor cycles, handled mainly by the competitors themselves, were stowed aboard the *ss. Empress*, and a good crossing was enjoyed.

On French Soil.

At Boulogne there was somewhat of a rush. There are two trains by this service, the *Rapide*, which is due in Paris at 9.16, and another which does not arrive till 11.25 p.m. All the party were naturally anxious to travel by the former. Each man, therefore, flew to his mount, all helped one another with a will, and in less time than one can imagine the red Indian, the ruddy-hued Matchless machines brought by Carter, Witham, and Webster, the green-tanked Ridges of Gibson and Spencer, Cooper's Bradbury, and McMinnies' Triumph were bundled into the *douane*, to the consternation of the Customs officials, who were asked to be good enough to pass them, as everyone wanted to be off. The *douaniers* threw up their hands and said, "*Impossible!*" but Major Stevens's man, the R.A.C. agent, talked to them persuasively, and the international pass question was put off till Paris was reached.

The machines were put in the van, the whistle and the tin trumpet gave their old familiar notes, and we were off—off to gay Paris. One man alone was unhappy, and that was Barnes, whose machine was missing at Folkestone, but on being told not to worry, but to wait and see, he calmed down somewhat.

A Little Difference of Opinion.

Then one member of the party who knew the book of the words, gently told the others that their tickets were not available by the *Rapide*, and an official of the Northern Railway quickly confirmed his statement. The party pretended for the time being that they knew no French, but were told that the official said, "Very well, then, out you get at Abbeville." Then came the

guard and the interpreter of the party—the latter on this occasion chanced to be ourselves—and we were hard put to it for ten minutes. "Nineteen francs each to pay," said the guard, and matters looked truly serious. Happily, a letter from the R.A.C. Touring Department was produced, telling us that a supplement of 6 francs 25 c. each would suffice, and, to make a long story short, it worked. The guard got a little *pourboire* on each excess fare, and left our compartments a deal happier man than when he entered them.

At the Gare du Nord, Messieurs Debailly (president), Cheilus (vice-president), Robert Lecomte, and Gream Fenton, of the Auto Cycle Club de France, met the competitors, and rendered them valuable assistance, and while we went ahead and engaged the rooms at the Hotel des Colonies, the machines were taken off the train, and, as the customs examination was of the scantiest, the men were soon pushing their mounts, among which was Barnes's missing Zenith and sidecar, towards the hotel.

The Day of the Competition.

As the party had to be early away in the morning, and so much had to be seen in such a very short time, several members had little rest. We were all up at 5.15 a.m., and just on six were on the way to the Luxembourg Station, under the able guidance of Gream Fenton.

The 1 in 20 gradient in the Boulevard St. Michel, just before the station was reached, proved quite enough for the majority, especially after their previous exertions, and on arriving at the station their tempers were not improved on being told that they would have to push to the second station down the line, as the machines could not be taken on board at the terminus. Eventually we were all *en voiture*, and a start was made for Orsay, the nearest station for Gometz, which was reached in about an hour, and, getting petrol in the town, the men were soon *en route* for the hill, four kilometres away. Greatly to their surprise they found the hill was practically the main street of the village. Imagine it, good readers! A hill-climb in a village, in a ten kilometre limit (6 m.p.h.), including a cross road danger sign. Believe, if you can, that a Paris street sweeper with gaily revolving brush removed all the grease possible just before the start, and picture to yourself the gendarmes, the Garde Champêtre, and other officials of the Government calmly looking on in a spirit of *camaraderie* almost incomprehensible to the English mind.

Gometz-sur-le-Châtel is a picturesque village, the predominant feature of which is the old church, a noble pile standing on the hill, from whose summit the whole of the absolutely straight course and a pretty rural scene could be discerned, bathed in brilliant sunshine.

At the foot of the hill MM. Bardin and Plazolles looked after the sealing, MM. Buissard and Migault

French Winter Hill-climb.—

(treasurer of the A.C.F.) officiated at the start, while M. Bazin took the times at the foot, and M. Carpe officiated in a similar capacity at the finish.

Preliminary Canters.

Incidents during the preliminary preparations were fairly frequent. McMinnies and Spencer opened the ball by riding up the hill on the wrong side of the road, and a smash-up was narrowly averted. Moorhouse went up like a rocket, and returned to the foot covered with mud, and well-nigh unrecognisable. His front mudguard had been omitted, and a jury-rigged affair had hastily to be improvised. The English riders created an impression at once. "*Regardez, les Anglais. Qu'ils sont fantastiques, ces gens-là!*" enthusiastically ejaculated a spectator. Among the French machines was an old International Cup Peugeot racer and a four-cylindrical René-Gillet (two pairs of V twin-cylinders opposed). The ignition was by accumulator and two contact-breakers. The carburetter was a Claudel-Hobson, the transmission by two belts, and the bore and stroke 90 x 100 mm. This machine, however, was totally unable to attain any speed, chiefly through misfiring.

The course was eighty feet short of half a mile, and the gradient, which was almost entirely without variation, about 1 in 12½.

There was some delay at the start, which did not take place till forty minutes after the advertised time, and when all was ready at the summit the officials were exercised in their minds as to how to communicate the good news to those at the foot. "Has anyone a revolver?" said an official. M. Carpe was ready in an instant, and drawing a weapon fired a shot. "*Encore!*" shouted the crowd, and four more shots were fired, but the desired result was not obtained, and a car had finally to be sent. The crowd was enthusiastic and generous to the English, and one of its members, a soldier of the 31st Regiment of Infantry, held in his hand a copy of *The Motor Cycle*.

SUCCESSFUL COMPETITORS IN THE FRENCH WINTER HILL-CLIMB.

(1) Canale (Alcyon), winner of the 300 c.c. class. (2) Péan (twin Peugeot), first in the class for 400 c.c. engines. (3) W. G. McMinnies (Triumph), first in the 500 c.c. class. (4) A. J. Moorhouse (7 h.p. Indian), second fastest time of the day. (5) W. H. Bashall (8 h.p. Matchless-Jap), winner of three classes and fastest time of the day.

French Winter Hill-climb.—**VOITURETTES, CLASS I.—SINGLE-CYLINDER UP TO 90 MM.**

1. Dupre (La Ponette)	1m. 26 $\frac{1}{2}$ s.
2. Peltier (Cohendet)	1m. 35 $\frac{1}{2}$ s.
3. Guerry (Guerry-Bourgignon)	1m. 40s.

VOITURETTES, CLASS II.—FOUR-CYLINDER UP TO 65 MM.

1. Granvaud (La Ponette)	53 $\frac{1}{2}$ s.
2. Fort (Ronteix)	2m. 2s.

VOITURETTES, CLASS III.—OPEN.

1. Bourbeau (Bedelia)	44 $\frac{1}{2}$ s.
2. Coudert (Lurquin-Coudert)	2m. 23 $\frac{1}{2}$ s.

CLASS IV.—500 C.C.

1. McMinnies (T.T. Triumph)	32 $\frac{1}{2}$ s.
2. Gibson (Rudge)	34s.
3. Gabriel (Triumph)	39 $\frac{1}{2}$ s.
4. Spencer (Rudge)	43 $\frac{1}{2}$ s.

PASSENGER MOTOR CYCLES.**CLASS II.—Unlimited.**

1. Barnes (Zenith-Gradua)	43 $\frac{1}{2}$ s.
2. Rayer (René Gillet)	49s.
3. Sandfort (René Gillet)	1m. 1s.

MOTOR BICYCLES.**CLASS V.—Unlimited.**

1. W. H. Bashall (Matchless)	28s.*
2. Moorhouse (Indian)	28 $\frac{1}{2}$ s.
3. Barnes (Zenith)	30 $\frac{1}{2}$ s.
4. McMinnies (Triumph)	31 $\frac{1}{2}$ s.
5. Péan (Peugeot)	32 $\frac{1}{2}$ s.
6. Gibson (Rudge)	34s.
7. Naas (Grifon)	37 $\frac{1}{2}$ s.
8. Théry (René-Gillet)	39 $\frac{1}{2}$ s.
9. { Meuriot (René-Gillet)	43 $\frac{1}{2}$ s.
{ Spencer (Rudge)	
11. Cooper (Bradbury)	43 $\frac{1}{2}$ s.

*Fastest time of day.

AMATEUR CLASS.

1. Bashall (Matchless)	28s.
2. Moorhouse (Indian)	28 $\frac{1}{2}$ s.
3. McMinnies (T.T. Triumph)	35s.
4. Guillon	35 $\frac{1}{2}$ s.

In the general classification the positions in Class V. were repeated.

Some Remarks on the Competition.

The French machines were far and away behind the English, which is not surprising, since the industry is just arising from a lethargic state. The organisation was also a little inferior, as the A.C.C.F. has not held a purely motor cycle hill-climb for four years. The Frenchmen, however, behaved in a thoroughly sportsmanlike manner, and took their

beating like sportsmen. Canale, the Alcyon rider, the winner of Class II., rode in the T.T. Race this year. Spencer's machine was off colour, as the carburetter was starved. Rivière (Mototri-Contal) competed in the A.C.U. trials of 1905. To W. H. Bashall, it will be seen, belongs the honour of making the fastest time of the day, while Moorhouse, who was only $\frac{2}{5}$ s. behind, pressed him very hard.

Reviewing the wins, it will be noticed that Class I fell to that well-known French make the Griffon, the Alcyon—so successful both in England and France—won Class II., and the famous Lurquin-Coudert won Class III. In Class I. of the passenger machines our old friend M. Contal deserves congratulations. Classes I. and II. of the voituresses were won by the La Ponette, lately described in these pages, while Class III. of this category was won by the Bedelia, guided by its designer, M. Bourbeau.

Now we come to the British wins. Class IV. was won by McMinnies (Triumph), the passenger Class II. was won by Barnes (Zenith-Gradua), the like of whose sidecar machine, to judge by the critical examination it received, had never been seen before in France. Class V. was won by Bashall, whose Matchless this time gained a glorious victory, with Moorhouse (Indian) second. The amateur class resulted in the same way.

Turning the Tables.

The whole trip has been an unqualified success. The Frenchmen, who on the occasion of the last International Cup Race in France, beat the English, though they themselves were conquered by the Austrians, have been vanquished by us on their own ground. Their defeat, however, will, we trust, have a beneficial effect, as, since they are a fighting nation, it will give them an incentive to do greater deeds, and next time we hope to meet them on more even terms. This week end trip, in the running and organisation of which the A.C.U. has taken such a prominent part, has done much good; it has opened the eyes of many prominent English riders, and has again helped to revive international competition; while it may do more, namely, rouse the motor cycle industry in France from the lethargy into which it has fallen.

SUTTON COLDFIELD A.C.**TWO-DAYS' RELIABILITY TRIAL.**

The annual reliability trial for the "Sutton" Challenge Cup and gold medals was held on Saturday and Sunday last. The weather on both days was terrible, and the muddy state of the roads made it a most difficult task to hold the machine up. At Tamworth the river had overflowed and covered the whole of the road for about fifty yards with water nearly a foot deep. This had to be ploughed through on all three circuits, and was the means of spoiling several non-stop runs. Only seven of the thirty competitors finished the whole course, and these must be congratulated on their really fine performances. The winner of the cup and Murratti "Ariston" Trophy was to be decided at a meeting last evening (Wednesday), and will be announced in our next issue. List of survivors:

F. A. McNab (2 $\frac{1}{2}$ Trump-Jap)	J. J. Woodgate (4 Singer)
W. B. Gibb (2 $\frac{1}{2}$ Douglas)	H. Pickering (2 $\frac{1}{2}$ A.J.S.)
T. Pollock (3 $\frac{1}{2}$ James)	W. H. Sheldon (3 $\frac{1}{2}$ Regal-Precision)
H. C. Newman (3 $\frac{1}{2}$ Ivy-Precision)	

Thanks are due to the hard-worked officials, including Messrs. Alec Ross, P. Mosedale, Gordon Owen, R. Duke, R. Collins, Howard Smith, S. Rowlandson, W. Busby, and W. Gilbert. Mr. James St. John was the trials hon. secretary.

LONDON-GLOUCESTER AND BACK.

Below we give the entries to date for the N.W. London M.C.C. open reliability trial to Gloucester and back by way of Birdlip on Saturday, 30th inst.

Glyn Rowden (3 $\frac{1}{2}$ Triumph)	F. Applebee (3 $\frac{1}{2}$ Scott)
D. Grey Blakey (3 $\frac{1}{2}$ Quadrant)	R. Lord (Rex Sidette)
E. Gwynne (3 $\frac{1}{2}$ Triumph)	J. Hilyer (3 $\frac{1}{2}$ Premier)
E. Pond (3 $\frac{1}{2}$ Rudge)	Eric Rose (3 $\frac{1}{2}$ Triumph)
W. Cooper (3 $\frac{1}{2}$ Bradbury)	E. Laurence (3 $\frac{1}{2}$ Triumph)
W. Oldman (8 Bat)	J. W. Thomas (2 $\frac{1}{2}$ Douglas)
H. C. Mills (3 $\frac{1}{2}$ Premier)	Frank Thomas (6 G.O.K.)
Hal Hill (3 $\frac{1}{2}$ Centaur)	F. W. Applebee (2 Centaur)
R. Scott (3 $\frac{1}{2}$ Triumph)	E. Pither (3 $\frac{1}{2}$ Rudge)
O. Hill (8 Jap-G.N.)	D. Berne (3 $\frac{1}{2}$ N.S.U.)
A. E. Hawkis (2 $\frac{1}{2}$ A.J.S.)	E. G. Westacott (3 $\frac{1}{2}$ Zenith)
H. H. Berlandina (3 $\frac{1}{2}$ P. and M.)	H. J. Pooley (3 $\frac{1}{2}$ Premier)
	R. L. Printz (5 B.A.T.)
	Rex G. Mundy (3 $\frac{1}{2}$ Singer)

Entries definitely close to-morrow (Friday).

The start of this trial is at 7.15 a.m. from Jack Straw's Castle, Hampstead Heath, and the route is *via* Stanmore, Pinner, Rickmansworth, Amersham, High Wycombe, Oxford, Faringdon, Cirencester, Birdlip, and Gloucester, returning by the same route, the first pair being timed away from Gloucester at 2.2 p.m.

To Our Readers.

The Editor and staff of this journal seize this fitting opportunity of wishing all readers at home and abroad "A Happy Christmas and a Prosperous New Year."

English Motor Cyclists in France.

It was W. Cooper who first arranged with McMinnies to go over to the Auto Cycle Club de France winter hill-climb, the classes and details of which had appeared in *The Motor Cycle Show Report Number*. There the matter rested until the M.C.C. dinner, when Cooper mentioned it to several well-known riders as well as to ourselves, and the party was soon increased to half a dozen. In the end seventeen journeyed to Gometz-le-Châtel, and their bag of five firsts is a proof of the efficiency of the English-built motor cycle. In the unlimited or open class, riders of English machines occupied the first four places.

Through French Spectacles.

In its description of the hill-climb held at Gometz-le-Châtel last Sunday, one of the French sporting dailies says: "The English team, which arrived with perfectly tuned engines possessed of remarkable speed and power, made an extraordinary impression. This team won on general classification, its members being first, second, third, and fourth; it also won several other classes, and a member made fastest time of the day. All this because England has never allowed the sport and industry to decline." The same paper says: "If our compatriots respond to the impetus which they have received, an international contest next year would prove interesting. This year's event has only proved our inferiority, which, however, we hope will be only momentary." We echo our contemporary's wish; nothing would please us more than to see a well contested match, say, at Brooklands. French riders would do well to bear in mind that our Six Days' Trials and Tourist Trophy Races are always open to them.

The Future of International Competitions.

Now the visit of an English team to France to take part in a hill-climb has been so successful, there was much talk of the French club sending a team to meet the English riders on a well-known hill near London, while several suggestions were made as to holding the T.T. Race in France next year. Quite a happy idea was that of organising a hill-climb at Gaillon which is so near Dieppe. It can be reached from there in two hours by road which would save

much expense and be more pleasant for the competitors. There was also talk of issuing an invitation to English riders to take part in a tour in, say, the Loire Valley at Easter. Everywhere we were received with warmth and hospitality.

Sixty-two m.p.h. through the Mud.

W. H. Bashall who made fastest time in the French hill-climb last Saturday, averaged a speed of just over sixty-two miles per hour on his belt-driven overhead valve Matchless-Jap. A. J. Moorhouse on the big Indian was very little slower. It should be borne in mind that the road surface was heavy, and had merely been scraped of mud.

An Important Judgment.

At the Shrewsbury County Court last week, His Honour Judge Harris Lea had to decide for the first time in the courts, whether leaving a bicycle against a kerb was or was not an act of negligence. The case arose out of an action for damages brought by a livery stables proprietor whose horse had been frightened by a bicycle, which had been left against the kerb by a boy, falling over and so

FRENCH WINTER HILL-CLIMB
(Illustrated).

startling the horse, which sprang suddenly to one side and in so doing broke a bone in its leg. Eventually the animal had to be slaughtered. The judge decided that it was not negligence to leave a bicycle against the kerb.

The London-Exeter Winter Run.

The list of entries for the M.C.C. London-Exeter London winter run closed with a total of 119, composed of three cars, forty-five passenger motor cycles, and seventy-one motor bicycles. The unlucky number thirteen falls to W. T. W. Wartnaby, the designer of the new W.D. motor bicycle which is to make its initial appearance in this trial. The engine, it will be remembered, has forced lubrication to all bearings.

Late entries were:

F. Begley (5 Matchless).
C. M. Webster (8 Matchless and sc.)
E. J. Webster (8 Matchless and sc.)
P. G. E. James (8 Chater-Lea and sc.)
H. C. Griffin (8 Bat-Bondex and sc.)
F. C. North (3½ Ariel).
H. Johnson (Triumph)

FRENCH WINTER HILL-CLIMB (pages 1401-1403).

F. W. Barnes (Zenith-Gradua sidecar), who, as is his wont, headed the list of passenger motor cycle riders, beating the next competitor by 6½ secs.

Another Motor Cycle Stolen.

A 6 h.p. twin a.o.i.v. Jap with B. and B. carburetter and accumulator ignition was stolen from Hornsey Road, London, N., on the night of the 13th inst. It is the property of P. S. Burnay, and any reader who is offered this machine should notify the Hornsey Road police station.

English-Dutch Reliability Trial.

A sporting reliability trial between mixed teams of amateurs and trade riders is being organised by the Dutch M.C.C. for August Bank Holiday, 1912. The regulations are published on page 1388. British riders' entries may now be forwarded to *The Motor Cycle*.

A Novel Event.

An A.C.U. permit has been granted to the Herts County A.C. to hold an open motor cycle reliability trial on January 20th. The distance will be about 100 miles. There will be a fast hill-climb, a slow hill-climb, and a speed-judging contest (competitors will have to cover a certain section at 10 m.p.h. on their own estimation).

Yankee Journalistic Methods.

There is an American paper named *Motor Cycling* which makes a practice of reproducing sketches from *The Motor Cycle*, and paraphrasing the matter accompanying them without the slightest acknowledgment of the source from which the drawings or matter were obtained. Even if it were our policy to do so we could not return the compliment by copying American drawings, as those of the paper in question are much too poor to ever find a place in these columns.

How he got his Own Back.

A motorist was caught in a police trap in a fashionable part of London recently—a fact which greatly aroused his ire, and caused him to ponder over the matter deeply. The result of these deliberations led him to hit upon a plan. In the course of his walks during the next few days he kept his eyes wide open and took the number of every policeman who gossiped, as the best behaved policeman will do, with the fair denizens of the nursery and area. Well-nigh 100 poor bobbies were caught in the act, their leave was stopped, and now they swear to catch the informer if he drives at but 20.1 m.p.h.

A Motor Cyclist's Successful Appeal.

The bill of suspension in the case in which F. K. Dickson, of Mauchline, was fined £2 10s. for driving a motor cycle at a speed exceeding 10 m.p.h. at Crookedholm, Kilmarnock, was heard at Edinburgh last Thursday—the Lord Justice-Clerk, Lord Dundas, and Lord Guthrie on the bench. Defendant was tried by Sheriff-substitute Mackenzie on October 13th, and he contended that the conviction should be set aside on the ground of its illegality, as he received no warning of the intended prosecution. Furthermore, the method adopted of ascertaining the speed of the motor cycle was absolutely unreliable, and the only evidence was that of the two constables. The Lord Justice-Clerk, in giving judgment, said the system adopted in ascertaining the speed was a bad system, and a better could easily be obtained. With regard to the point in this case, he was of opinion that the conviction could not stand. The conviction was therefore quashed, with expenses.

Ancient Machines in the Winter Runs.

Hal Hill—well known as a Bat-Jap owner—is one of the entrants for the Gloucester run, and will ride a 3½ h.p. Centaur which he describes as old, aged, decrepit, and infirm. The reason for this "departure from standard" is that he is tired of competing in trials on machines that, bar accidents, cannot fail to get through, so he is trying his luck with his "extra special 1½ cat power 'bus, which has chain drive and no puff at all." We admire his sporting proclivities.

" 30.	Derby and District M.C.C. Open Hill-climb.

Proposed Track for the Midlands.

The latest information regarding the proposed two-lap racing track to be built in the Midlands is that Mr. F. A. McNab, the originator of the project, expects to be in a position in a week or two to float a company to acquire the land and build the track. A site has been selected which can be secured at a reasonable cost. Readers of this journal who wish to become financially interested in the flotation should communicate with Mr. McNab, c/o Trump Motors, Ltd., 36, John Bright Street, Birmingham.

Accident to a Well-known Rider.

H. H. Bowen was motor cycling on the Kenilworth Road, near Coventry, on Tuesday evening last week when he ran into the back of a cart which, it is alleged, had no rear light. Bowen was unconscious of the presence of the cart until he almost caught it up, when he immediately swung aside, but unfortunately caught the hub cap with his knee, the force of the impact being sufficient to knock the hub cap flat. He suffered a broken leg, and was conveyed to the Coventry and Warwickshire Hospital in a car, and we are glad to say is progressing favourably. Strangely enough, his Rudge was hardly damaged.

Taunton, Next Year's Six Days' Trials Centre.

An invitation has been received from the Taunton and District Motor Cycle Club to hold the Six Days' Trials in the neighbourhood of Taunton. This town, on account of its position at the entrance to the difficult country in the West of England, its proximity to Ilfracombe, Lynmouth, Dawlish, Torquay, and other well-known West-country seaside resorts, and the excellent hotel accommodation it possesses, lends itself admirably as a centre. The Mayor of Taunton and several prominent local residents have offered prizes to be awarded in the contest, while promise of every assistance has been received from the Taunton club and its captain, who is the district surveyor, and whose knowledge of the roads is, in consequence, considerable. The Competitions Committee of the A.C.U. has therefore recommended the General Committee to accept this invitation.

Stolen Machine.

The Bradbury machine referred to in the paragraph on page 1375 last week as having been obtained under false pretences bears the number 33293 stamped on the seat pillar lug.

EN ROUTE FOR THE GOMETZ-LE-CHATEL HILL-CLIMB.

Some members of the A.C.U. party of motor cyclists photographed at Charing Cross Station on Saturday afternoon before leaving for Paris—Messrs. Cooper, Carter, Witham, and C. and E. Webster.

The Motor Cycle

and Theatricals.

IT is well known that motor cycles are largely used by members of the theatrical profession, and the pastime is growing so much in favour that the George Edwardes Motor Cycle Club is now an actuality. True, the members number but five at present—four active riding members and one hon. member of the gentler sex, who rides in a sidecar attached to her husband's Rex.

Recently, a motor cyclist contributor, who has a friend taking the part of Prince Danilo in "The Merry Widow" touring company, hied himself to the stage door to talk over motor cycle matters with this friend, but a surprise was in store for him, for he was introduced to all the members of this active band. The rules of the club are few and far between; to become a member, you must be a motor cyclist and attached to one of George Edwardes's companies in some capacity or other. It would be difficult indeed to find a more enthusiastic set of all-weather long-distance riders than the members of this club. Our representative's gleanings from each are interesting enough to warrant publication, and we hope they may be the means of introducing the pastime to other members of the theatrical profession who may be hesitating before making the final plunge.

The Prince's Hobbies.

Mr. J. Warren Foster, who takes the part of Prince Danilo, says: "Since I was 'weedled' on to a motor cycle some twelve months ago, golf, my former hobby, has been neglected. My first ride was for forty odd miles, and during the run the route lay through Manchester. I managed all right, but was somewhat scared with tramlines and traffic. I subsequently purchased a Triumph, which I used with a sidecar, and it did remarkably well, but I consider a run from Burnley to Skipton took the biscuit. We were finishing the tour at Burnley, and it was necessary that two of us should be in London early next day, so, after the show and a good supper, we set off from Burnley at 12.20 a.m. to catch the 1.12 express to town at Skipton, twenty miles away. I carried my passenger on the carrier (the first time I had ever attempted such a thing); he was enveloped in two big overcoats and carrying a large parcel. The night was pitch dark, and we had to negotiate eight miles of tramlines. Opening the throttle, we went for all we were worth, round corners as if the old man called Harry was after us. Neither he nor I really enjoyed the ride, but it had to be done, and done it was, but only just. On wheeling the machine into the station, I noticed one of the stays of the carrier had bent and was nearly rubbed through by the belt rim. What

would have happened if the carrier had broken? Recently I purchased a $3\frac{1}{2}$ h.p. three-speed New Hudson, and after doing close on 2,000 miles I am more delighted with motor cycling than ever. Nowadays, be the weather what it may, all my journeys from town to town are carried out on my machine. The distances to be usually covered are between 100 and 200 miles; my longest day's ride, accomplished on a Sunday, was from Exeter to Land's End and then back to Torquay. As regards the health question, I can truly say that since taking up this sport I have felt quite another man, and should I wake up in a morning feeling somewhat seedy, it only requires a couple of hours on my machine to put me right once more."

The Ambassador's Adventures.

Mr. H. Sinclair Cotter, who takes the part of Baron Popoff, the Marsovian Ambassador, stated that he had been a motor cyclist for about seven years. "Quite a pioneer," I remarked. "I must have completed over 50,000 miles during my time," he went on to say, "and have had a trailer in use, with which I used to cart my little dog and my brother from town to town, and that reminds me of a little experience. One night we had pulled up for refreshments, and after satisfying ourselves we returned to the machine, which naturally was only of low power. I got all the levers set, and with a shout of 'Ready!' heaved off. Strange to relate, the machine started off at once, and we bowled along merrily. At last we encountered a hill (nowadays called a small hump), and a little l.p.a. was necessary, and then I hopped off and ran alongside. The engine pulled splendidly, so I congratulated myself, and stopped at the top to say to my brother, 'I think we could have managed without running.' Hearing no reply, I turned round and found, much to my astonishment, the only passenger I was carrying was my dog! After thinking things over, it struck me that my brother could not have fallen out, otherwise the dog would have gone likewise, so I sat down to wait developments. Eventually my brother arrived, having had to walk, and then—curtain! I am now riding a Triumph, but since seeing the new machine of the Prince's I am crying out for a three-speeder, all the more so because I use a sidecar considerably. If it is at all possible to use my machine for travelling, I always do so use it in rain or shine, as I find that the riding in the crisp fresh air is very beneficial to my health; it clears the brain wonderfully, and creates a splendid appetite. The longest run I ever had in one day was from London to Blackpool."

The Motor Cycle and Theatricals.—

Mr. Ripley Evans (Vicomte Camille de Jolidon): "It is a little over two years since I took up motor cycling, very much against the advice of my friends, who guaranteed me all sorts of ailments. Of course, as you know my part in the show, it is no use me recalling to your mind the fact that I have the most singing of any of the men to do, and therefore naturally I was somewhat dubious. However, taking my courage in both hands, I purchased a Douglas, and after that another Douglas, and finally I now possess a 3½ h.p. Premier, which is at present *hors de combat*, owing to an endeavour on the part of a dog to try conclusions with it. Result: Dog dead, Premier damaged, myself out of pocket. That, by the way, is

at which we happen to be playing. Personally, I do not like night riding, so, of course, invariably commence my journeys at daybreak. I never take any account of the state of the weather, and, although naturally I like dry roads and sunny skies, the general rule seems to be muddy roads and mournful skies. Altogether, I love motor cycling, and shall continue to follow up the game as long as possible."

Musician's Sidecar Outfit.

Mr. F. G. Hulley says: "I am the leading player of the musicians who travel with the company, and my wife is also a member of the same company. For some time now we have used a motor cycle and sidecar, my present mount being a 1909 twin Rex and sidecar,

MEMBERS OF GEORGE EDWARDES'S MOTOR CYCLE CLUB.

Below: Warren Foster as "Prince Danilo."

Mr. and Mrs. F. G. Hulley.

Sinclair Cotter as "Baron Popoff."

the only trouble I have had, unless, of course, you consider the breaking of a valve and having to be towed ten miles, because you were silly enough not to carry a spare, constitutes trouble. I must have ridden over 8,000 miles this year, my longest day's run being 230 miles, and, much to the chagrin of my advisers, I have been in better health since taking up the sport, and have actually missed fewer performances through colds and coughs than is usually the case with chief singers during an ordinary country tour. As a rule I use my machine always; by that I mean I use it for travelling from town to town, and for seeing the country round about any particular place

which we always use in preference to trains for passing from one theatre to another, irrespective of the time of the year and the weather conditions, and, although our journeys are invariably over 100 miles, I have never yet found any bad effects to my playing; in fact, rather the reverse, as the runs seem to freshen one up so thoroughly. My longest day's journey was 230 miles, and my total mileage is considerably over 15,000, and never once have I had any serious trouble with the Rex. My wife naturally prefers the warm fine weather, but nevertheless she is never backward in coming forward when I give her the slightest hint of a jaunt."

CLUB NEWS.

Burnley A.C.

The annual dinner was held on the 19th inst. at the Old Red Lion Hotel, after which the prizes and medals won during the year were presented to the fortunate competitors.

M.C.C. News.

The annual general meeting of the Motor Cycling Club has been fixed for January 10th, on which occasion it is hoped to organise an entertainment. Twenty-six members were elected at the last committee meeting.

Oxford M.C.C.

On Friday last, December 15th, Mr. J. W. G. Brooker read a paper, already referred to, on "The Lubrication of Motors." The lecturer referred to the different systems of lubrication which were dealt with in the article published in *The Motor Cycle* last week, entitled "Lubrication Systems."

Walthamstow M.C.

The annual dinner took place last week, followed by the presentation of prizes won during the past season. Among others a silver cup was presented to Miss A. Percy for a standard ride of 200 miles. Mr. Percival, the hon. sec., stated that Messrs. Godfrey and Applebee, and Mr. Peppercorn, had presented silver cups for competition during 1912.

Wolverhampton M.C.C.

On the 11th inst. the first smoking concert and presentation of prizes was held at headquarters, King's Hall Restaurant. During the evening the prizes won in the two competitions held were presented, and were as follow:

HILL-CLIMB UP TO 500 C.C.

Rider and machine.	Time.
1. G. Hill (3½ h.p. Rudge)*	44½s.
2. C. O'Connor (3½ h.p. Rudge)	47½s.
3. R. W. Bill (3½ h.p. Triumph)	47½s.

* Fastest time of the day.

OVER 500 C.C.

1. A. Jones (8-9 h.p. Matchless)	46½s.
2. H. W. Wolverson (4 h.p. Ireland)	46½s.

RELIABILITY TRIAL, 75 MILES.

	Variation of time.
1. A. J. Stevens (2½ h.p. A.J.S.)	2m. 32½s.
2. R. Tonks (3½ h.p. Ariel)	2m. 47s.
3. C. O'Connor (3½ h.p. Rudge)	6m. 5s.

Also during the evening the secretary announced that he had received an offer of a cup, for a members' competition, from Messrs. Stevens Bros. The event for which this is to be put up will be decided at a future meeting of the club.

Blackpool and Fylde M.C.C.

The club has held a whist drive and dance, also a concert, at which some slides lent by *The Motor Cycle* were exhibited. On the 26th inst. there will be a club non-stop run to Kendal, starting at ten o'clock from the Technical Schools, via Garstang, Lancaster, and Milnthorpe.

Bishop Auckland, Darlington, and District M.C.C.

The annual meeting of the above club was held recently at the Fleece Hotel, Darlington, and was followed by the annual dinner, which was attended by a good number of members and friends. The captain—Mr. W. Swan—presided. During the evening the prizes won during the season were presented, and some splendid songs and recitations were rendered.

Doncaster and District M.C.C.

The annual dinner took place on the 7th inst., followed by the presentation of prizes, Messrs. T. H. Dunstan, E. Gault, G. Brechley, E. Lee, T. Dunk, L. Baker, J. A. Bassett, E. Brock, J. S. Smith, C. Barnsdale, E. A. Scott, T. H. W. Dew, A. D. Robinson, J. Haslam, and W. Skidmore being the principal winners. It was suggested that the club should amalgamate with the Doncaster and District A.C.

Cambridgeshire M.C.C.

The club annual dinner was held on Tuesday, December 12th, at headquarters. The president (Councillor G. O. Palmer) occupied the chair, and there were over fifty members and friends present. The menu card occasioned much amusement, being couched in motoring terms. Consumption trial for cylinders of any capacity: Lap 2, boiled halibut (enders); lap 6 (runabout), cheese. The prizes for the winners of competitions during the season were presented. The title to hold the President's Challenge Cup this year goes to Mr. H. S. Wallis. Other prize-winners were Messrs. C. W. Wilson, A. B. Hurry, F. Malt, F. T. Cox, and H. J. French. During the evening the hon. secretary was the recipient of a handsome clock, a present from the members of the club as a mark of their appreciation of his secretarial work.

Bristol M.C.C.

This club, only a fortnight old, held its first monthly meeting on the 12th inst. at headquarters, the Queen's Hotel, Clifton, with a splendid number in attendance. The chief business was the election of new members (of which there were nearly thirty), also the election of the committee, and the arrangement of dates for various fixtures. The club has decided, after due consideration, to affiliate to the A.C.U. Mr. P. Grout, of Warmley, near Bristol, has been elected to the post of hon. sec.

SUTTON COLDFIELD A.C. TWO DAYS' RELIABILITY TRIAL.

(1) W. H. Eggington (Zenith and sidecar) and H. Goodman (3½ h.p. Corah-Jap) starting.

R. H. Viggers (Enfield), Seymour Smith (Norton), and James St. John, the trials hon. sec. (Triumph), being started by Mr. Philip Mosedale.

Club News.—

Denton and District M.C. (Lancs.)

The first meeting of this newly formed club was held at headquarters, the King's Head Hotel, on the 12th inst. Those wishing to become members can obtain full particulars from the hon. secretary, Mr. G. Harrison, 267, Stockport Road, Denton.

Harrogate and District M.C.C.

The winter reliability trial will be run on December 27th (Wednesday), and will follow the same course as the A.C.U. used in this year's April Quarterly Trial, viz., Harrogate, Thirsk, Sutton Bank, Helmsley, Pickering, Whitby, Saltburn (via Coast Road), Stokesley, Thirsk, Ripon, and Harrogate—146 miles in all. The speed schedule will be eighteen miles per hour for solo machines and fifteen for passenger machines, which must carry passengers of at least eight stones. There will be eleven known checks only.

Dundee and District M.C.C.

The annual smoking concert and presentation of prizes was held on the 6th inst. at the Queen's Hotel, Dundee. A very good programme made the evening most enjoyable. The prize winners were as follows: Single-cylinder lightweights, J. Thomson and H. Drummond; single-cylinder heavyweights, T. Gunn and Douglas Scott; twin-cylinder lightweights, G. E. Whitehouse; twin-cylinder heavyweights, D. Forrester; passenger machines, J. Forrester and S. J. K. Thomson.

A pleasant surprise was created by the Chairman when he announced that he would present another silver cup and gold medal to replace the one which has been won outright. He also announced that Mr. Douglas Scott had presented the club with a very handsome silver cup. The donors were duly thanked for their liberality.

Sheffield and Hallamshire M.C.C.

A reliability run will be held on Tuesday, December 26th, 1911, to Bridlington and back. Route—outward: Tinsley, Rotherham, Doncaster, Selby, Market Weighton, Driffield, and Bridlington. Return: Bridlington, Driffield, Market Weighton, Selby, Doncaster, Rotherham, and Plummer's Hotel (Tinsley). Starting point, Queen's Memorial, Fargate.

Speed at which each competitor must travel will be twenty miles per hour for solo machines and twin-cylinder passenger machines; sixteen miles per hour for single-cylinder passenger machines. Other fixtures are:

Dec. 28th.—First Re-union at the Glossop Road Baths.

Jan. 18th.—A Social Meeting at headquarters

Coventry and Warwickshire M.C.

It has been arranged to hold a winter run on Saturday, December 30th, to the Dun Cow Hotel, Dunchurch. A party of members will leave the railway bridge on the London Road at 3 p.m.

Another case in which one of the members—Mr. Gilbert Spicer—was involved in county court proceedings was promptly brought to the notice of the R.A.C. and A.C.U. with a view to the governing bodies defending Mr. Spicer under the affiliation agreement, and the committee is glad to report that the solicitor instructed by the A.C.U. was again successful in getting the case dismissed.

The question of road improvements and the removal of dangerous corners has engaged the attention of the committee, and the Roads Improvement Association has been notified of the inadequacy of the danger signs on the Holyhead Road, Coventry; also of the need for some improvement at the dangerous corner in Kenilworth.

The provisional date for the annual dinner and prize distribution is Friday, February 2nd. It will be held at the Masonic Hall, Coventry.

WINNERS OF THE CIRCUIT DE MELUN ROAD RACE. (See last Thursday's issue, page 1376.)

1. Dacier (Alcyon) first in Class 1; time, 3h. 51m. 58's.; also first in the general classification.

2. Fav (Rene Gillett) who proved the winner in the 4th Class.

3. La-roix (Peugeot) winner of Class 2; time, 3h. 39m. 18s.

4. Dubost (R. Gillett) first home in Class 3 and fastest time of the day.

THE party consisted of three — W, the proud possessor for the past ten months of a second-hand motor cycle, alleged to develop $3\frac{1}{2}$ h.p. at a certain number of revolutions, at present unknown; L, who had shared the joys of the aforementioned mortal and machine, sometimes in the saddle, sometimes on the carrier, sometimes (mostly) in the garage, who aspires to grovel around a machine of his own so soon as stable room is found; and A, who has not yet tasted the delights of driving and control, but in whom W and L are working up fiery enthusiasm, such as they themselves have.

It was only natural that A, after a ride on the common carrier, should desire a country trip in a sidecar; it was equally natural that L should offer his services as hirer, driver, and repairer of the sidecar machine; and W found it his bounden duty to accompany the venture in the capacity of general adviser and road clearer.

So it came about that they took delivery for a week-end one recent Saturday morning of a motor cycle a little more ancient than W's, and of equally obscure power, to which was attached a brand-new sidecar. As it was L's first attempt at sidecar driving, he approached the combination with some misgivings, some of which were present in the mind of A, who took his seat in the chair for the preliminary canter

with about as much ease as the dentist's chair is taken by a man with an aching tooth.

Setting the Course.

After explicit and detailed instructions from W—who, by the way, is a stranger to the saddle of the sidecar machine—the affair, with L and A aboard, was pushed off. The course was kept due east for thirty yards, after which it suddenly veered to south-east by south, with L looking helplessly at his front wheel, in spite of all W's instructions. The kerb brought the first ride to a sudden stop, with nothing worse than a slipping round of the front frame clip; this was remedied with a spanner, and the sidecar wheel was pulled in nearer the cycle, as L complained that the existing position forced the steering round to the right. W looked from L to the wheel with doubtful eyes, but suffered the adjustment in silence.

At the next essay, before which A asked if he was expected to occupy the sidecar seat, the machine was kept to the crown of the road fairly successfully, and after rounding three corners L was given his pilot's certificate and more advice, and a start was made.

The objective was a point seventy miles from London, and the official time for the word "Go"

A TRIO'S TROUBLOUS TRIP. BY "FAF"

was to have been eight o'clock, but it was 9.30 before the lessons and preparations were over, and a push-off given by the worthy owner of the passenger machine. W wisely

kept himself and machine to the rear for the first mile or so, his attention divided between well-watered tramlines and the hairbreadth escapes of the sidecar wheel with carts standing on the near side of the road.

Poor "A" Sees Sparks.

At the first hill the sidecar machine jibbed, and L reported that the engine was misfiring. If had a magneto fitted, with which useful contrivance none of the trio had had any experience during their career, but W had seen the owner detach the dust cover from the contact-breaker to examine the points that morning, so with great dignity he bent down and did the same. The platinum tip on the rocker was pronounced to be loose, so it was decided to put up with the misfiring until a repairer could be found, but it got worse, and another stop was called about a couple of miles further, when L thought it time to show a little reasoning, so he took out the plug to try the spark, poor A being told off to hold the plug on the cylinder with a piece of rag while L pedalled. A spark must have been a new sight for the plug-holder, for he yelled with joy when he saw it occurring.

A passing motor cyclist was allowed to look at the contact-breaker; he would not commit himself, as he also had only used accumulators, but he thought the loose contact was the cause of the trouble.

They Dunno Where They Are.

The machines were started once more, but the route was lost, A being too nervous in the sidecar to study the map that had been given him at the start. The machine was left at a repairer's about eight miles from the commencement of the run for a rivet to be put in the contact-breaker, while the party adjourned to discuss a little refreshment and the chances of reaching their destination.

The offending contact having been righted, a trial was made on the stand, and the machines once more led forth to the highway. A push-off was given to the sidecarists by W, upon whom the post of starter had devolved, but not a solitary explosion rewarded his exertions. Back to the garage went the procession, where it was found that the contact-breaker could be turned by hand whilst the engine was stationary.

The offer from the mechanic to correct this peculiarity was gently declined, as payment for the last fifteen minutes' task had been made at the rate of 6s. per hour, and the three travellers settled

A Trio's Troublous Trip.—

themselves comfortably by the roadside and went for that magneto. Off came the timing gear cover, a piece of wire was poked vainly through the compression tap to find the top of the stroke, so out the automatic inlet valve had to come, when the piston could just be discerned; the contact-breaker was moved round into the most likely position, and the nut on the driving end of the magneto was tightened. On went the timing cover, inlet valve, and carburetter, and the engine was tested on the stand, the only result being a few half-hearted explosions, occurring, it was judged, somewhere during the exhaust stroke. As none of the amateur repairers could find out how to see the platinum points break whilst the dust cover was in position, they were rather surprised that they got a bang at all.

Larks with the Sparks!

Off came the timing gear cover again, but the nut on the magneto had been so well fixed by A that the wheel could not be loosened on the shaft. Here was a quandary, until in a happy moment A spied the intermediate pinion as a solution to the difficulty. The wheel was gingerly withdrawn, and W nearly contracted brain fever in a futile effort to work out the direction in which the magneto had to be turned; it was moved round four teeth, and the engine tested again, to fire in a worse manner than before. Back came the pinion eight teeth, and was altered yet again before being passed as satisfactory. It was a treat to hear the engine roar, and the amateurs must be pardoned if they patted each other's backs. All tools were bundled away, and the journey was resumed at half-past two—five hours on the road, and still in the suburbs!

Off She Goes!

W now took the lead, with an occasional look behind, where a cloud of dust denoted the progress of the sidecar. It was hoped that all trouble had been surmounted, as about thirty miles had been covered without serious mishap, when W came upon a spot where the road divided, and decided to wait for the sidecarists. After exhausting his patience, his tracks were retraced for four miles, and, breasting a slope, he came upon the other two sitting by the road, looking disconsolately at their machine.

"What's up?"

"Engine seized," answers L, laconically.

The engine pulley was immovable, so W obtained some paraffin, which was poured into the cylinder *via* the valve port with the aid of a funnel and the head lamp gas tube. This having no effect beyond making three pairs of hands fearfully dirty, it was voted to have the cylinder off, but as the piston had stopped well up in its stroke it could not be accomplished without the removal of the whole engine, with magneto, from its cradle.

This being done, it was placed tenderly on the grass and the cylinder withdrawn, when the piston was found to be in its normal free and oily condition. "Main bearings," said one; "Big end," said another. So there was nothing for it but to take the

crank case apart, and an onslaught was made upon the pulley, which stoutly resisted all attempts at its removal, which is not to be wondered at, as it was afterwards found to be screwed on the shaft.

Our Way of Thinking.

At this stage a council was held, and it was agreed that the matter had got beyond the scope of the party. The engine was placed in the sidecar, together with a quantity of loose bolts and parts which had been steadily accumulating around the open air garage, and the whole pushed to an adjacent village, where the smithy was found shut up and the only man who knew anything about motors away; but there was plenty of help, it seemed, at a town two miles distant.

Another council was held, which ended by L and A going to engage a room at an inn, and W placing the cylinderless engine, with magneto attached, on his common carrier, and making his way in the gathering gloom to the town of hope, steering the throbbing machine with one hand and steadying the load on the back with the other. Arriving, he dismounted at a large garage, explaining the position and trouble to the gentleman who sauntered up, cracking and eating nuts with great relish. He remarked that the two mechanics had gone home and nothing could be done there before Monday, which was not very cheering news.

Sadly W wended his way onward, until a smaller shop up a side street was discovered, where he received help and sympathy, and operations were begun at once on the erring engine. A wire was sent to the people with whom the party would have lodged, and a return made to the village, where a welcome tea was consumed, the events of the day reviewed, and tracks were made for bed. Thus ended the first day of a trip that should have been so notable.

So Early in the Morning.

Next morning a visit was paid to the good repairer, who showed the astonished W the connecting rod bent almost to a right angle about two inches from the big end. It appeared that the gudgeon pin screw had worked loose and fallen into the crank case, being jammed between the rod and flywheels, stopping the engine dead whilst travelling at a good speed; hence the rod's spinal curvature.

The curving piece was heated and carefully beaten, but it began to crack on the inner side of the arc, and with this ended the expectations of continuing the trip that day. The sidecar machine was pushed the two miles to the yard of the repairer, and arrangements were made to send down another connecting rod and drive the combination back to London at a future date. W bade good-bye to his friends, and had a faultless run home on his beloved mount, leaving L and A to make their way to the railway station, sadder and wiser men, L to call upon the owner of the machine and sidecar to explain matters, A to return to the bosom of his family, his petrolic enthusiasm not only undiminished, but even increased.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

London to Devonar (Cornwall).

Q Will you please give route from London to Devonar in Cornwall?—G.H.

Your best route would be as follows: Brentford, Hounslow, Staines, Egham, Bagshot, Blackwater, Hartley Row, Basingstoke, Whitechurch, Andover, Amesbury, Hindon, Wincanton, Ilchester, Ilminster, Chard, Honiton, Exeter, Crediton, Bow, Okehampton, Launceston, Bodmin, Fraddon, Ladock, Truro, Devonar. You will find the Devonshire roads rather bad at present. The road given from Exeter to Okehampton is the least hilly, but a better surface will be found on the main road.

Overheating.

Q My 3½ h.p. always overheats. The compression is fairly good, and I have just had new piston rings, valves ground, and engine cleaned, but to no purpose. I have tried different jets, also different petrol levels, but find a very big jet (enlarged .034 B and E.) and air opening filed out to suit gives best results. To my surprise, the petrol consumption is much larger on a little jet than on a big one. The engine knocks long and often on the little jet, but not so much with the big one. The timing of the valves and magneto is as set by the makers. I have cleaned the silencer, and also tried open exhaust. The valve tappets are close up to the valve stems. I can just get a piece of notepaper between when hot. The gear is 4½ to 1—the lowest I can get with adjustable pulley. I can get up Edge Hill on the above gear if I cool down and fill the valve caps full of water before I start up, but I could not get up half-way if I took it without cooling down, etc. The exhaust valve is much smaller than the inlet. Would this make any difference?—G.L.

Without examining your engine it is impossible to say definitely. We should advise you to look to the cam gears, and see that the exhaust valve lifts at least a quarter of an inch. Then see that the magneto is correctly timed. The points should open on the top of the compression stroke, with lever retarded to nearly its full extent. A gear of 4½ to 1 is certainly too high. Running with magneto retarded will always cause overheating. If these suggestions fail we should advise you to visit the makers and consult them.

Licence for Sidecar.

Q I purchased a motor bicycle and sidecar this year, and on applying for the usual £1 licence observed that a further 15s. licence was required for a "carriage drawn by a motor car," and in the margin of the form it was stated "including sidecars and trailers used with motor bicycles and tricycles." As the date was subsequent to the 1st of October, two licences for 10s. and 7s. 6d. respectively were obtained. My sidecar is only used with my own bicycle; in fact, they are never used separately. (1.) Are two licences necessary, and what does the marginal note mean? (2.) Has any quotable decision been given on this matter? (3.) If the answer to my first question is in the negative, the form is misleading. Have I any redress? (4.) If the authorities press for a renewal in the new year, what is my best course?—SIDEAR, Peckham.

We should recommend you to take out the ordinary motor bicycle licence and no more. If the local taxation authorities threaten you, offer to fight. If they cave in, of course the point will be settled, but if they show signs of their willingness to go into the courts, communicate immediately with the Legal Department of the Auto Cycle Union (89, Pall Mall, S.W.), and they will tell you exactly what steps to take in the matter. The A.C.U. has long tried to persuade the authorities to allow one of these cases to go into the courts so that it may serve as a test case, but up to the present without success.

The new pattern Moto-Reve 4 h.p. twin cylinder V type engine with overhead valves.

Barrow-in-Furness to Plymouth.

Q Will you kindly give me a good route for motor cycle and sidecar from Barrow-in-Furness to Plymouth, *via* Castle Eaton—a small village midway between Fairford, Cricklade and Swindon? Is it possible for me to reach Castle Eaton the first day? Where are the best places to halt for the night, supposing I try to do the journey in three days?—C.M.W.

We have pleasure in giving you the following route: Barrow-in-Furness, Ulverston, Kendal, Carnforth, Lancaster, Preston, Wigan, Warrington, Tarporley, Whitworth, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Evesham, Stow-on-the-Wold, Burford, Lechlade, Castle Eaton, Cricklade, Malmesbury, Chippenham, Bath, Radstock, Wells, Glastonbury, Taunton, Cullompton, Exeter, Ashburton, Plympton, Plymouth. The distance would be approximately 427½ miles. It would hardly be possible for you to reach Castle Eaton on the first day, especially at this time of the year. We should recommend you to put up at Wellington or Bridgnorth the first night, Castle Eaton the second night.

Removal of Carbon.

Q Will you please answer the following questions: (1.) Would I obtain any better results by fitting two plugs in series, one having two poles? My machine is a 1911 free engine Triumph. (2.) How much would a plant for decarbonising cylinders cost? Could I have my cylinder done locally? What would the charge be, and where could I have it done? (3.) Are there any disadvantages in fitting Bowden magneto control and XL All saddles?—T.M.H.

(1.) We do not think you would obtain very much better results by fitting a two-pole plug. If, however, you care to make the experiment try the Lodge. A two-spark magneto is now made by the Bosch Magneto Co., who claim that an ordinary magneto used with a two-pole plug is likely to cause damage to the armature winding, and if you fit a two-spark magneto two ordinary plugs are all that are required. (2.) These outfits are not sold to the public. Decarbonising is carried out by the Internal Combustion Engine Cleaning Co., Ltd., 3, London Wall Buildings, E.C. The cost is 3s. 6d. for a single-cylinder machine. (3.) No; the reverse.

Cost of Taking a Motor Cycle to Australia.

[?] Please inform me what taxes I shall have to pay to ride a 2½ h.p. Douglas motor cycle in Melbourne, Australia, and what duty on landing. I have been riding it here since September last, so it could not be called a new one. I only want to take it for my own use.—A.J.T.

The duty you would have to pay would be twenty per cent. *ad valorem* for a machine of British manufacture, accompanied by a preferential certificate. We reckon the value would be the existing value of the machine. Full particulars can be obtained from the Government Offices of Victoria, Melbourne Place, Strand, W.C. The registration is 2s. 6d., driving licence 2s. 6d., obtainable from the Commissioner of Police, Melbourne. Both these licences are renewable annually as the driving and Inland Revenue licences are in England.

A Novice's Queries.

[?] I am desirous of purchasing a reliable and powerful motor cycle, capable of taking a sidecar over Devonshire roads. (1.) Do you consider a 3½ h.p. single-cylinder with change speed strong enough for the work I want it for? (2.) If so, which of the following would you place first: 1, Bradbury; 2, New Hudson; 3, James? (3.) With a two or three-speed gear is the engine very liable to get over-heated driving on hilly roads with a sidecar? (4.) In buying a sidecar, do you advise buying it from the same people as supply the motor? (5.) As regards the merit of chain or belt drive, do you consider the former has been so perfected that a novice can embark on one without fear of constant trouble? (6.) I am told that the latest form of Bosch waterproof magneto ignition is as near foolproof as it can possibly be. Is this correct?—NORTH DEVON.

(1.) 3½ h.p. would be hardly enough for Devonshire roads; 5-6 h.p. would be better. (2.) The machines mentioned are of equal excellence. (3.) Not if the engine is driven carefully, and throttled down when on the low speed. (4.) It would certainly save trouble if you bought the sidecar from the same people who supply the motor bicycle, and got them to fit it. (5.) We have no hesitation whatever in recommending chain drive if a sidecar is used. It should give no trouble even in the hands of a novice. (6.) You are quite right with regard to your remarks concerning the new Bosch magneto. The latest type magnetos have been rendered wonderfully simple, and practically weatherproof, but we recommend a shield to protect them from mud.

READERS' REPLIES.**Rust and Enamel.**

"G.D." is worried with rust on enamel. I think if he will follow these instructions he will get good results. Rub all rust marks bright with fine emery cloth, get a little white lead, and mix with turpentine, and paint all bright spots with same and let them dry properly, then paint with Velure (two coats), and he will find this will last as long as stove enamel.—J.H.C.

With reference to the query of your correspondent "G.D." in your issue of the 7th, we gather that he has used an enamel on his motor cycle frame, which has chipped off and subjected the bare metal to rust. Where uncovered, rusting, of course, is inevitable. We understand that this enamel is not Velure. Had it been, it would not have chipped off. He says, however, that he did use Velure once on a machine, and that spots of rust worked through. Whilst this is the first case of the kind we ever heard of, it is easily explained. The rust was there when the Velure was put on. Had "G.D." taken care to sandpaper it off thoroughly before applying the enamel, rusting would have been made impossible except by the enamel wearing through or being scraped or scratched off, because Velure is perfectly impervious to moisture, protects the metal, and prevents corrosion, whilst its flexibility is so great that, though of course it can be scraped off, it will not chip or crack if applied exactly as we send it out.—C. CHANCELLOR AND CO., LTD.

EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"W.C." (Farnham) desires owners experiences of the A.C. sociable.

"D.C.P." (Glasgow). Jones and Cowey speedometers.

"H.S." (East Kirby).—Scott with sidecar, reliability and upkeep.

"A.S." Ballinasloe).—5-6 h.p. four-cylinder F.N., general reliability.

"R.S.C." (Liverpool).—Albion two-speed free engine hub, or Millennium ditto, used on 6 h.p. machine.

X.Y.Z. (Land's End).—Humber runabout or other four-wheeled light car. Speed and reliability.

**THE HANDY SIDECAR.**

Mrs. Carside (to husband who has volunteered to run her into the nearest town to get a few things for Christmas): "Now, dear, if you can manage Pompom and the wooden horse, we'll pop off home."

AMONG THE ACCESSORIES.

A New Sparking Plug.

The Forward Cycle Co., 9, Edmund Street, Birmingham, have just introduced a new sparking plug, the electrodes of which are somewhat differently shaped from those usually employed. It will be

Forward new design plug.

noticed on reference to the sketch that the pointed earthed electrode passes through the centre of the insulated one which is formed circular, the sides being coned so that the portion nearest to the pointed electrode is thinner than the remainder. The makers inform us that they have been testing this plug for some time on several machines, and that it enables much easier starting. It is also claimed that it provides more power and cannot soot up. The firing points are made of pure nickel.

Belts and Bad Weather.

The correspondence on the above subject has attracted the notice of the Basilica Manufacturing Co., of Conduit Place, Spring St., W., who send us a sample of a belt which they claim is absolutely unaffected by any kind of weather, and wet weather in particular. The belt is built up of loops of leather so

folded that the end of one loop will fit between the jaws of the loop preceding it. Strong copper rivets are used to connect the loops, and $\frac{1}{8}$ in. washers on the top of each rivet serve to keep the

A SIDECAR FOOT-WARMER.

Introduced by Messrs. Brown Bros., Ltd., Great Eastern Street, E.C. The heater takes the form of an oblong box, the exhaust gases being conducted into it by means of a flexible metallic tube. It should prove a boon to all-weather sidecarists, and especially to competitors in the forthcoming winter runs.

belt from doubling up in the pulley grooves. The makers point out that the leather is not merely water-proof on the surface, but is specially prepared for resisting moisture.

Sidecar Foot-muffs.

A few days ago we inspected a foot muff intended specially for sidecar use. The Quidos as it is called, is made of stout brown canvas, edged with fur, and padded with very soft finely divided cork. This cork is treated by a special process to remove deleterious substances and to expand and soften the cells of the cork. This specially treated cork is used by the manufacturer of the muff in the stuffing of special mattresses. The advantages

The Quidos sidecar foot-muff.

claimed for the use of this particular form of padding are that it is not only extremely light, but absolutely water-proof, and at the same time very warm. The maker points out that air being the best non-conductor known, provided its movement can be prevented, the air locked in these enlarged cork cells makes it a specially good non-conductor.

The manufacturer referred to is Mr. Leoline Edwards, of 81, St. Margaret's Road, Twickenham.

Seasonable Gifts.

At this period of the year, the pleasures of giving are often seriously handicapped by the difficulty experienced in making an appropriate selection of the gift. In the wheel world this difficulty is quite as marked as in any other sphere of life, but it should be considerably eased by a perusal of the motor cyclist's

Another design of quickly detachable sidecar fixings, marketed by Scott's, Halifax.

edition of the Brooks book. Herein, apart from saddles, will be found many clever and ingenious devices for the carrying of tools and luggage, just the very things the enthusiast will appreciate. The address of the firm is J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham, and a request for the book will be answered by return.

We are in receipt of the list of S. Smith and Sons, 9, Strand, W.C., showing their latest type speedometers, lamps, and A.L. generators. These articles are suitable for those who wish to make Christmas presents to motor cyclist friends and acquaintances.

Brough Twin Engines.

W. E. Brough and Co., of Nottingham, are placing on the market two new twin-cylinder V-type engines, one of 6 h.p., 77 x 88 mm., and one of 8 h.p., 85 x 88 mm., which latter is the one being fitted to the new Brough runabout which is to make its first appearance in the London-Exeter winter trial. The

Timing gear mechanism of the new twin-cylinder Brough. It will be noted that the inlet and exhaust cams are directly over one another.

engines have a particularly neat appearance. The cylinders are very cleanly cast, and have good air spaces between the valve ports and cylinder walls. The rocker action for operating the side by side valves is unusual, and can be best followed from the drawing reproduced herewith.

R.A.C. Handbooks.

We are in receipt of the eighth volume of the R.A.C. Handbooks, published by E. J. Burrow, Cheltenham. This volume is devoted to the Great North Road and the Dukeries.

Awaiting your Acceptance at Morecambe.

"The Only Authorised AGENTS"—

The LONDON MATCHLESS MOTOR CYCLE AGENCY
184, Great Portland Street, LONDON, W.

PRICE'S MOTOR MANULAV

does not wash clothes, but it removes greasy grime in dirt from the hands in the most effective way.

The secret of its success lies in the way it is used. Rub a little of the half dry soap on the hands and work it well in before putting them in the water.

Remember! soap first, water to follow, and not much of either till the moment comes for a final sluice to wash off the lather.

Manulav is regularly used and appreciated by most of the motor cyclists who compete in the big events of the year.

Box of three large tablets, 1/-, post free.

PRICE'S PATENT CANDLE CO. LTD.,
BATTERSEA, LONDON, S.W.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor Street, E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

Northumberland, Cumberland, Durham, and Westmoreland.

York and Lancashire.

Camraron, Denbigh, Flint, Cheshire, Derby, Stafford Shropshire, Montgomery, and Merioneth.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

Worcester, Hereford, Radnor, Brecknock, Monmouth Glamorgan, Carmarthen, Cardigan, and Pembroke.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants Channel Islands.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

Somerset, Devon, Dorset, and Cornwall.

Scotland.

Ireland and Isle of Man.

THERE ARE NONE BETTER

and no lower prices possible than you will find in our great stock of nearly 250 Motor Cycles, including the latest 1912 models of all most famous makes ready for delivery now or at the opening of the 1912 riding season.

WAUGHOPES

9, SHOE LANE, FLEET ST., LONDON, E.C.

Wires: "Opifcer." Phone: 5777 Holborn.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, ad. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or it "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illie and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Brooklands and the Six Days' Trials.

IT seems likely that the Auto Cycle Union annual six days' reliability trial will next year be held in the West Country, with Taunton as a centre. In connection with the 1912 event, we should like to offer a suggestion with regard to the organisation of the trial which we commend to the consideration of the A.C.U., and that is to hold the last day's run on Brooklands in the nature of a high speed reliability test, with certain minimum set speeds for different sized engines. There is an old but true saying: "It is the pace that kills." It is a known fact that some machines, carefully nursed by competent drivers, can average 20 m.p.h. day in and day out, but if that same machine be expected to accelerate its speed for a long stretch, or increase its power output such as would be necessary were the owner to fit a sidecar, shortcomings in the shape of valve troubles, plug difficulties, and weakened compression will soon become apparent.

Further, what better advertisement could the manufacturer desire than that suggested? After having exhibited the hill-climbing abilities and regular running qualities of his machine to the thousands in the West Country, Friday's journey to Brooklands would open up and create interest in a new field, and on Saturday motor cyclists would flock to the track in their hundreds, and willingly pay an entrance fee to witness the speed test of the latest types of motor cycles exactly as they had been used for touring on the difficult roads and hills of Somerset and Devon. Again, on the final day of an A.C.U. trial the judges and officials usually have a busy and awkward task examining machines jumbled up in corners of an hotel yard, but

in the spacious paddock at Brooklands the machines could be ranged in proper order and the officials carry out their work of examination unmolested. Another matter which could be checked, and which makes the scheme still more worthy of consideration, is the oil slinging problem. On the examination day of a long distance trial competitors are usually to be seen actively employing their spare time cleaning away all superfluous oil, which, on some machines has an objectionable habit of finding its way through the crank case joints and past the oil pump plunger. In the case of hub change speed gears grease oozes from the hub and is flung on to the rear tyre and rim, and yet, with judicious use of a rag, all traces of foreign matter can be wiped away, and the judges are not aware that the engine had a propensity for covering itself with escaped oil. A very much more accurate result would be arrived at by demanding that the Brooklands test be completed without a stop to avoid loss of marks, and at the conclusion compelling each competitor to ride straight to the paddock gate, deposit his machine inside, and leave it there without having touched a single part.

Another point which appeals to us is the question of silencing. It is sincerely to be hoped that marks will next year be awarded to the most silent machines in the trial, and it is better that this test should take place on the last day. What better means of judging could be provided than Brooklands affords, with competitors careering round the track at certain set speeds and appearing at frequently recurring intervals?

We have endeavoured to show in recent articles that silence is not incompatible with efficiency, and that it is possible to design a really satisfactory silencer giving not only no back pressure, but even a suction effect.

MILITARY MOTOR CYCLING NOTES

BY "CELESTINE"

WHILST the Committee at the war office is still muddling along working out the future of what Lord Haldane calls the "Technical Reserve," two definite decisions have been arrived at and regulations framed which will interest all motor cyclists and those in the trade who employ motor lorries.

Motor Cyclists in the Territorial Army.

It has now been decided that each cyclist battalion may enrol seventeen motor cyclists, and that these are to draw a special petrol allowance of six shillings and sixpence a day during annual training. At the first glance this allowance may seem inadequate to compensate the motor cyclists for the wear and tear to their machines and for the running expenses entailed, but, as a matter of fact, this is by no means the case, and the allowance must be looked upon as a very fair compromise.

The Work of Motor Cyclists.

It is not as if the motorist were expected to be always on the go during the fifteen days he is in camp, for this is far from being the case. Generally speaking, the utmost mileage any motorist will be called upon to accomplish on duty during that period will be about 500 miles, so that the allowance works out at about twopence halfpenny a mile at the minimum, and in addition to this he gets a pound a year for the maintenance of his cycle, as well as his pay during camp as a soldier. During annual training there are usually three or four days when the motorist plays a very prominent part as the "Mercury" who links up the scattered columns of cyclists with each other; during this manœuvre or inspection period he may be called upon at any time of the day or night to go anywhere, and to go at top speed, and the success of the work accomplished by the regiment is very largely dependent upon the excellence of its motor cyclists, their grit, their ability to read a map, and their determination to "get there" at all costs and at best speed. There is a pleasing novelty about this work, because the police do not interfere to restrict the speed; there are, in fact, many cases on record of messages coming through at the rate of fifty miles an hour, and that means going "all out" when one takes into consideration the negotiation of villages and corners, and the necessity of consulting the map from time to time.

Taking it Easy.

At other times in camp the motor cyclists attached to cyclist battalions have a very easy time of it. They are excused from early morning parades, and, as often as not, they are told off under a senior motorist to go for a run round the country and learn the roads, whilst the rest of the battalion is indulging in musketry exercises or drills. For a man who owns a reliable cycle of 3½ h.p. or 5 h.p. the position is ideal, and I cannot conceive of a pleasanter way of spending a holiday. How many of us, when we take our annual holiday, find it hard to get congenial companions or to map out a pleasant tour that will accommodate itself to our pockets. Here we have all three problems solved for us: all our expenses are paid and a bit over, we are set definite tasks to accomplish a wheel, and if amongst the other sixteen

motorists we cannot find congenial companions, then indeed we must be hard to please.

The Conditions of Service.

We motor folk are an independent crew, and we have held aloof from Territorialism in the past because we imagined it meant a lot of silly drill, restrictions, regulations, and other vexatious items. I am not attempting to recruit my brothers of the wheel for the Territorial Army, let me hasten to say, but I am only giving a few plain facts for the guidance of those who feel that they might like to combine pleasure and patriotism. The motor recruit will have to put in forty hours' work during his first year of service—some twenty of these will be spent in learning the rudiments of drill just like any infantryman, but thereafter the remaining hours will be spent in the saddle or learning how to make maps, or attending other instructive lectures. In succeeding years only ten hours are required, and these will be spent almost entirely in week-end outings and such-like work. The motorist will have to attend annual camp for at least eight days, or furnish a sufficient excuse for exemption, otherwise he is liable to be proceeded against and fined anything up to forty shillings;

Military motor cyclists of the 6th Buff. Norfolk Regiment (Cyclists) Territorials at the Camp Ground, Great Yarmouth. From left to right: Capt. E. Dewing, Sergt. Major C. H. Vincent, Pte. T. Pechey, Lance Corp. Colls. Serg. Jenner. Four of the machines are 2½ h.p. Enfields, the other a Triumph. The former machines were presented to the Regiment by Mr. L. Ross, and all have done excellent work despatch carrying.

but such extreme measures are only taken in cases of obvious shirking on the part of the man. In return, the motorist receives two sets of uniform and the various emoluments detailed above; he enlists for four years' service, but should his civil work call him abroad he can get a free discharge, and—this by the way—a useful introduction or two from his officers or comrades. In camp the motor cyclists usually hobnob together and form a little clique of their own, for they like to confer with one another regarding the events of the day and to compare notes as to their various mounts.

Where to Enrol.

At the present moment there are eleven cyclist battalions in Great Britain, each consisting of 21 officers, 500 cyclists, and 17 motor cyclists, and in the course of the next year two additional battalions will be formed. The best procedure is to write a letter to the *Adjutant*, stating your address and asking for full particulars of local companies, for if you

Military Motor Cycling Notes.—

live some way from headquarters you will probably be attached to one of these. The age limits are seventeen and thirty-five, and the minimum height 5ft. 2in. The names of the existing battalions are:

Highland Cyclist Battalion; headquarters, Perth, N.B.
Lowland Cyclist Battalion; headquarters, Linlithgow, N.B.
Northern Cyclist Battalion; headquarters, Newcastle-on-Tyne and Durham.

Yorkshire Cyclist Battalion; headquarters, Park Street, Hull.

Norfolk Cyclist Battalion; headquarters, Norwich.
Suffolk Cyclist Battalion; headquarters, Saxmundham.
Essex Cyclist Battalion; headquarters, Brentwood.
London Cyclist Battalion; headquarters, Fulham House, Putney Bridge, S.W.

Kent Cyclist Battalion; headquarters, Tonbridge.
Devonshire Cyclist Battalion; headquarters, Exeter.
Welsh Cyclist Battalion; headquarters, Cardiff.

Each of these battalions recruits over a very wide area, and has local headquarters all over the country, so that, for instance, it is quite feasible for a cyclist living at Peterborough to join the Norfolks, or a Berkshire man to join the Londons.

Just one final word. Those motor cyclists whose knowledge of Territorials is limited to other arms of the service would do well to find out a little about cyclist work before they dismiss all idea of joining from their minds. The cyclists are admittedly the pick of the Territorial Army—physically, mentally, and socially—and their work is of the most interesting description, and is devoid of routine and barrack-yard work.

Motor Lorries.

The other interesting pronouncement I referred to at the commencement of these notes is the one to the effect that the War Office is now prepared to subsidise motor lorries, provided that on mobilisation the lorries could be at once taken over by the military authorities at a valuation. Such lorries are classed in two categories—(a) the heavy 5 ton lorry, (b) the light 30 cwt. lorry—and the subsidy varies according to construction from £8 to £20 per annum. Firms engaged in the motor trade may well think it worth their while to register some of their motor vehicles with the military authorities, for if mobilisation ever comes upon this country there will be little enough doing in all trades, and least of all in the motor trade, and such vehicles could well be spared. In the meanwhile the annual subsidy will help to fatten the yearly earning power of the lorry very considerably.

The Importance of Suitable Tyre Rims.

THE Manufacturers' Union recently decided to adopt a standard size and shape of rim for motor cycles, the sections of which were illustrated in *The Motor Cycle* of August 3rd (page 804c). The makers' decision was arrived at after considerable discussion and arrangement between various machine and tyre manufacturers; and we understand that no member of the Union will in future send out a machine the wheels of which are built with other than the standard rim. Complaints are constantly reaching us that covers which are not by any means worn through at the tread have a habit of bursting at the beads, and as the Manufacturers' Union has decided to adopt a standard rim to enable the various makes of tyres to be interchangeable, it is opportune to point out the unsuitability of some rims which, owing to their shape, do not allow the bead of the cover to bed properly into the groove. At Olympia we had an interesting talk on this question with a representative of Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester, who showed us photographs of several sections of actual rims which were submitted to

the cover is worn out, and is, therefore, a danger to be guarded against. Cutting above the bead is one of the greatest troubles experienced by tyre manufacturers, and Messrs. Bates say that they are convinced that this is only due to unsuitable and improperly shaped rims.

Reference should now be made to the appended illustration of sections of the rims which it will be noted are numbered from 1 to 7. No. 1 is known as the standard rim, and the tyres of all manufacturers who are members of the Union will fit this rim without cutting. Nos. 2, 3, and 4 are practically the same shape at the base but with different grooves for the beads. Now it will be obvious to almost every reader that covers which fit the grooves on No. 2 rim cannot possibly be correct for Nos. 3 and 4. No. 5 has smaller grooves for the bead than the standard rim, and Nos. 6 and 7 show a variation in pattern in the grooves of the same rim. It is very clear that a cover fitted to either of these could not prove satisfactory in use. What we think should be done now would be for either the Manufacturers' Union or the tyre manufacturers who are members of the Union, and who are agreed to a standard rim, to send out on application a small metal template with which motor cyclists could test the rims of their machines which were built previous to the decision to standardise one rim. By this means those who prefer to scrap their old rims and buy new ones could have the wheels rebuilt and so ensure accuracy of fit when the new covers of the standard make were purchased. The cost of the templates would be infinitesimal, and tyre manufacturers who were ready to send these out would doubtless increase their business by proving that they were not only ready but anxious to fall in with the Union arrangements.

PREPARATIONS FOR THE M.C.C. EXETER RUN.

The Rudge Co. left no stone unturned to enable clients of theirs who had entered for the above run to get through with a minimum of trouble and a maximum of light. For example, some of the machines were equipped with dissolved acetylene apparatus supplied by the Acetylene Illuminating Co., Ltd. The container for the compressed gas is about the size of an ordinary wine bottle, and consists of a small cylinder containing 5 cubic feet of acetylene and fitted with a valve to regulate the pressure. This was carried either on the top tube of the motor bicycle or in the sidecar chair. Other Rudge machines were provided with C.A.V. accumulator lighting sets, the batteries being specially made to fit in the sidecar between the back of the passengers' legs and the front of the seat. The electric lamps were special C.A.V.'s with metallic filament bulbs and lenses of the same size as those used for the small car lamps. Ordinary gas lamps with separate generators were carried as a stand-by by those Rudge riders who used electricity for illuminating purposes.

Sections of various wheel rims submitted to tyre manufacturers.

them, and some of which are in general use, or, to be more correct, were in general use until the Manufacturers' Union came to the rescue and standardised one shape of rim. Messrs. Bates showed us that unsuitable rims cause friction between the beaded edge of the cover and the groove into which it is supposed to fit. Finally this produces a cut just above the bead, so that no matter how strongly the cover is made, if an unsuitable rim be employed bursting cannot be prevented. This cutting and bursting takes place long before

Occasional Comments

by "Izion"

Belts—Ancient and Modern.

I can dimly remember what belts were like as far back as 1903, when I was using a powerful machine in hilly country, and it was by no means uncommon for a new leather belt to need shortening four or five times on each of its first ten outings, and then to collapse completely after from 250-500 miles. Latterly I have been using only good belts, both leather and rubber, of well-known makes and established design, which usually last about 1,500 miles with three or four cuttings, and seldom give serious trouble except in very bad weather. But I now realise that bad belts are still made.

A correspondent in the United States, who has done some riding in England, informs me that few American belts even distantly compare with the British article, and opines that the comparatively great popularity of the chain transmission in America is largely due to the extremely shoddy character of the belts supplied on many Yankee machines. I have also discovered that some British belts are tolerably shocking. I was sent a leather sample of fantastic and new design a few weeks ago, and in less than 200 miles' testing it broke four times, and stretched nearly 15 inches.

Oilskins v. Waterproofs.

I dare only enter the lists against the Dunlop Rubber Co. with extreme deference, but I believe I can inform them why the average rider is apt to prefer the smelly and shapeless oilskin, be it of subfusc or garish hue, to the neat and dapper tailor-cut waterproofs. The main reason is that oilskins are much cheaper. A couple of dollars will rig one out in oilskins, whereas a neat rubber-proofed suit will not leave much change out of a couple of sovereigns. This economy might not be decisive, for most men are semi-dandies at heart, and the jeers of the populace make it uncomfortable for a rider in oilies to dismount and wander about crowded thoroughfares in search of postcards, petrol, or pipe-fuel.

The balance is settled for ever by the fact that all waterproofs rip so easily, and as the average motor bicycle bristles with sharp corners, a wet weather suit is often slashed and gashed to ribbons before it is even one-quarter worn out. Further, waterproofs normally get ripped sooner than oilies; the pockets of rubberproofs are practicable, and one pushes a small screwdriver into the side pocket, only to see its blade protruding through the coat in a mile or two, while one's boot too often tears the neatly shaped gaiter at the second or third time of asking.

Oilies are such a slack fit that one could almost thrust a battering ram down the leg of an oilskin without bursting it. Finally, I must add, my experience is that oilies are more truly waterproof in a really heavy downpour than any rubbers I ever bought. A gorgeous fortune awaits the inventor of an *untearable* as well as absolutely waterproof suit for motor cyclists.

The Shaft Drive.

I suppose that on paper the shaft drive is probably ideal. It can easily be made almost as silent as a chain, it is absolutely weatherproof and simple to adjust, while it can be totally encased without disfiguring the machine (encased chains always look ugly). I see two main reasons why it is not largely adopted in actual use.

(1.) The general public are suspicious of it because they are afraid of the engine seizing or jamming. It is almost too positive, supposing any seizure occurs. Engine seizure due to under-lubrication need not be seriously considered, for it almost always occurs at quite low speeds, *e.g.*, in the effort of restarting when the engine is red hot, and no smash would follow, but a jammed engine might occur at speed, and with a shaft drive this would mean a very ugly tumble.

(2.) The advocates of shaft drive forget that it has never yet been applied commercially to a $3\frac{1}{2}$ h.p. single-cylinder engine with a high gear ratio of 4 or $4\frac{1}{2}$ to 1. A positive drive which is reasonably flexible with a low-g geared four-cylinder engine (existing patterns are geared $5\frac{1}{4}$ or 6 to 1), or with a tiny single-cylinder engine geared $6\frac{1}{2}$ or 7 to 1, would be intolerably harsh and jerky with a big single-cylinder engine geared 4 or $4\frac{1}{2}$. Before the shaft drive could be satisfactory on the popular 500 c.c. type of single-cylinder engine it would require a free engine clutch, and probably a variable gear, since a 4 or $4\frac{1}{2}$ gear is often too high for such engines.

By the time a spring drive, a clutch, and a change-speed gear had been incorporated on a comparatively heavy $3\frac{1}{2}$ h.p. machine, the shaft drive complete would both weigh and cost far too much for general adoption; and it is not probable that it can become universal until a very distant future.

James H. Locke, of Toronto, who has written in high terms of praise of his $3\frac{1}{2}$ h.p. Ariel. He exchanged an American twin-cylinder for it.

THE DIARY OF A TOUR.

A slight sketch of a motor cycle holiday indulged in by a few members of the Glasgow M.C.C., July, 1911.

SOME weeks before Glasgow Fair, the Captain asked the President if he cared to join "H." "S." the Secretary, and himself in holidaying as far as London, and taking in Scarborough on the way. The President was more than charmed, and found the party had swollen to seven in number at the start. Sandyboy and the President arranged to leave Dickie's Garage at 10 a.m. sharp on Friday, the 14th July. As is usual, and apparently inevitable, with motor cyclists, it was fully an hour later before the pair cleared the Western Road on their way South. The rendezvous for the day was the Red Lion, Carlisle. Sandyboy and the President journeyed *via* Lanark, where a call upon Ewen's School of Flying was made, and a pupil of Mr. Ewen's was good enough to show them over the hangar; the damaged Bleriot came in for close inspection. A jolly good lunch at Abington, and a non-stop run to Lockerbie, brought them to the King's Arms and draught beer, which was much appreciated in its native pewter. Carlisle was reached in good time for tea, and shortly after the Captain and "S." put in an appearance, having left the Southside Garage about four o'clock. At 9.45 "H." and the Secretary arrived. This couple left town at six something, and must have been doing 30 m.p.h. all the way. With the addition of the Doctor, on his 8 h.p. Rover car, the party was brought up to its full strength.

Carlisle to Scarborough.

Next day (Saturday, the 15th), the weather was again of the loveliest description, and all—with the exception of Sandyboy—streamed down the Botcher-gate and out of Carlisle, as usual, an hour late. A fine view of the mountains of the Lake District was had on the way down to Penrith. The route then lay South-east, by Appleby, Brough, and Bowes. Bowes gave a homely lunch at rs. 6d. per head. Resuming, the cyclists went on to Scotch Corner, where a very happy interlude took place, and the meaning of "Scotch Corner" was explained by a rotund, jolly farmer. It seems, in the old coaching and cattle driving days, that the straight road or street made by the Romans was abruptly left at this point by those travelling into Scotland. A hearty "Good-bye," and away down the Great North Road. Turning off to the right, the run continued through Ripley and Ripon to Harrogate. The White Hart was excellent, and the bill was quite up to the standard of a first-class hotel. "S." made disparaging remarks about the height of the bill, and wanted to know if this was touring at 6s. 6d. per day?

Sunday (16th) morning saw a late start—as, indeed, every effort in this way was. Through Knaresborough the party went to York, where they had a good lunch at Harker's. Some time was devoted to the Minster and the older parts of this historical city, especially the Shambles, where the houses almost touch in the top storeys. *Viâ* Malton, the party went on to Scarborough, which was practically the Mecca of "H.'s" pilgrimage. Someone had told him that if ever he was within a hundred miles of Scarborough, not to miss it on any account. Down an exceedingly steep

street, with an awkward turn at the foot, the cyclists met on "the front," and, from the uncommon interest shown by the crowds, one would have thought motor cyclists were unknown in that quarter. Three times along "the front" looking for decent digs, but without avail, so a detour was made to the Pavilion Hotel at the top of the town. Here the party was done very well, and "S." took the credit, he having arranged terms at "H.'s" suggestion. Scarborough was disappointing, so every one agreed—the water dirty, sands dirty, shops cheap, and the frequenters in their thousands cheaper.

Scarborough to King's Lynn.

Next day (Monday, 17th), off by Filey Bay to Bridlington, and the Keys Hotel, Driffield, for lunch. "Could you wait until something was cooked?" "Yes, we'll wait," and so up came a couple of ducks, garnished with green peas and other good things, to which full justice was done. Out into the sunshine and off to Hull. A slight and grateful shower fell as they were passing through Beverley and Hull. At the latter town "H." came a cropper trying to avoid a dog. An exciting quarter of an hour was given to all while the Doctor's car was being put on board the steam ferry for New Holland across the Humber. Thanks to a friendly local motor cyclist, who also crossed to New Holland, the party were put on the right road to Brigg, the darkness having fallen by the time the passage of the Humber was made. At Brigg the Angel proved all right, and the bill was far from high, so off went the party next morning (Tuesday, 18th) in great glee. Running down the perfectly straight street of the Romans known as Ermine Street, they had a fine view of Lincoln Cathedral for many a mile before arrival. After a drink or two with the friendly motor cyclist—who, by the by, had waited at the Angel and been the convoy—the Cathedral was visited, and so also was the Castle. The view from the Observatory Tower was very fine indeed. Many, many miles the eye could range over the Fenland, and the old red pantiled roofs immediately below gave the necessary touch of colour contrast to a glorious picture. The Saracen's Head put up a fine cold salmon lunch, and coffee, choice cigars, and fine old crusted port were the order of the hour. Here the Doctor had perforce to leave for home, and the parting at the railway station—where the whole party had gone to see to the President's bag being sent off to London—was affecting in the extreme. Sleaford was made, and by devious paths (where three went miles off their way) King's Lynn was reached shortly after lighting-up time.

Through East Anglia.

The following morning (Wednesday, 19th) was again favoured with ideal weather, and here another heart-breaking scene took place when "S." reluctantly took leave for home. By Dereham the four stalwarts went on to Norwich, and again did themselves well at lunch time. A brief walk in Norwich, and then on to Yarmouth.

At Ipswich a call was made at the Great White Horse Hotel (made famous by Dickens in his "Pick-

The Diary of a Tour.—

wick Papers"). After this the party proceeded on its way, and three of them (the Secretary, Captain, and President) proceeded off their way to the extent of eight miles there and back. However, a foregathering was made at the Cups Hotel, Colchester, for the night.

Next forenoon (Friday, the 21st) was given up to sight-seeing. The Museum, with its Roman finds, was of great interest; so was the great stronghold of a Castle, and the Roman Wall, said to be the finest example of its kind in Britain. The Secretary was parted with earlier in the day, as he, being so near home, was naturally anxious to be with his "ain folk," so the cyclists numbered only three. Passing through

and consequent heat made the change of raiment and locomotion appreciated. A 'bus saw the duc begrimed ones to Anderton's Hotel, and, their baggage being in-waiting, a complete change of attire was made; and, with the purchase of three straw hats, the effect, no doubt, was very striking and, it is to be hoped, pleasing to the natives of London town. After dinner the proposal, "Let's all go down the Strand," was made, and the Pavilion Lounge found the three in great form and in congenial company—especially "H." and the Captain having the time of their lives. The hour of retiring to bed must not be divulged.

Next day (Saturday, the 22nd) saw the three finalists ready to start for Brooklands by train, with an addi-

(1) Tyre repairs near Swaffham.
(2) Opposite Harker's Hotel, York.

(3) Good-bye!
(4) A Lowestoft.

Chelmsford, the Captain and the President partook of a humble bread, cheese, and beer lunch—"H." having gone astray. The North of London was skirted by Ongar, Epping, and Enfield to High Barnet. At this point, which had been fixed upon as convenient to leave the cycles, a little difference of opinion took place, and "H." dashed off towards London on his own, with the President in close attendance and the Captain whipping in. A Rudge-Whitworth agency in Holloway Road was made the garage. It was a relief, after eight days' riding by this indirect but charming route from Glasgow to the Metropolis, to doff our overalls for a day or two. The continuous sunshine

tion in the person of one well-known to "H." and the Captain. Twenty miles by rail, and a short walk to glorious Brooklands. An hour's wait, and Beaumont rose gracefully and speedily flew over the heads of the assembled thousands in the direct line for Hendon. Védrines and Hamel followed in quick succession. The party saw Lieutenant Porte come a nasty cropper, but, luckily, he was uninjured, and got a great ovation over his miraculous escape.

Next morning (Sunday, the 23rd), the President was astonished to find the Secretary had spent the night in the hotel, having been met by "H." in the Empire lounge and carted home to Anderton's. The party,

The Diary of a Tour.—

with this augmentation, went to Hampton Court and on the river, which was a ravishing sight. Paddling up and down the river for three hours was great enjoyment, and also some concern and amusement to others when the Captain or President was at the head of affairs with the paddle. The return to London was made by train.

A Start for Home.

Monday (the 24th) saw the President, Captain, and "H." again in overalls, and a start was made for home. This day's run is worthy of note in so far as the only lady motor cyclist the party had the pleasure of seeing in all this tour was met.

Next day the party went through Northampton, where "H." was in real trouble with his back tyre. However, he managed to keep going through Market Harborough to Leicester, and finally Derby. This was a sore day for friend "H."

Wednesday (26th) saw a new tyre on (at wholesale price, 30s. 2d.), and happiness reigned supreme over all. The way lay by Belper, where the River Bath proved too seductive for the President and Captain, so "H." kept on alone. The party was now a mere skeleton of its former self, being reduced to two; but these two were well met, and didn't care a button when they got home—a 100 miles a day was to their liking. The River Bath was no success—there was too little river. The Peacock, near Haddon Hall, gave a nice lunch, and the cigar in the garden was unalloyed joy. Past Haddon Hall, on to Buxton, and away for Manchester went the pair. The Captain had some bother with his exhaust cable, and decided fifteen miles short of Manchester to have it made right once for all, so the President went on, on his trusty Triumph alone, and bumpity-bumped it into Market

Street, Manchester. At the base of a statue sat the President, who looked like a tramp, but, careless of appearances, smoked his cigar, read his afternoon paper, enjoyed himself, and waited for the Captain. The Captain turned up all right, and Manchester was immediately left behind, and the two bumped on to Chorley for the night.

The following morning (Thursday, 27th) Kendal was reached for lunch. A slight swirl of rain—which was indeed refreshing—came on as the two inseparables entered Kendal, and became much heavier when lunch was being discussed. The rain was relished in a way, as it was practically the only rain that had fallen during the tour. At lunch the two were joined by a very talkative but withal gentlemanly man, who made the feeding hour pass very pleasantly. The road for the next twenty miles was greasy, but Ambleside saw sunshine and dry roads, and on the two sped to Keswick, Bassenthwaite, and Bothel, and ultimately Carlisle. The Captain, unluckily, had a puncture ten miles short of Carlisle, but it was soon located and mended.

Home Again.

Friday (28th) again broke fine, and a great run was made to Abington for lunch. Ewen's Aerodrome was taken on the way, and Glasgow was reached by the Clyde Valley. At Hamilton the Captain took the President round by Blantyre and East Kilbride, and by curious—very curious—paths to Carmunnock, where a call was made at Ferguson's Hostel. A glorious sunset was seen from the Carmunnock heights. A further call was made at "Wee Peggy's" at Queen Park Gates for cigars, and the never-to-be-forgotten tour of nearly 1,200 miles ended by the Captain and the President shaking hands "good-night" at Wee Peggy's door.

THE CAPE PENINSULA MOTOR CYCLE CLUB.

Some of the members gathered to celebrate the first anniversary on Tuesday, 21st ult., with the first annual dinner at Camp's Bay.

Cost of Running a Motor Cycle.

More Replies to a Reader's Query.

Sir,—The following may be of interest: Cost of upkeep for three Triumph motor cycles used by the Toronto Police during the season of 1911, from May 1st to December 1st. These machines are in commission daily, and are used for catching motorists who break the speed laws. The distance run was 20,525 miles, gasoline consumed 305 gallons at 20 cents per gallon, 61 dollars; 6 gallons of Price's A air-cooled oil, 14.25 dollars; average running per gallon, 3,420 miles.

The total cost for everything, including tyres, speedometers, and spares was \$188.05, or $\frac{2}{3}$ fraction of one cent per mile. A cent = about $\frac{1}{2}$ d. The machines have given such good satisfaction that a further order is expected. In all that running the machines were not out of commission a minute.

TANGENT CYCLE CO.

Toronto.

Sir,—My expenses list may be of sufficient interest to appear among your letters *re* cost of upkeep. The motor bicycle is a 1910 $2\frac{1}{2}$ h.p. twin of known make, and has been run under two years:

Total expenditure, including machine ...	£70 16 0
Motor sold for ...	£23 16 0
Sundry spares, tools, etc., not sold ...	9 0 0
	<hr/> 32 16 0

Net cost for 6,400 miles ... £38 0 0

Running costs (all) ...	£17 7 6 = .65d. per mile
Licences and insurance ...	4 10 6 = .17d. „
Depreciation ...	16 2 0 = .60d. „
	<hr/> £38 0 0 = 1.42d. per mile

A.F.W.

[The depreciation item is very heavy, and should not under ordinary circumstances exceed 20-25%.—Ed.]

Sir,—I have been very much interested in reading the letters *re* cost of running a $3\frac{1}{2}$ h.p. motor cycle. Perhaps my experience may be of interest to others. Most of your correspondents appear to have run their machines for "the season." I bought one second hand, which had done about 1,000 miles, for £34 5s. It had a two-speed gear in the hub. I commenced to run it in March, 1910, and exchanged it for a new one in May this year, being allowed £25 for it. It was in use practically every day, and often in the night, over highways and byways in all weathers. The total mileage was 10,000. I had all my repairs done at one garage, where I bought all I required.

I find that my bills total ...	£60 12 10
Licence and registration ...	1 5 0
Insurance ...	1 15 0
Loss on machine when exchanged ...	9 5 0

£72 17 10

I have in hand spares, lamp, tubes, and tyre ... 6 13 6

£66 4 4

= 1.58d. per mile.

Tyres were a source of trouble, not wearing down to the canvas, but hursting at the bead or getting badly gashed by stones. The gear also gave a lot of trouble, and once had to be sent to the makers for repairs.

I had not ridden a motor cycle previously, and had not time nor, I am afraid, ability to do repairs. The machine was ridden almost entirely for business purposes, mostly short journeys, rarely totalling 100 miles a day. Only on three occasions did I fail to complete my journeys. The purchase of the machine was an experiment, having previously done the work by horses and train. The result has been satisfactory. Of course, there was no snow to interfere with running last winter. If there is any this I intend to try and surmount the difficulty by using a sidecar.

From my experience, I should say that a motor cycle for rough every day work should have stronger tyres, bearings both to engine and wheels which would wear better, and the transmission should not require adjusting so often.

FIRST YEAR'S MAN.

Sir,—The correspondence you have published regarding the cost of running a motor cycle is most interesting. I must, however, take exception to the letter of "Viator," as being inaccurate and misleading. He claims to have run a 4 h.p. twin for five years for a total expenditure of £10. This is absolutely ridiculous. His licences and taxes, registration, etc., must have cost him £5 15s., which leaves £4 5s. for tyres, petrol, oil, repairs, insurance, and all the sundry expenses that occur from time to time, and this over a period of five years! I have had considerable experience of motor cycles, having owned six different machines, and say, unhesitatingly, that it is impossible to do what "Viator" claims to have done. I challenge him to publish his balance sheet.

VERITAS.

Sir,—I have read with great interest the many letters you have published on this subject, and must lay stress on the point of Mr. Pirie's letter that the mileage in some cases has not been sufficient to give a figure of any value. In the first place, I am a motor cyclist who visits the repairer as seldom as possible, as with many it is the small sums spent for having valves ground in, various little accessories fitted, and the machine cleaned after a muddy ride that run up the costs for the whole year.

From 1906 until this year I have ridden a $3\frac{1}{2}$ h.p., and it was not until after many days of persuasion and a trial that I ordered a 1911 $2\frac{1}{2}$ h.p., two-speed, chain-drive A.J.S., as I could not fancy that a $2\frac{1}{2}$ h.p. would have the reserve of power necessary for extensive riding. I was soon disillusioned, as one can maintain an average speed of 30 m.p.h. and climb any hill. I longed for a better transmission than belt drive, and the chain undoubtedly is better, as after 11,000 miles my original back chain is still in use, whilst the front one I renewed after 9,800 miles, eleven of the rollers having disappeared. Five times I have been stopped from transmission causes—three times for the small bolt coming out of the front chain, once the spring clip broke on the coupling link of the back chain, allowing it to slip out, and once the back chain was thrown off, as it was very loose, whilst carrying a passenger pillion fashion.

As regards treatment of the chains, I have three times taken them off, washed them in paraffin, and immersed them in hot gear grease, which seems to bring the dirt from under the rollers to the surface of the liquid; then, when the mass cools down, take the chain out just before the grease solidifies.

Again, the chain drive is considerably cheaper from the renewable point of view.

There is no getting away from the fact that a $2\frac{1}{2}$ h.p. is much cheaper to run than a $3\frac{1}{2}$ h.p., it being so marked when petrol and oil consumption and the economy in tyres are looked into.

I have just sold my machine, therefore the depreciation is actual, and the other costs shown below are grouped together as well as possible.

Cost of running $2\frac{1}{2}$ h.p. two-speed A.J.S. 11,490 miles.

Petrol consumption 137 m.p.g.:	
Eighty-four gallons of petrol ...	£5 1 0
Five gallons of lubricating oil ...	0 17 6
One T.T. Hutchinson tyre ...	£1 19 6
Tyre repairs ...	0 6 9
Extra for butted tubes ...	0 10 0
Repair outfit, patches, corset ...	0 5 3

Front chain, spare link ...	3 1 6
Valves, plugs, carbide ...	0 3 6
Licence, Inland Revenue, registration...	1 12 4
Lamp (Powell and Hammer), depreciation...	1 6 0
Overalls, depreciation ...	0 7 0
Hedging gloves ...	0 5 0
Overhaul, new piston rings, etc. ...	0 1 9
Sundries, tools, etc. ...	2 14 0
Depreciation on machine ...	0 9 6
	<hr/> 11 0 0

£26 19 1

This works out at approximately 0.562d. per mile.

BASIL ADAMS

A SIDECAR IN CORNWALL.

THE remarks under this heading should be left unread by all expert motor cyclists; their appeal is to the man of little knowledge who has visions of driving his friends about the country in a very inexpensive fashion, but regards sidecaring with suspicion as being difficult and dangerous, and thus foregoes the pleasures of motoring until he can afford to purchase a small car.

My experiences of motor cycling can claim only 5,500 miles, over 2,000 of which have been with a sidecar. I am of the type called in motor cycle circles "potterer"—in other words, I hate having to do anything save drive, and beyond mending punctures, shortening belts, and cleaning plugs and points, am more or less helpless. I have not the slightest desire to encounter the risks of taking corners very fast, and though loving pace on a broad road, a timed hill-climb would be anathema to me save as an interested spectator.

An expert and daring driver could ascend hills at which I should invariably fail, because he would attack them more boldly. Yet there are very few hills, un-

the gear has never given the slightest trouble as I have kept it well oiled.

Notes on Gears and Belts.

The low gear is not low enough to climb precipices or start on a very bad hill, and I am convinced that for the *complete* comfort of the "potterer" a three-speed gear is essential. But when one has only two speeds a lower low gear than the N.S.U. would mean very slow climbing on average roads; for the few occasions on which the gear is not low enough, there are many on which a lower would be a nuisance. After all, if one fails, the passenger can be put out or the driver run alongside, and at the worst both can get out, and, the low gear being engaged, the driver jog alongside briskly. I had only to do this twice—on part of the hill from the Logan Rock to St. Buryan and between St. Anthony in Meneage and Manaccan.

Many accusations have been hurled against belt transmission, yet there is no need for trouble if one uses rubber belts in dry weather and belts such as the Whittle in wet. The rubber belt stretches fairly

1. St. Mawgan Church, from the road to Mawgan Porth.

3. The Land's End (Peel Point).

less one looks for precipices, which worry me greatly.

My motor is a 3½ h.p. Triumph (1910 free engine), N.S.U. two-speed gear, and Gloria sidecar, and my experiences have been chiefly on the Dublin and Wicklow Mountains and about 700 miles in South Cornwall in August. Barring punctures, the only involuntary stoppages I have had are slipping belts (several), once for choked petrol pipe, and the last—the only mechanical breakdown I have ever had—broken crown spindle, the front axle going in consequence. It sounds very terrible, but we subsided quite quietly, and my passenger was not even jolted badly. Engine troubles have been completely absent;

often at first, but gives a sweeter drive; the leather belt is harder on the engine pulley and engine, but if kept properly dressed never slips.

If the potterer desires to explore hilly country, a two or three-speed gear is absolutely essential, unless the hills admit of rushing.

The Cornish Roads.

My Cornish experiences with a sidecar are almost completely confined to the Land's End and Lizard peninsulas, where there are comparatively few hills of single figure gradients, except on by-roads, and yet hardly a hill which one can take at high speed. The only two hills between Heiston and the Lizard

A Sidecar in Cornwall.—

are very good examples of the typical South Cornwall hill. A sudden descent, a bridge, a sharp turn to the right and a still sharper to the left, and an abrupt ascent. The gradients are not very severe, though I think the Contour Road Book errs on the side of leniency, but they are troublesome, because no potterer will drive very fast round a sharp left-hand corner, for the only disadvantage which I can see that the sidecar suffers from, as compared with the small car, is the risk of upsetting if corners on the sidecar side are taken too fast.

If care is taken on corners, the sidecar is as safe as any car. It is faster than the average small car, much safer in grease (for a rigid sidecar cannot side-slip), and costs in upkeep about one-third of an 8 h.p. car, which it can leave far behind.

Much has been written about the folly of pedals on a $3\frac{1}{2}$ h.p. motor bicycle—if you are going to attach a sidecar leave them on. There are occasions on which they will be found most useful, especially when one has to slow down on a hill on account of traffic. A few sharp turns of the pedals assist the little engine wonderfully and afford healthy exercise.

So far as my experience goes, it is almost impossible to over-lubricate a $3\frac{1}{2}$ h.p. engine when driving with a sidecar. Someone told me to increase the supply from one charge in fifteen miles when driving solo to one in twelve or ten when with sidecar. If the country is hilly, one in six is not a bit too much; one in eight is a good average, with a few extra charges thrown in on the bad hills.

A Few Hints to Sidecarists.

As there are possibly some readers of this journal who are less experienced than myself, the previous and following hints may be of use. If a hill is encountered on which the driver knows he must change down, always change before the engine slows down. I am dealing, be it remembered, with a $3\frac{1}{2}$ h.p. driven by a novice. Sharp left-hand corners should be taken slowly, but as closely in as possible, so as to use the camber of the road. A writer to *The Motor Cycle* recently drew attention to the excessive camber of the roads in Cornwall, and the difficulty thus caused when passing vehicles, especially without a passenger in the sidecar. My experiences coincide with his, for even with a passenger both of us had to lean out as far as possible on several occasions in order to avoid upsetting.

South-west Cornwall.

The possession of my "moke" afforded me the most delightful holiday I have ever had, bringing, as it did, South-western Cornwall to the doors of Carbis Bay, our abode during August. Then to the joys of the immediate neighbourhood of St. Ives—not least of which was the beautiful beach of Carbis Bay, safe, firm, and affording entrancing views—were added the joys of visiting what is to me the most fascinating and most unspoiled corner of England, magnificent in its rugged coast line, stern though relaxing at times into lovely coves where the tamarisk grows to the water's edge—a country which everywhere speaks of hoary antiquity by its many stone monuments of prehistoric times, and by its venerable churches, veritable haunts of peace, tells of the faith and hope of the days that have been, that are, and that are to be.

No 60 h.p. motor can bring the tourist to the finest coast scenery unless he is prepared to walk as well as to motor. If he is not afraid of some rough walking, a $3\frac{1}{2}$ h.p. motor bicycle and sidecar will take him about almost as well as the biggest car, the only difference being that the car will descend to a few places where the cycle is best left on the road or in a field above. It can be so left with absolute safety, for despite the Cornish reputation in the past for wrecking, a more honest or more kindly people does not exist.

Cornish Inland Scenery.

That the guide books are fair to the interior of the country I deny utterly. [We agree entirely, *e.g.*, the River Fal, the valleys of the Glyn and Camel, and all the neighbourhood of the Helford River.—ED.] The Lizard and Land's End peninsulas are full of wild moorland spots, painted with gorse and the glorious Cornish heath, of old-world villages, bleak and bare in the Land's End, clad with almost tropical verdure in the Lizard, such as Manaccan, where roses bloom in mid-winter. A country as yet untainted by civilisation, speaking by its many churches of its faith in God, and by the simplicity and friendliness of its people of its faith in man; its coasts presenting on the north cliffs which challenge the ravages of the Atlantic, on the south coves where island, jagged rock, and ultra-marine water combine to delight the eye far more wonderfully than pen can tell; such was revealed to me and to those whom I drove about by the aid of a motor bicycle and sidecar. C.B.

A REMINISCENCE OF THE SUMMER. Mine Host inspecting the steed at a wayside inn.

NEW BROUGH SOCIABLE.

A neatly-designed Chain and Belt-driven Three-wheeler with Variable Gear.

Broadside view of the new 6 h.p. Brough sociable.

LAST week we examined the first of a new pattern three-wheeled sociable which is being placed on the market by W. E. Brough and Co., of Basford, Nottingham, and which was to make its *début* in competition in a no less severe trial than the M.C.C. twenty-four hour winter run to Exeter and back. We were much impressed with the general design of the machine, which will appeal to that large section of non-active and elderly motor cyclists who desire something more stable than the motor bicycle for all-weather work, something more comfortable and cosy, and withal inexpensive in first cost and upkeep. The machine we examined was a 6 h.p. 77 x 88 mm. two-seater, but early in the New Year the 8 h.p. 85 x 88 mm. type will be available either in its single or double-seated form.

A Variable Pulley Gear.

The frame, which is suspended front and rear on semi-elliptical springs, is of pressed Vanadium steel; inswept at the front to enable a good steering lock. The twin-cylinder V type air-cooled engine is mounted in line with the motion of travel on two cross members immediately behind the front axle, and drives by means of a chain to an equal-sized sprocket mounted on a cross-shaft. On the latter a gear wheel is mounted meshing with another gear wheel of equal size, which in turn drives a wheel fixed to one flange of a gin. pulley, enabling an infinitely variable gear, the final transmission, as will be gathered, being by

means of a belt. The operation of this gear is distinctly ingenious. A shaft passes through the centre of the pulleys, and on its periphery is formed a slow pitch worm of special design. At the right-hand end of the central shaft a gear wheel is mounted meshing with a quadrant suspended from the crossbar. The action is as follows: Rotating the central shaft by means of a side lever performs a double purpose. The worm causes the right-hand flange to move laterally, so expanding and contracting the pulley groove and varying the gear ratio. The gear wheel, by rolling around the fixed quadrant, causes the whole pulley to swing radially around the transverse shaft, thus taking up the belt slackness on the low gears.

Two points in connection with the gear are worthy of special mention. The connecting link between the transverse and vertical operating rods has a tunnel formed for a spiral spring; another spring is

Chassis of the Brough, showing exposed position of the 6 h.p. air-cooled engine.

The variable pulley gear.

- C. Fixed pulley flange driven by and moving radially around the train of gears.
- D. Movable flange operated by a worm on a central shaft.

New Brough Sociable.—

placed outside and a milled nut provided to adjust its tension. The object of the springs is to absorb all shock or jar to the rider's hand in changing the gears. The second point applies to the positive nature of the gear changing. One lever does all the work; nothing could be simpler, and a free engine is instantly obtainable.

Other Features.

Steering is by rack and pinion, and is of sturdy design. The tubular axle is $1\frac{3}{8}$ in. diameter, and the steering heads have adjustable ball bearings.

The accessibility of the back wheel is an important point in the design of a successful three-wheeler, and Messrs. Brough have not lost sight of this fact. Five minutes would be an outside estimate for removing the Brough driving wheel, for one merely need unscrew the axle nuts and brake connection and the axle slides out of open jaws formed in the underpart of the supporting bracket.

The driving chain is adjusted by sliding the engine bodily forward, the holding-down bolts passing through slots for the purpose.

The engine starter is by means of a kick-down pedal inside the body geared up to the engine 2 to 1. The mudguards are of large dimensions, and splayed in front. The retarding effect consists of a Raybestos-lined band brake and a belt rim foot-applied brake.

The dimensions are as follow: Wheelbase, 6ft.; length overall, 8ft. 6in.; track, 3ft. 9in.

Altogether, we expect great things of the new Brough runabout. The neatly designed flush-sided body gives it an attractive appearance. The quality of Brough productions has long since been proved, and we are looking forward to an extended trial of the sociable at no distant date.

Showing springing of driving wheel, channel steel frame, torque rods, and large sized band brakes.

Sutton Coldfield A.C. Two-Day Trial.

SUTTON COLDFIELD A.C. MOTOR CYCLE CHAMPION. H. C. Newman ($3\frac{1}{2}$ h.p. Ivy Precision), winner of the Sutton challenge cup and gold medal, and also Murratti Ariston trophy and gold medal for best performance in all Sutton Coldfield A.C. competitions throughout the year.

The result of the week-end reliability trials on the 16th and 17th inst. is as follows: 1, H. C. Newman ($3\frac{1}{2}$ h.p. Ivy-Precision), Sutton challenge cup and gold medal, also Murratti Ariston trophy and gold medal for best performance in all club competitions throughout the year; 2, W. B. Gibb

($2\frac{3}{4}$ h.p. Douglas), gold medal (presented by the Triumph Co.); 3, F. A. McNab ($3\frac{1}{2}$ h.p. Trump-Jap), non-stop, bronze medal; 4, J. J. Woodgate (4 h.p. Singer), non-stop, bronze medal; 5, H. C. Pickering ($2\frac{1}{2}$ h.p. A.J.S.), non-stop, bronze medal; 6, W. H. Sheldon ($3\frac{1}{2}$ h.p. Regal-Precision), non-stop, bronze medal. W. H. Sheldon also wins silver medal for best performance of a novice.

Newman's performance in the final trial was exceedingly good, for, despite the difficulties of the course, his total error for the two days was only $2\frac{1}{4}$ minutes.

WAYSIDE ADVERTISEMENTS.

Motorists and others using the roads of this country have their sense of beauty offended every day by the sight of hoardings advertising motor car necessities which obtrude themselves on the road. In many districts the charm of the landscape is quite spoilt by these advertisement boards, which, unfortunately, appear to be increasing in number. It is known that in many cases these boards are erected almost unwillingly by firms compelled to meet the competition of their rivals, and these firms would be quite ready to withdraw them if their competitors would agree or were compelled to do the same. In three counties—namely, Hampshire, Gloucestershires, and Surrey—byelaws have been framed to prevent the exhibition of advertisements "so placed as to disfigure the natural beauty of the landscape," and the General Committee of the R.A.C. and Associated Clubs has now resolved to take steps to secure a more general adoption of such preventive measures.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Second-hand Machines and Agency Conditions.

[6178].—I am in support of letter 6134, and think it is a subject which needs ventilation. I have been riding a particular make for three years, having had three machines. I have purchased outside my district because I have business relations with an agent. Am I, therefore, under the new conditions mentioned by your correspondent, to be dictated by the makers of the machine as to where I shall buy?

Again, what is to prevent anyone buying a machine from one of the several largely advertised houses? These firms invite you to get a quotation from them and offer a good allowance for your old machine. It appears to me to be carrying things too far, and I doubt very much if it is a good policy, as in my opinion the buying public will not be dictated to. The agent is being held in, too, because one agent may have a large district and not many customers, while another may have a small district with a large population and many customers. From my own point of view, I intend to buy where I like, and don't intend to be dictated to by any motor cycle manufacturer, the only result being that I should change the make of machine. WASKA.

Lining on Tanks.

[6179].—I noticed in *The Motor Cycle* of November 30th that "R.J.D." wishes to know if lining could be done by an amateur.

I found myself in the same quandary. I wanted to paint my tank aluminium, with black panels and double thin lines. The three coats of aluminium paint were easily applied, but, try as I would, I could not draw straight lines nor draw the panels with neat straight edges.

By good luck I casually mentioned the matter to a chemist where I was making a purchase, and he made up some sort of black paint, which is both water and petrol-proof when dry, and does not blur when being put on. It is used with a special pen, also a ruler or straight-edge, and you line your tank as if you were ruling lines on a piece of paper with an ordinary pen, ruler, and ink, also you can make the lines as thin as a pin or as thick as a pencil.

As I have had many valuable "tips" from your paper, I am only too pleased to help a brother motor cyclist. The name and address of the chemist who supplied me is Roland Bros., 7, Castle Street, Edinburgh. W.D.

Tolls and Taxes.

[6180].—I think it an opportune time to call the attention of the motor cycle world to what I consider a serious item to the financial side of the pastime. I refer to the tolls on the principal highways, and one in particular, Bursledon Bridge, situated on the main road between Portsmouth and Southampton. All the South Coast traffic from Brighton to Weymouth passes, or should pass, through this gate, so it really affects hundreds. One expects to pay when crossing a river by motive power, such as a floating bridge, but when a toll is demanded for crossing a structural bridge not fifty feet long and situated on the King's highway, I shall have many supporters when I say that such tolls should be abolished. With a heavy tax on our shoulders, surely we can claim some assistance to obtain such an end. Granted that the bridge was erected by a private company, I maintain that it has paid for itself a hundred times over (I have paid over £5 during this year), and should now be thrown open to the public or else acquired

by the County Council. Of course we cannot expect the company, who are reaping large dividends, to part willingly with such a gold mine, which is indifferent to the rise or fall of stocks and shares, but, with a little pressure to bear from the right quarter, we might at least obtain some concession if only in the reduction of the toll, which is at present extortionate, viz., 3d. single, 4½d. return, available for day of issue only. It is possible to avoid Bursledon Bridge by going *via* Botley, but even then one is faced with a toll of 2d. near Botley, besides the extra five miles the latter journey entails. Apart from the financial question of highway tolls, what is more aggravating than stopping and fumbling for a few coppers, especially when it is raining and one is nicely snugged down. The question of this toll might well be looked into by the A.A. and M.U. with advantage, not only to the motor cycle community, but to pedal cyclists and motorists as a body. C.R. 1030.

Adjustable Petrol Jets and Chain Drive.

[6181].—Letter 6123 describes a home-made adjuster or jet. A good many of us could make this if it be satisfactory. I cannot see that one would get a constant petrol level; if it were possible there would be no economy in running on a small hole in adjuster. It seems to me that the regulating device must be at the top of the jet.

At the Show I bought a small spiral spring with a conical top to slip on jet. When fitting I tilted the carburetter a little to get a good head of spirit. Whether the much increased power I got is given by the tilt of the carburetter, or the coil in atomising the spirit I have not had time to ascertain. At rest there is no dripping of petrol, but the consumption is greater.

Now that chain drive is being discussed, I would like to point out that a very great many 3½ h.p. owners use their machines with sidecar, and without same, say, alternately. With belt drive, it is a five minutes' job to make one's gear suitable for both purposes, but what about chain? My ideal for a 3½ h.p. for passenger work and solo riding is an enclosed chain to a large adjustable pulley on the bracket, thence by belt to the wheel, with a three-speed hub if that hub be capable of hard wear. R. H. ADAMS.

An Unusual Experience.

[6182].—I have been a motor cyclist for several years now, and as a pastime it is undoubtedly unsurpassed, but when I read in your periodical about the reliability of the modern machine I cannot help feeling rather sceptical.

For instance, about two months ago I bought one of the best sidecar machines on the market, with change-speed gear box, costing altogether about £100. Now for this sum one would expect to obtain a reliable machine, but what happened?

Riding the combination home, the back voiturette tyre burst. I had to insert a new inner tube, and the next time I took it out the gear lever dropped off in the road.

I took these troubles philosophically, but when on my next trip the steering head came loose, and I took a flying leap over the front and landed on my shoulder with £100 worth of motor cycle and sidecar on top of me, I thought I had just cause of complaint.

The agent I purchased the machine from approached the makers who disclaimed all responsibility, and duly charged for the repairs.

I think you will admit that this is enough excitement in the first fifty miles. SYD. J. TINNER.

Continental Touring.

[6183.]—It is not necessary for motor cyclists to go to the worry and expense of taking out international passes when touring abroad, at any rate in France and Switzerland.

Last year the A.A. and M.U. informed me it was necessary, but I was in a hurry and decided to risk it. I have noticed that most of your contributors who have toured abroad took out a pass. Personally, the best thing to do, I think, is to join the Touring Club de France for the modest sum of 5s. (6fr.) a year, which, not only ensures all lack of trouble at the customs, but politeness and civility wherever one may go in France. It is a very simple matter to get a small photograph of oneself to fix to the membership card. It took me not more than a minute to pass the customs at both Dieppe and Valloske, in the first case a *permis* having to be obtained, and in the second the number of the machine verified.

This contrasted favourably with my reception by the customs at Newhaven on my return. I was detained for over half an hour by a fussy under-official, who, in spite of my travel-stained appearance, my A.A. and M.U. card, and the name Triumph on my equally travel-stained machine, insisted that I might be going to sell it and wished to weigh it, and goodness knows what besides.

It was not till I found the chief customs officer that I could get out of his clutches. A French visitor would, probably, have been unable to get away at all that night.

W. D. G. BALLEN.

Do Records appeal to Buyers?

[6184.]—I often wonder what is the use or benefit to motor cyclists as a body in everlasting breaking of records. To amateurs who do not fully understand, these records must be terribly misleading. You hear a dealer say to a prospective customer, "The — got the hour record again, so you see you cannot do better than buy a — its the fastest machine on the market." The deluded one buys one and finds he can only do, say, fifty to fifty-five at the most, and this only for a short distance. He does not understand how it is, and fails to understand that the record machine is specially altered and tuned for the track, and if it were possible to buy such a machine he would find neither comfort nor reliability in riding it after a few miles.

To my mind, there seems more commonsense in doing long distances on the road on standard machines.

But to expect sixty-five miles per hour from one of these is out of the question, unless you happen to be friendly with the firm or a "shamateur." Manufacturers should encourage more clubs by giving prizes for competition, and let the amateur members prove what a machine can do, for they are the men from whom makers get their profit and for whom they cater. I contend that for an ordinary rider to win a hill-climb on his own machine should be more guide to a buyer than all this record breaking.

I may take a wrong view, but I fancy if the man in the street had the case put before him he would agree with me.

I might conclude by adding that so far as I am concerned it does not interest me in anyway which machine has broken this or that record, and further it would not influence me in anyway in purchasing a new mount. C.B.R.

Motor Cycle Design.

[6185.]—Several notes have recently appeared in your columns, by "Ixion" and others, running over desirable features in machine design. There is now on the market a British machine which contains practically all these points, and it may be worth while to summarise them.

Illustrations were given of a new American machine with a cantilever spring seat pillar. My British one standardises it. The top rail is dropped and the position is very comfortable and low. The footboards are five inches wide and twenty inches long, curved up comfortably at the front.

"Ixion" had a tilt at gear and brake pedal positions. The pedals on my machine are just behind the engine, below the magneto, very handy in use and, I should think, absolutely safe in case of a fall. The machine rests comfortably on the footboards when leaned over. The toolbag is carried at the back of the carrier on a second shelf, and is bolted to uprights at the back. The number is painted on the flap.

The belt rim edge is well rounded, and the rim is wide enough for a 1in. belt (the machine is a 3½ h.p.). The transmission is by belt to a two-speed hub gear with variable

engine pulley. There is a small screw in the gear which, merely screwed home, gives a fixed gear to ride home on in the unlikely event of gear trouble. The starting is by handle. Lubrication by sight drip feed, also two-way pump.

The back mudguard extends over the belt; the front has side wings from end to end. The tyres are 26 × 2½in., and the sidecar fittings are incorporated in the frame. The lamp bracket is very strong, and the generator bracket is fitted on the frame. The priming valve is a needle valve controlled from the top of the tank, dropping petrol straight into the compression cock. The front forks are Druid, and the filler caps are 1½in. diameter, with fine gauze strainer in petrol opening. The machine is a Rex. J. STUART WHITE.

The Passenger Question.

[6186.]—There are few motor cyclists who do not cherish two ideals—one, to be able to take a friend on their machine, the other, to dispense with overalls.

Up to the present the sidecar, chiefly on account of its speed and low cost, has met the demand best, but the rider still has to don his overalls. There can be no doubt that there is a great potential demand for a three or four-wheeler which will not fear comparison with the average motor cycle on a steep hill, and which will approximate to the sidecar in first cost and upkeep. Up to the present the development of these self-contained vehicles has been along normal commercial lines, as opposed to what one might term the forcing house of racing, to which we owe the perfection of the modern motor cycle.

Has not the time come to call upon the A.C.U. to provide a T.T. race for these vehicles, so that their development may be fostered to the same extent?

What delightful little vehicles would then appear. The greatest care would have to be taken to define the limits beyond which this type must not go. Weight and price should do this. After these two factors comes, in order of importance, appearance, steering, and stability; three or four wheels, and the transmission. For the last three points we must look to racing for a decisive answer. But it may be said that (a) three wheels makes the positive drive easy but good steering difficult; (b) four wheels makes good steering easy but (at motor cycle price and weight) involves belt drive.

In regard to belt drive, it seems as if the geared-up pulley is going to give it a new lease of life. If the belt drum were on the inside of the wheel and on separate spokes it would scarcely be seen. Silence, which is of vital importance, should be cultivated. H.M.

The first lady member of the Leeds Motor Cycle Club—Mrs. E. Smith, who, although a motor cyclist of but three months' experience, is a skilful manipulator of her 2½ h.p. three-speed Hobart.

Winter Mudguarding.

[6187].—I shall be most happy to accept Mr. Eric Longden's challenge, and am willing to meet him on the roughest day he can choose, and shall welcome a hilly course. The machine I propose using will be my 7 h.p. Indian and sidecar. To remove the back wheel I have simply to undo one axle nut, withdraw two brake pins, and spring the connecting link of the chain, therefore I do not anticipate that I shall be far behind in this part of the contest, and believe that I can complete the job without unduly soiling my fingers.

ERNEST FRASETTI.

Hill-climbing.

[6188].—As Mr. Frank Smith is confident of his ability to climb any hill on the Clyno, may I suggest the following route:

Keswick, Portinscale, Stair, Newlands, Buttermere, Honister Pass, Seatoller, Borrowdale, and Keswick.

Although this route is only about twenty-four miles, it contains two hills that are real teasers, the first up to Buttermere Hause and the other up Honister.

This latter has never been climbed by a motor cycle, although many have tried, and, personally, I think it is beyond the Clyno's power.

A. NEWMAN.

Touring in North Devon.

[6189].—Without wishing to take up the cudgels on behalf of "Kuklos"—who is well able to take care of himself—I must disagree with your correspondent, Mr. L. W. Spencer, when he says that Malmsmead Bridge is at the entrance to the Doone Valley, and readers of "Lorna Doone" should also be well aware that this is incorrect. The Doone Valley lies three miles to the south of the famous Malmsmead Bridge, and, except for the first hundred yards or so, there is only a footpath leading to it—quite impassable for motor cyclists. The valley is plainly marked on Bartholomew's North Devon, sheet No. 35.

FRANK A. REEVES.

[Malmsmead Bridge is at the foot of the valley where the Bagworthy water joins the Lynn stream. The town of the Doones was, of course, some distance up this valley, but it is the same valley, and that is what Mr. L. W. Spencer means. Neither he nor anyone else said that there was a road up John Ridd's famous water slide and through the Doone Gate.—Ed.]

Where to Pay Local Taxation Licences.

[6190].—The time will shortly arrive when motor cyclists will have to pay their annual motor cycle tax. With the Editor's permission, I should like to ask all my fellow motorists to pay the money into those counties or county boroughs which have kept their roads free from the police trap. It is some consolation to know that, although the payment of the tax is compulsory, we can at least "get our own back" once a year, and now is the time to do it.

SHAZBAZZIK.

[6191].—Will you kindly grant me the privilege of appealing to all motor cyclists to take out their Inland Revenue licences for the new year in one of the following "clean counties": Bedford, Cornwall, Derbyshire, Durham, Hereford, Leicester, Monmouth, North Hants, Rutland, Suffolk, Wilts., or Westmorland.

By clean, I mean free from the unmanly and un-English police traps prevalent in the remaining counties.

The figures are not yet available for 1911, but in 1910 all the foregoing were entirely free from traps.

May I ask all London men particularly to avoid payment in the county of London, which contained twenty-three traps in that year, Middlesex twenty-seven, and the notoriously vindictive Surrey the record number of sixty. I am glad to say that I induced forty-two motor cyclists last year to take out their licences in Bedfordshire; many of them also registered their machines in that county, whilst several induced their friends to take out dog and gun licences in a similar manner.

It is a matter for much regret that up to the present no concerted steps have been taken by motorists to organise themselves into a strong compact body, and by these means make their influence directly felt.

W. H. BROWNE.

Are Provincial Shows Wanted?

[6192].—I have read in trade papers and elsewhere of the keen feeling amongst motor cyclists and the retail trade at the studied efforts of the Manufacturers' and Traders' Union to boycott any exhibition outside Olympia. One can understand the feelings of these two great sections of the people interested in motor cycling, and without which the M. and T.U. might shut up shop to-morrow. You will be interested to hear that the arrangements for the annual show for Leicester and Midlands gives promise of being a bigger success than ever, and will be held in Leicester February 7th-10th of next year. Nearly all available space is booked, so I do not write with any particular personal feelings in the matter.

HERBERT E. SMITH.

Secretary, Leicester Motor Cycle and Cycle Exhibition.

Analysis of Carbon Deposits.

[6193].—As the substance sent to me by "Archibald" as cylinder deposit was actually taken from his tobacco pipe, the presence of road matter proves that Archie is a "snapper up" of unconsidered trifles dropped by gentlemen.

When "A.'s" fund of knowledge has been increased so as to become a positive quantity, he might look at the analysis of tobacco ash in the third volume of T. E. Thorpe's "Dictionary of Applied Chemistry," page 850. He may then see what an exhibition of himself he has made in his troglodytic effort to be humorous.

The elements found are all present in ash from tobacco, even "ferric oxide and road matter."

W. ELDER.

[6194].—I note in *The Motor Cycle* a letter signed "Archibald," about an analysis of carbon deposit.

I have looked up Mr. Elder's analysis, and find in it nothing whatever to indicate that it is not "strictly accurate," as "Archibald" states.

Tobacco ash always contains a considerable amount of ferric oxide, calcium oxide, and magnesium oxide, and usually some silica, besides, of course, carbonaceous matter when obtained from such a source as a pipe bowl, where the leaf is incompletely burnt.

The presence of such matter was naturally attributed by the analyst to road matter, since engine oil is free from such mineral substances.

I can assure "Archibald" that 16.90% of residual ash in his pipe deposit does not indicate adulteration, rather the contrary in fact.

HENRY W. MOSS.

Mudguarding—Transmission—Silence.

[6195].—As one who has ridden motor cycles constantly since 1908 in a general medical practice, I think I can lay just claim to knowing a thing or two about these machines. In the above time I have owned ten motor bicycles of different makes, and have by now naturally very strong opinions on certain subjects, viz., mudguarding, transmission, and silencing. I quite agree with the letters written by "Clericus" and F. T. Marley. Shaft drive is bound to come into general use, and the sooner it comes the better. So-called experts condemn it, so did they condemn the pneumatic tyre in its early days, but it came and stayed, and so will the shaft drive. Eric Longden's letter is amusing; if the belt is so superior, why was it done away with on cars, where it could have been fully protected? When, sir, will you be able to knock out of the head of a certain class of rider the idea that a silent motor cycle is dangerous to the public? Is a silent motor car dangerous? Of course not. I have never had a noisy motor cycle yet, as I have had them all properly silenced. To compare the unnecessary noise made by a motor cycle to the—I grant objectionable—noise made by a trolley, which is not preventable, is ridiculous.

"Critics the Second" is condemned out of his own mouth. Why should his engine seize and so throw him over the handle-bars? To argue like this, one might demand an extra strong front wheel in case one ran into a wall. I rode a chain-driven machine many years ago, for two years, with the greatest satisfaction, and have never had a broken chain, been over the handle-bars, or had a seized engine.

To conclude, I always ride, and have always ridden, a silent machine, and have not hurt anyone, and the sooner everyone is made to ride silent machines the better for the sport, or whatever it is called.

H.T.M., M.D.

CLUB NEWS

Wimbledon M.C.C.

A meeting will be held during the first week in January, 1912, to found a club for Wimbledon, and elect the officers. All who wish to join should write to Mr. E. P. Lyon, 31, Queen's Road, Wimbledon.

Selby and District M.C.C.

At a preliminary meeting, held at the George Hotel, on the 14th, it was decided to form a club under the above title. Motor cyclists who are interested should communicate with the hon. sec., Mr. Joshua J. Day, Green Lane, Selby.

Ipswich and District M.C.C.

The above newly formed club held a very successful run to Diss on Saturday afternoon, the 16th inst., tea being served at headquarters on the return journey. An interesting discussion was also held the same evening on the various machines exhibited at the recent Olympia Show. A run was also held on Boxing Day.

Sydney M.C.C. (N.S.W.)

The above club's non-stop reliability trial to Lithgow, held recently, proved very successful. There were sixteen starters, and all arrived at Lithgow with the exception of F. Flew (6 h.p. Roc), who met with an accident at Wentworth Falls, damaging his machine, and was, in consequence, unable to continue the journey. R. W. Allen (3½ h.p. Zenith) and P. Bayley (3½ h.p. N.S.U.) tied for the best performance, both completing the journey without loss of points. These riders have agreed to divide the first and second prizes. D. St. Clair (5 h.p. Rex) and J. W. Empson (3½ h.p. L.M.C.) also made non-stop runs, but both lost points through arriving early at control. During the trip a hill-climbing contest was held on Gould's Hill, Bowenfels. The course was about half a mile in length, the last 100 yards having a gradient of 1 in 6. This event was won by R. W. Allen (3½ h.p. Zenith), who negotiated the course in 63s.; R. Glanfield (3½ h.p. Bradbury) being second, and taking 66s. to ascend the hill.

The Grosvenor M.C.

The annual meeting will be held at headquarters on January 4th, 1912, when officers will be elected for the year.

Coventry and Warwickshire M.C.

The members' yuletide run to the Dun Cow Hotel, Dunchurch, will start from the corner of Whitley Common, at 3.30 p.m., on Saturday next.

South Birmingham M.C.C.

The first general meeting will be held on January 11th, 1912, at 8.45 p.m., and the first annual dinner on January 17th, both at headquarters, the Mermaid Hotel, Stratford Road, Sparkbrook.

Sutton Coldfield A.C.

A library and reading room are to be formed at headquarters. The club would be glad to receive catalogues from manufacturers and accessory dealers to be filed for the use of members. These should be sent to the hon. secretary, Mr. H. Smith, Royal Hotel, Sutton Coldfield.

Derby and District M.C.C.

The annual dinner took place at the St. James's Hotel on the 13th inst. There were many excellent speeches. Mr. Sewell, in replying to the toast of "The Visitors," congratulated the club upon its achievements, and said that it was a great thing to win *The Motor Cycle Cup*. The Secretary mentioned that the Rev. A. Gamble, in addition to presenting the club with the Henmore Cup, had given a speedometer for use in competitions. The date of the winter run has been altered to January 20th.

Westmorland M.C.C.

The annual meeting was held on the 8th inst. at the Commercial Hotel, Kendal. Mr. T. H. Armstrong was elected to the post of treasurer, Mr. C. B. Robinson hon. secretary, and Mr. H. Goodwin, of Orton Hall, president. Brigsteer Brow was provisionally chosen for the annual open hill climb.

GONMETZ-LE-CHATEL HILL-CLIMB. Granvand driving a La Ponette, winner of his class in the French winter hill-climb. This interesting design of quadcar was described and illustrated in our issue of November 30th, page 1331.

Tourist Trophy Races, 1912.

Mr. H. P. E. Harding, one of the judges in this year's Tourist Trophy Races, has very kindly requested the A.C.U. Committee to place the out-of-pocket expenses to which he was entitled as a judge to the credit of the fund which is established to defray the expenses of the T.T. Races for 1912.

Brooklands and the Six Days'.

In connection with next year's annual 1,000 miles reliability trials, *The Motor Cycle* suggests that the last day's run be held on Brooklands Track, in the form of a high-speed reliability trial. If our suggestion were adopted, it would mean four days touring on the difficult West-country roads, one day riding to Brooklands, and one day on the track. See our leading article this week.

Auckland (N.Z.) M.C.C. Hill-climb.

This event, the first of its kind held by the club, attracted a large number of entries and spectators. The stiff gradient of the hill and the bad turns put both machines and riders to a very severe test. B. E. Jenkins, on a $3\frac{1}{2}$ h.p. L.M.C., made a fine performance. He rode a standard touring machine. Results:

1. B. E. Jenkins ($3\frac{1}{2}$ h.p. L.M.C.), $36\frac{1}{2}$ s.; figure of merit, 52.83; gold medal.
2. C. E. Atkin ($3\frac{1}{2}$ h.p. Triumph), 45s.; figure of merit, 62.42; trophy.
3. F. J. Harris ($3\frac{1}{2}$ h.p. L.M.C.), $47\frac{1}{2}$ s.; figure of merit, 64.11; trophy.
4. S. Brooks (5-6 h.p. Matchless), 35s.; figure of merit, 64.23; fastest time.

English-Dutch Trial.

Brief regulations governing the English-Dutch M.C.C. trial appeared in our last issue (page 1288), and next morning we began to receive entries from British motor cyclists, so that presumably this international trial in Holland will prove a popular event. It may be recalled by some readers that Messrs. W. Cooper and W. Pratt first suggested this trial through the columns of *The Motor Cycle*, and on seeing the regulations in print, have written offering to captain the amateur and trade teams respectively, and two more experienced competition riders could not be selected. Names received up to the present are as under:

PRIVATE OWNERS.

- W. Cooper (Harrow).
- F. C. Wasley (Bristol).
- G. Smith (Coventry).
- L. A. Baddeley (London).

TRADE RIDERS.

- W. Pratt (London).
- J. Woodhouse (Birmingham).
- F. W. Barnes (Weybridge).

Gometz-le-Chatel Hill-climb.

In the above event (described on pages 1401-3 last week), A. J. Moorhouse (Indian) should have been placed first in the amateur class with W. H. Bashall (Matchless) second, the times being 28 $\frac{3}{4}$ s. and 33s. respectively. In the inscription to the photograph published last week we pointed out that Moorhouse made second fastest time of the day; this he accomplished in the unlimited class, the time being 28 $\frac{3}{4}$ s., Bashall's time in this class being 28s.—the best.

A.C.C. de France 1912 Programme.

The organisers of the Gometz-le-Chatel hill-climb, encouraged by the success of the event described last week, have issued an ambitious programme for next year. The events which this club will organise comprise the Tour de France reliability trial, on a circular route which embraces practically all the principal towns of France, and is over 1,500 miles in length. This event is for touring motor cycles only. Track races for one hour and 100 kilometres (62.1 miles), when attempts will be

BROOKLANDS AND THE SIX DAYS' TRIALS.**A SIDECAR IN CORNWALL.****DESIGN OF RIMS AND TYRE BEADS.**

made to beat records. Attempts on road records for the kilometre and the mile, with standing and flying start. A road race on a properly guarded circuit over a distance of 155 to 166 miles.

The Feeling Towards Motor Cycles in Holland.

Mr. Citroen tells us that on the occasion of the international contest on August Bank Holiday the Dutch M.C.C. expects to collect together at least sixty motor cyclists, and this, he considers, will be a great thing for the future of the motor cycle pastime in Holland. In public eyes, he adds, motor cyclists are still a danger on the open road in Holland, and the club's endeavour is to do what it can to allay that idea. At present, the Dutch M.C.C. is doing its utmost to prevent the use of the silencer cut-out in towns and villages, and the club looks to the British competitors to help it in using the cut-out only on the open road, and only then if absolutely necessary.

MARRIED COUPLES WHO MOTOR CYCLE.

Mr. and Mrs. F. G. Newbury, of Southgate, London, N., whose mounts respectively are a $3\frac{1}{2}$ h.p. Bradbury and a $2\frac{1}{2}$ h.p. Douglas.

Running Costs.

A correspondent whose letter appears this week under "Cost of Running a Motor Cycle," proves he has ridden 11,490 miles at a cost of a little over a halfpenny per mile.

Touring in Switzerland.

Motor cyclists who tour in Switzerland will be interested to know that dating from June 1st next year they will be able to use the road connecting Martigny and Chamounix under special regulations which will be issued by the authorities of the Canton du Valais. The Swiss are coming round.

Stolen Machines.

Between 11 p.m. on the 16th and the afternoon of the 17th, thieves entered the premises of Robertson's Motor Agency, 157b, Great Portland Street, W., and removed a 5.6 h.p. 1911 Bat with P. and M. two-speed gear and Rom tyres. The two-speed gear cover has a home-made oil flap, and there is a home-made handle to the oil pump. The number of the engine is 6520. The victims of the theft inform us that this is not the only case which has occurred in the neighbourhood lately. If this machine is offered to any of our readers will they kindly communicate with Messrs. Robertson's at the above address.

The Institution of Automobile Engineers.

The third meeting of the session of the Institution of Automobile Engineers was held on the 13th inst., when a very able paper was read by Mr. L. H. Pomeroy, Wh. Ex., on "Engine Design for Taking Advantage of Horse-power Rating Rules," the author basing his claims on actual experience with engines constructed and run by the Vauxhall Motor Co. Interesting particulars were given of an engine with a bore of 3.12 in., but with a stroke of no less than 8 in. Copies of the above paper may be obtained in pamphlet form price one shilling each. During the evening it was announced that twenty-five elections had been taken up since the last announcement, and also that over forty applications had been dealt with by the council that evening.

Dunkerry Beacon, or Light on Exmoor.

We all know that the Doone Valley as described by Blackmore does not exist. Any tourist who set out to find the Doone Gate, John Ridd's Waterslide, or Lorna's Bower, would return disappointed. "Kuklos" goes very thoroughly into the matter in the *Daily News* of the 20th inst.; and considerably amends his previous statements. He now says he knew all about the road referred to by our contributor and shown on the map. So he may have done, but it looks very much as if it had escaped his memory. "Kuklos" appears to have been misled by the words "via the Doone Valley," which he seems to have taken absolutely literally, which we did not. The road in question passes the bottom of the valley through which the Bagworthy water flows, and this was the valley in which lived Sir Ensor and the rest (according to Blackmore). We agree with "Kuklos" that the road through Dunster, Timberscombe, and Wheddon Cross is the better, but the coast road gives an unequalled opportunity of seeing fine coast scenery.

The Popular Motor Cycle.

Mr. F. Warwick, presiding at the annual meeting of Components, Ltd., at Birmingham last week, said there was quite a small boom in motor cycles, and it was likely to assume very considerable dimensions. It was a very interesting question as to whether there was to be a revival in the fortunes of the cycle trade due to the motor bicycle. The present was an age of rapidity of transit, and a large majority of those who could afford it would purchase a motor cycle in preference to a "push" cycle. The motor bicycle was no longer an athletic and speed instrument, but a handy vehicle for pleasure, travel, and holiday which could be used by both sexes.

FUTURE EVENTS	
Dec. 30.—North West London M.C.C. Twelve Hours' Winter Trial to Gloucester and back.	1912.
Jan. 20.—Herts. County M.C.C. Open Trial.	
" 20.—A.C.U. Annual Dinner.	
Mar. 2.—Auto Cycle Union Open One Day Trial.	
" 23.—B.M.C.R.C. Race Meeting.	
" 30.—Derby and District M.C.C. Open Hill-climb.	
Apr. 5-8.—N.W. London and Herts. County M.C.C. Joint Trial and Open Hill-climb (Yorks.) and Ladies' Competition.	

Enquiries re Second-hand Machines.

A correspondent named S. J. Hewes, of Brockley, Kent, who advertised a 2½ h.p. Minerva in *The Motor Cycle* for £6, received a foolscap sheet of paper containing thirty-six distinct queries as to the condition and capabilities of the machine, all of which showed that the enquirer had a considerable knowledge of motor cycles, and did not intend to buy "a pig in a poke." At the same time it is rather a trial to fill up definite replies to thirty-six queries regarding a second-hand machine value £6. Motor cyclists are so keen irrespective of the price paid for a mount.

Activity of the R.I.A.

The Roads Improvement Association has been very active of late. Meetings have been held of the following centres of the organisation: Bristol, Yorkshire (North Riding), Lancashire and Cheshire, and Sussex. Various recommendations for improving roads, widening roads at bad corners, and alterations to narrow bridges were forwarded to the authorities. Altogether the R.I.A. is to be congratulated on the good work it is doing on behalf of motor cyclists and road users in general.

Benefiting a Clean County.

Motorists are evidently bent on showing their disapproval of the un-English police trap. We have received quite a number of letters urging our readers to take out their local taxation licences in "clean" counties which were free or practically free from police traps during the present year. Some are going further and paying their licence fees for dogs, guns, carriages, male servants, and so forth, in the clean counties. There is no law to prevent one from taking out a licence in any county one chooses, and so considerably benefiting the funds of the clean county, whilst still showing disapproval of the methods of the "black" county.

Despatch Carrying in Australia.

A relay ride of great interest and value will take place next April, under the auspices of the Dunlop Rubber Co., of Australasia, from Adelaide to Sydney, a distance of 1,149 miles. The despatch carriers will be in three divisions, cyclists, motor cyclists, and motor cars, with scheduled speeds of sixteen and a half, twenty-five, and twenty-eight and a half miles per hour respectively. There will be sixty-four relays of cyclists, twenty-five of motor cyclists, and four of cars. The object of the test is to see which division will get their despatch through first, the cyclists having a start of twenty-four hours from the motor cyclists, and thirty hours from the autocars. The Dunlop Co. are receiving applications from those wishing to take part from all parts of Southern Australia.

A NEW T.T. MODEL.

3½ h.p. Campion-Jap for 1912—a make of machine which is well-known in the Notts. and Derbyshire district. A T.T. mount is a new departure for the Campion Co.

THE MOTOR CYCLE IN CEYLON.

HAVING covered some 3,500 miles this year on my 1910 T.T. Roadster Triumph, the following notes and photographs may be of interest to riders at home. So far I have found no hill in Ceylon on a public road which my machine will not go up easily, in any weather, on a gear of $5\frac{1}{2}$ to 1, and I can get up most on a 5 to 1 gear. This is a pretty good testimony to the flexibility of the T.T. engine, when I add that the roads are usually only eight feet wide, and many of the corners absolute hairpins, which it is impossible to round at more than ten to twelve miles an hour. The gradients, though very long, are nowhere really steep, though one or two short stretches of 1 in 8 may be occasionally met with. The average gradients are 1 in 12 or 1 in 15. Belt drive is not altogether satisfactory

The Rainfall of Ceylon.

A belt shield is an advantage, and magneto and sparking plug covers a *sine qua non* in an island where the rainfall sometimes reaches 200 inches in the year, or even more. Nearly all my riding has been up country, at elevations varying from 1,500 to 6,200 feet above sea level; but I have had some interesting experiences in the low country, especially in the Monsoon. I have several times found the roads under water near Colombo, and had to put myself and motor cycle in a catamaran, made of a dug-out tree trunk with an outrigger fitted to one side, to be ferried across the flood. Again, I have ridden my machine along the side of the railway track for three miles, when the road to my destination happened to be eight feet under water.

in the hills, as one gets a great deal of wet weather, which, of course, makes belts slip at the critical moment; but otherwise I find them last fairly well, a $\frac{7}{8}$ in. rubber belt lasting me 1,500 miles, and rubber-studded tyres on back wheel about 1,800. The continuous corner work and braking when meeting carts, etc., of course, greatly shortens the life of belts and tyres. I consider a two-speed gear for solo work quite unnecessary on any machine of $3\frac{1}{2}$ h.p. and over if fitted with an adjustable pulley giving an ample range of gears, but a light clutch is certainly an advantage (though I don't find the need of one myself). I would not have pedals at any price. They always hit the ground at corners, and are of no use that I can see on a modern machine, except those with clutch in the back hub. Even in this case handle-starting would be preferable.

Almost any machine will do for the "potterer" in Ceylon, but for a man who wants to keep up a decent average the more power the better. I can average eighteen miles an hour over long distances up country, on give and take roads, but if I had a 5 or 7 h.p. machine I could certainly raise my average very considerably.

Passenger Machines.

Sidecars have so far not made much headway out here, but I have seen two castor wheel models, both fitted to clutch Triumphs, up country, and hear they are doing very well, the engines being geared, I believe, about 6 to 1. My ideal machine for this country would be as follows: $3\frac{1}{2}$ h.p. single, or 6 h.p. twin, m.o.i.v., low compression engine; semi-automatic carburetter; magneto high up and well protected;

- (1) A low country village near Kegalle, on the Colombo-Kandy road.
- (2) On the Ginagathena Pass, which rises to a height of 2,400 feet.
- (3) Part of the Kelain Valley, about 100 feet above sea level.
- (4) The top hairpin corner on the Kaduannawa Pass. The gradient at this point is about 1 in 12.
- (5) Colour-sergeant Johnson, of the Ceylon Planting Rifle Corps. He has ridden his Roc all over the island on duty as instructor to the Volunteers.

The Motor Cycle in Ceylon.—

variable pulley; rin. belt; both brakes on back wheel; non-skid tyres both wheels; very low and short frame; two sets footrests; tank to hold two gallons of petrol (depots are usually fifty miles apart); and large pan seat instead of saddle. There are a number of machines on the market which almost fill the bill, and nearly all the leading makers are represented out here. We hope to have some competitions next year, and possibly a hill-climb at Christmas. By the way, I see everyone is agitating for silent silencers at home. These would be very nice out here. (I have tried a 5 h.p. Indian which really was silent!) But a cut-out or exhaust whistle is absolutely necessary, as the native never hears a motor till it is right on him, and a horn has no effect, so the noisier the exhaust the better, except, of course, when on a straight road or when passing horses or private bungalows.

Dogs and cattle seem to have a great dislike to

motor cycles. The former are not usually dangerous, but a nuisance, as they pursue one for a considerable distance; but cattle are much more dangerous, as they often charge at one quite unexpectedly, and one has to be very nippy to get away. A small revolver is the best thing for pariah dogs; it is the only thing that has any effect on them, but one soon becomes quite an adept at potting dogs from the saddle.

In conclusion, to anyone coming out to Ceylon I would say, certainly bring a motor cycle. The scenery is lovely, and the roads fairly good. Prices of petrol vary from Rs. 1/50 per gallon in Colombo to Rs. 2/50 in out of the way parts, and oil is about Rs. 4/50 per gallon. Ordinary spares, belts, plugs, and tyres can be obtained in the large towns, but it is as well to bring out spare valves, etc., for one's own particular machine to avoid waiting two months for new ones. *The Motor Cycle* is widely read out here—long may it continue. "U 32."

NOTES ON TYRE MANUFACTURE.

THERE are a few points which buyers of motor cycles would do well to note when selecting the tyres to be fitted to their machines.—In the first place, it is unwise to be under-tyred—that is to say, the tyres should be of ample size for the work they have to do; the cost may be greater in the beginning, but this policy will be found to be cheapest in the end. Users of sidecars will do well to fit the 650 x 65 mm. car tyres to their back wheels. An efficient non-skid should also be selected. Steel studs are good on country roads, but not on the sets and tramlines found in towns, even when dry. Combination treads are useful, but personally I prefer an all-rubber non-skid of sound construction with plenty of rubber in the tread. These suggestions are, of course, fairly obvious, but there are other points which do not so readily occur to the mind.

Most makers are now moulding their tyres under pressure to the shape they will assume when inflated on the rim; this is a great advance. If a tyre is made like a flat band and then bent round, the rubber is in tension, and when cut will at once open and admit damp and dirt to the great detriment of the canvas lining. Of course, cuts in any tyre should be mended with tyre stopping as soon as discovered, but if a tyre is made in the right shape and the right way, these cuts will not open but keep tightly closed.

The Strength of the Beads.

This is a point the importance of which seems to have escaped the notice of many makers, but fortunately not all. Of course, all makers think their beads are sufficiently strong, but some few do not impress this upon buyers, and in their illustrations sometimes show sections of tyres in which the bead is apparently most inadequately attached. I examined many sections of tyres at Olympia, and saw several examples in which only one thickness of canvas surrounded the bead, the other two sections being inside, where there is little or no strain. One section actually had two thicknesses outside the bead on one side of the tyre and only one on the other, showing that one maker at least did not attach much importance to this point. In the cheaper lightweight tyres one

naturally only found one thickness outside and one inside, but when there are three layers of canvas in a tyre two most certainly should surround the bead, and makers should draw the attention of purchasers to this point. An additional strip of thin canvas is sometimes added—this is a good plan.

A Few Hints to Buyers.

In conclusion, I would advise all buyers to obtain sections of the tyres they fancy; note the shape they retain without being held; then make some cuts with a knife in different directions (a wet blade will make this easier), and see if the cuts open when the section is curved as it would be on the rim (in making this test, be careful not to bend the tyre more where the cut has been made than elsewhere, or the cut will open in any case). And, finally, take particular notice of the canvas outside the beads; there should be at least two layers at this point, and these two

FIG. 1

FIG. 2.

Fig. 1.—Bead as it should be made, showing two layers of canvas at the point A where the strain is. B. Hard rubber of bead.

Fig. 2.—Bead as sometimes made. Note the weakness at A.

layers should surround the tyre; in some cases they cease just above the bead. If small pieces of rubber can be pulled off with the finger nails, the tyre should be rejected at once, for the quality of the rubber is not what it should be. The rubber should feel smooth and silky to the touch, never gritty or rough. There were some few sections at Olympia so excellent in form, design, and quality of rubber that it would be hard to select the best, but, on the other hand, several could at once be discarded as quite unsuitable for motor cycle requirements.

AURIGA.

THE heading of this article is rather ambitious, as under certain circumstances it is impossible to prevent side-slip. The subject of side-slip has had much written about it, and it is not proposed to enter into the merits and demerits of various non-skid devices, but to give a few hints as to how the risk of serious skids can be best avoided.

The first rule to observe is to gear low, and not to try and ride too slowly. A high gear and a slow powerful kick of the engine are apt to cause the rear wheel to spin, and this "relative motion" is the cause of more side-slips than anything else. For the same reason, it is not advisable to accelerate quickly in grease. Never apply the brakes suddenly, for to lock the wheel is as deadly as to let it spin. Keep as far as possible off the camber of the road, and, when tramlines have to be crossed, cross them at as wide an angle as possible. Keep your tyres well inflated, but not board hard, for, whereas a soft tyre tends to roll, a board hard one tends to bounce, and so cause the wheel to spin.

The Importance of Correct Alignment.

Be very careful to see that both wheels are in line. In many cases a motor cycle frame gets slightly strained, especially if occasionally used for sidecar work. This causes the wheels to stand at different angles, and should this occur the fault should be remedied at once, and the repair is best left in the hands of the maker.

Note that your spring forks have no side play. This is important, and any shake should be taken up before it causes an accident. The same applies in the case of certain spring frames. If belt drive is used, do not ride with too tight a belt, as it causes jumpy running at low speeds.

Frame design has an important bearing on side-slip, and here is the weak point in the modern very low saddle position, for though one can more easily get one's feet to the ground in case of a skid, one has not the control over the machine that a higher position gives. The saddle should, also be as far in front of the rear axle as possible.

A Practical Illustration.

To illustrate these points, the following instance may be quoted. The writer has been riding a very low semi-racing machine during the past season, and, in spite of the frame being true, the wheels in line, and although all ordinary precautions were taken, the machine was distinctly bad in grease. At the approach of winter, the engine, wheels, tyres, etc., were taken out of this frame and put into a comparatively high frame. The new frame was about 1 in. longer, but the saddle position was nearly $4\frac{1}{2}$ in. higher, and a good deal further in advance of the rear axle. The effect has been to make the machine quite steady, even in the bad grease we have had lately, and in spite of the fact that the tread is worn

off the rear tyre, leaving a smooth surface. Remember that it is a bad plan to carry heavy toolbags on the handle-bars or front forks—even the generator, if a heavy one, is better carried on the frame—as any unnecessary weight on the bars and forks affects the steering adversely.

Non-skid Tyres.

Many and various are the non-skid tyres now marketed, all of which are, of course, "the best," but, as a matter of fact, it is hard to choose the best among those produced by several well-known firms. Probably the best for all-round use are those with rubber studs or patterns, or a combination of the two, for though a steel-studded tyre is a more effective non-skid in certain forms of grease it is often extremely dangerous for a two-wheeler in tramlines or on stone setts. Riders of two and three-speed, or variable geared mounts should not attempt to hold on to their high gears, when going slow in bad grease, and owners of clutch machines should be even more careful than usual not to let in their clutches with a bang.

I have made no reference to corner work, for it is obvious that corners require a certain amount of care and commonsense when the roads are greasy; but it may be as well to add that slowing up gradually on the throttle is preferable to raising the exhaust lifter, and dropping it quickly when the throttle is still open to a fair extent.

General Hints.

- Gear low.
- Do not drive fast or too slow; strike the happy medium.
- Keep off the camber of the road.
- Cross tramlines at as nearly a right angle as possible.
- See that your wheels track.
- Avoid side play in your spring forks.
- Do not go in for the lowest possible saddle position, but arrange the saddle so that you can comfortably put your feet on the ground, and keep it as far forward as possible.
- Do not carry heavy articles on handle-bars or forks.
- Use any good make of non-skid tyre (rubber tread preferred).
- Do not let in your clutch with a bang, and do not "blind" round corners.
- All motor cyclists of long standing know most of these tips by heart, but it is hoped that they will be of use to the later additions to our ranks, many of whom I know have been hesitating to buy on account of the supposed terrors of side-slip.
- In conclusion, let me add that if reasonable precautions be taken and a machine be driven with ordinary commonsense, there is no reason to prevent many enjoyable runs, even on greasy roads.

UBIQUE.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal queries should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Licence for Sidecar.

? I have just purchased a second-hand 8 h.p. Bat and sidecar, and after registering the same, the licensing authority (Cardiff) sent me a form to fill in for the licence. (I have not yet had delivery of the machine.) This form, which appears to be a general one and not issued locally, says that a sidecar requires an additional licensing fee. I understand the one fee of £1 covers both. Would you please advise me on the matter.—F.B.

It is usually accepted that the £1 fee (10s. after October 1st) covers a motor bicycle and sidecar, the combination being regarded as a three-wheeled motor cycle, but some licensing authorities endeavour to enforce an additional fee. There does not, however, appear to be any rule on the matter as regards England, though in Scotland it has been definitely decided that a motor cycle and attachment count as one vehicle. See also reply to "Sidecar," Peckham, page 1412 of last week's issue.

Lightweight for India.

? Briefly I will give you what special points I require in a motor cycle. (1.) Lightness, to enable the machine to be carried without difficulty in and out of boats, the carriers often having to wade thigh deep through mud. (2.) Ability to go indefinite distances on the low gear, over the worst of roads, without overheating, the temperature being 120° in the shade at times. (3.) Accessibility to all parts, and ability to go without constant "fiddling" and adjusting. These are the chief points. Do you consider a P. and M. lightweight would suit my purpose? I should never want to go more than 20 m.p.h.; my weight is under 11 stones. The chief thing, however, is to be able to "crawl" for long distances. Can you recommend the Parsons Rapid repair kit? Does it take the place of solution and patches?—INDIAN POLICE.

We can confidently recommend the machine mentioned in your letter. It is light, will travel long distances on the low gear if driven carefully, and is accessible, while its reliability is well-known. The machine would travel comfortably at 20 m.p.h. We can thoroughly recommend the Parsons repair outfit.

Sidecar Queries.

? (1.) Would a 3½ h.p. machine with two-speed gear be satisfactory for sidecar work, more particularly in the Southern and Eastern Counties, or (2) would it be better to get a 5-7 h.p. twin-cylinder, taking into consideration such points as cost of upkeep, keeping in tune, running cost, etc.? I am the youngest of novices and do not want a machine which might give trouble. It seems to me that a single is so much more simple than a twin. I can alter the timing of my present mount, a 3½ h.p. Bradbury standard, but very much doubt whether I should be able to manage the same job on a twin. (3.) If I arrive at a decision in favour of the single, would it be better to get a new two-speed Bradbury or fix, say, a B.S.A. two-speed to my present mount, a 1911 Standard, or an Albion in the back hub? (4.) What would be about the cost in each

of these cases? (5.) Which is the most economical form of sidecar to run, and which is the safest? My intended passenger is extremely nervous. (6.) I shall be glad if you will give me your candid opinion of the Bradbury machine.—B.P.B.

(1.) The 3½ h.p. machine with two-speed gear would be satisfactory for sidecar work in East-Anglia, but not in some of the Southern Counties, where steepest hills abound. (2.) You had better get the 5-7 h.p. twin, preferably chain-driven. (3.) It would be better to get a new two-speed, chain-driven machine than to fix a two-speed gear to your existing mount. (4.) Of course, it would be slightly more expensive to buy a new machine. You may reckon the cost of a two-speed gear to be roughly £10. (5.) A rigid sidecar. (6.) We have a high opinion of the machine referred to here. It has a larger engine than most single cylinders, and hence is very suitable for sidecar work.

A RACING MONSTER AT THE GOMETZ-LE-CHATEL HILL-CLIMB.

Mouriou and the peculiar design of four-cylinder Rene-Gillet machine on which he hoped to accomplish fastest time. The bore and stroke are 90 x 100 mm., and transmission is by two belts. A well-known formula gives the horse power as 22½.

Trailing Action of Front Wheels.

I have had an argument with a friend of mine, and we have decided to abide by your decision. The argument is this. We both agree that the front wheels of machines trail—or most of them. Now the question is, where and how does the manufacturer get the point from where to trail? How does he arrive at it, or the point to see how much it trails? I say he measures from a straight line down the head proper to the ground. My friend says, down the forks.—CONSTANT READER.

You are right, and your friend is wrong. The amount of trail is measured from the point where the steering axis produced meets the ground. The steering axis is, of course, through the centre of the head, the shape or position of the forks having nothing to do with the matter provided the steering angle of the head and the position of the wheel is laid out as described. The accompanying sketch will make all clear. The distance from A to B shows the amount of trail.

Machine for Sidecar.

Can you thoroughly recommend the Indian motor cycle for outn solo and sidecar work, and (1) would you mind advising me which model to get? (2.) Is the control of these machines really as simple as it seems to be on paper, and is it easy to get used to it after being used to the ordinary two-lever carburettor control? (3.) Is chain drive better than belt drive for an all-weather machine? (4.) Do the automatic carburettor and the mechanical lubricator work well at all speeds, and is the whole machine simple and reliable?—"DI 75."

(1.) Yes, we can thoroughly recommend the machine referred to in your letter. The 7 h.p. with two-speed gear is suitable for sidecar work, more so than any other the company sell. (2.) The control is quite simple, and it is easy to get used to it. (3.) Opinions differ, but we prefer chain drive for constant sidecar work, the Indian drive is quite satisfactory. (4.) Both the automatic carburettor and mechanical lubricator are thoroughly satisfactory, and the machine is reliable.

Porth (Glam.) to Sherborne.

I have it in my mind to go from here (Porth) to Sherborne in Dorset. (1.) Is it possible to do the return journey in one day? (2.) Also could you kindly give me names of most important places on route, and number of miles?—A.W.

(1.) We should not think you could get back in the day, especially at this time of the year. (2.) Your best route would be as follows: Porth, Pontypridd, Caerphilly, Newport, Severn Tunnel Junction (by train to Pilning under the river Severn), thence through Bristol, Whitechurch, Pensford Station, Shepton Mallet, Castle Cary, Marston Magna, to Sherborne. The distance is approximately ninety-four miles.

Croydon to Manchester.

Please inform me as to the best and shortest way of reaching Manchester from S. Croydon, avoiding London, if possible, and the big towns. I am contemplating starting at 5 a.m., and wish to finish the same day. If you could also give me the distance so much the better. The machine to be used is a T.T. Ariel-Swift. I should also like an estimate of the approximate time the journey is likely to take.—P.W.W.

To avoid London you will have to make a rather long detour, and go through Croydon, Castleton, Sutton, Kingston, Hounslow, and Uxbridge. The route is then Amersham, Aylesbury, Buckingham, Towcester, Daventry, and along Watling Street to Atherstone, as far as a point two miles south of Lichfield. Go through Lichfield, Abbots Bromley, Uttoxeter, Cheadle, Leek, Mansfield, Stockport, to Manchester. If you are starting as early as 5 a.m. you would considerably shorten the distance by going straight through London, and passing Regent's Park; go up Finchley Road, through Barnet to St. Albans. You would find far better roads all the way, except in the vicinity of Regent's Park, and not much traffic at so early an hour, whereas the route to avoid London necessitates byroads and roads on which there are tramlines. It is a long ride for one day at this time of the year. The distance is approximately 200 miles.

Re-magnetising a Magneto.

I have been running my motor cycle for three years, and I have an idea that the magnets have lost power, as the spark is very weak. Is it necessary to have them remagnetised, and who is a likely person to do it, and can they be charged too strongly?—W.W.

The magnets of a magneto machine should keep their magnetism for at least three years, probably longer. If, however, you have reason to suspect that the magnetism is not so strong as it should be, which is generally demonstrated by bad starting and failure to run at slow speeds, it would be advisable to send the magneto to the makers, or their representatives. You cannot over-magnetise the magnets.

Three-speed Gears.

I have an old $3\frac{1}{2}$ h.p. Riley, which I have used for the past two years with sidecar and "Fit All" two-speed gear. As the gear is now worn, I should be much obliged if you could give me your opinion of the advantages and disadvantages if any of the following gears for sidecar work with $3\frac{1}{2}$ h.p. Riley engine: (1) Armstrong three-speed; (2) Sturmey-Archer three-speed.—H.C.P.

Either of the two gears mentioned would suit your purpose. Of these (1) is a well-tried article, the top speed is indirect, and the machine can be started on the stand. The other is only just placed on the market, but this has the advantage, in the opinion of some, of having the top speed direct, and engine can be started with the back wheel on the ground.

EXPERIENCES WANTED.

"A. G. B." (Birmingham) desires readers' experiences of the Triumph (FE model) for commercial traveller's use.

"A.W." (Beckford). Fitting a modern carburettor to a 1907 four-cylinder F.N.

"E.B.R." (East Putney). P.V. spring frame with and without sidecar—steadiness in grease and wear of belt.

"W.J.T." (Norton-on-Tees).—1911 two-stroke Scott with sidecar.

"A.J.R." (London). Lincoln Elk, especially as regards life of engine.

Belt side of the latest model $3\frac{1}{2}$ h.p. Brown, with Bowden two-speed counter-shaft gear.

Saddle Spring Arrangement.

The peak A of the saddle is resiliently supported upon the frame B by double lever coil springs C. These springs

are arranged to project backwardly beneath the saddle, so that a neat and effective construction is arrived at.—J. B. Brooks and J. Holt, No. 29,669, 1910.

The Garner Exhaust Whistle.

This exhaust whistle is foot-operated, and does not involve the fitting of any extraneous operating mechanism. It comprises a tube A, having sound holes B, which is connected by an elbow C to a branch D secured by a clip E to the exhaust pipe F, which is, of course, drilled to allow the passage of the exhaust gas. The connection between the elbow C and branch D consists of a screw thread allowing the elbow to be turned to the most convenient angle, and locked by a nut G. Within the tube A slides a piston H, which is normally forced upwards by a spring J, to close the sound holes B. When the piston is depressed by the rod K, the sound holes are

opened, and variation of the distance between the sound holes and the piston provides a variation in the tone produced.—H. Garner and W. J. Parker, No. 11,656, 1911.

The Wooler Transmission System.

This is the patent covering the Wooler driving gear, which comprises an adjustable pulley, mounted upon a rocking quadrant, providing for belt adjustment. The quadrant A is mounted upon the crank case B, and carries a counter-shaft C, upon which is mounted the pulley D, the flange E of which is movable to vary the effective diameter, and therefore the gear ratio. Motion is transmitted from the engine-shaft F to the pulley D by spur or chain gearing G. The operating mechanism comprises a hand lever H pivoted at J and connected to the counter-shaft C through a spring device contained in the cylinder K, the object

of which is to minimise the shocks of transmission. Pivoted on the lever H is a bell-crank lever L, having a sliding guide rod M at one end, and at the other end connected to a face cam N co-operating with a second face cam O for the operation of the movable pulley flange E. The parts are so proportioned that as the lever H is oscillated the face cams vary the adjustment of the pulley, and at the same time the quadrant A is rocked about its pivot to maintain the belt at the correct tension.—John Wooler, No. 24,618, 1910.

Valve Construction.

By this construction the valve stem is protected from burning. The head A is recessed on its underside, and the guide B is extended to a point within the recess. The exhaust gas, in travelling past the valve, therefore only impinges on the guide B, which is of considerable sectional area, and is formed with a radiating flange at D, to dissipate the heat absorbed from the burnt gas.—Rudge-Whitworth, Ltd., and J. V. Pugh, No. 25,474, 1910.

1912 Peugeot Engine.

A single-cylinder Peugeot engine, with bore and stroke of 84 x 90 mm., capacity 499 c.c., is now being handled by Mr. J. Taylor, Warwick Road, Birmingham. The new engine has side by side mechanically-operated valves, and weighs 56 lbs. The flywheels are 8in. in diameter, which should conduce to steady running. The height of the engine overall is 17in., and the width of crank case 9in. It can be obtained with silencer, magneto, and bracket and carburetter complete.

A Portland Street Addition.

A new firm known as Robertson's Motor Agency will shortly be opening premises at 157b, Great Portland Street, W. The managing director of the concern is Mr. Robertson-Brown. They will be agents for the Ivy-Precision, Norton, and Zenith, also sole agents for the Turner sidecar. Spare parts will be stocked of the best known machines, and especially of J.A.P. and Precision engines. They will specialise in F.R.S. and Miller lamps, and lamp repairs will be undertaken. Beginners will be specially catered for. The firm has also arranged for a wholesale and retail agency for the Cowey speedometers. An interesting item in connection with the business is that the whole staff are practical motor cyclists and as the staff is increased only motor cyclists will be engaged.

New model Peugeot single-cylinder side-by-side valve engine, 84 x 90 mm.

Corah and G.N. in London.

Godfrey and Applebee, 208, Great Portland Street, W., have been appointed sole London agents for the Corah motor cycle. They have also been made exclusive West End agents for Indian motor bicycles, while negotiations for the sole agency for the G.N. runabout are almost complete. Their showrooms are well filled with the best known makes of new and second-hand motor cycles and sidecars.

An All-weather Finish.

A demonstration was held recently at Norfolk House, Laurence Pountney Hill, E.C., of work done by the Marino Electrolytic process. Various articles, such as nuts and bolts, were shown galvanised by this method, which, as there is no heat used, allows even steel springs to be so treated without affecting their temper. Zinc or any alloy of zinc may be used, or, in fact, any other metal. There is no possibility of the metal peeling off afterwards. By its aid aluminium can be soldered. The joints are first tinned by the electrolytic process, and then ordinary solder can be used. Readers who are contemplating overhauling their machines, or wish to protect the bright parts of their mounts against the ravages of winter, should make enquiries respecting the process from the Harvey Electro-Chemical Co. Ltd., at the above address.

BROWN BROTHERS, Limited

The "Duco" Combined Belt Punch and Cutter. Punches a hole and cuts the belt to the correct length in one operation. The cutting blade is detachable, so that it can easily be sharpened when necessary. Well made and finished in best style. One size only, suitable for $\frac{3}{4}$ or $\frac{1}{2}$ in. belt. Each 4/9.

"ROBI" SHIELDS. Keep your hands warm and do not interfere with handle-bar controls. Mackintosh lined. Prices from 9/6.

The "Duco" Motor Cycle Lamp. The body is made in one piece, and covered with a heavy coating of vitrified enamel. This highly glazed surface needs only an occasional wipe with a damp cloth. Fitted with mirror lens. No. 11116b. Enamelled black with nickel-plated mounts, 12/- each.

Lodge Motor Cycle Sparking Plug. Gives the greatest satisfaction. Price, 4/- each.

We can strongly recommend our "DUCO" Plugs. Particulars will be sent on request.

"FLASH" Antiseptic Hand Cleaner. "Flash" cleans every thing better and quicker than soap, it leaves the skin absolutely clean and free from injurious and unhealthy matter; never chafes or roughens; is thoroughly antiseptic beneficial to the skin, and may be used with hard, soft, hot, cold, or salt water.

6d. and 2/6 per tin

Motor Cycle Splashes.

All leather. The strongest and most durable on the market. Fitted with spring steel strip, which always keeps it in shape. No. 11548c, size 15 x 12, each 3/9. Patent waterproof leather, supported with spring steel strips. 11548d each 2/6.

Spare Petrol Can.

Neat and compact. Designed with metal loops for strapping to carrier. Enamelled green with brass stopper.

11617a, 1 gall. size, each 2/6.
11617b, 1 gall. size, each 2/-.

"A.K." Knee Grips for Motor cycles.

Give the rider a firm hold on the machine, thereby leaving the hands free to manipulate handle-bar levers. Per pair, 6/6.

Autoclipse Motor Cycle Lamp. The finest light giver and best constructed lamp on the market. Write for new 'Autoclipse' folder, describing latest models.

Improved English Made 3 1/2 in. Centre, Sliding, Screwcutting, and Boring Lathe. The flywheel is balanced, and extra heavy; this, in conjunction with the large cone on the headstock, makes the lathe very powerful. Testing—Every lathe tested to bear twice the strain that any use could put upon it. Full specification up request.

No. 7703b. Bench Lathe only £10 10 0.
No. 7703k, for Treadle or Power £13 10 0.

We invite applications for particulars of any kind of tools

The Bluebird motor cycle type with clip. Brass 10/6 nickel 12/- each. Finished blue, 2/- extra.

Write for 'Duco' Booklet.

The "CELERIO" Belt Fastener.

A thoroughly reliable belt hook which can be quickly detached, but will never slip apart at any speed, will fit $\frac{1}{2}$ or 1 in. belts. Price 9d. each.

'Duco' Model X Combination Rubber & Steel studded Non-skid Motor Cycle Tyre.

A specially strong and heavy non-skid cover suitable for powerful machines, 26 x 2 1/2 in., cover 50/-

The "Challenge" Watch

For fixing on handlebar. Nickel-plated finish. Complete with handlebar attachment with secret fastening, each 5/9.

No. 10299s.
'King Dick' Belt Drill, each 1/6
No. 10299t.
'King Dick' Belt Punch each 1/6.

Motor Cycle Tool Bag. No. 10145a. Metal frame, well made and strong. Size 9 x 3 1/2 x 6 in. Each 8/- NOTE: Latest pattern has one large purse and no fall front.

The "Duco" Adjustable Lamp Bracket for Motor Cycles. Supplied for round or oval clips. Price, each 4/9. Adjustable in every sense of the word, and designed for fixing on the front fork girders and is strong enough to carry the heaviest lamp. Its chief advantage is that the lamp can be tilted to any angle.

MOTOR CYCLE HORN.

No. 11016m, Motor Cycle 2-note Horn, each 4/3

3 1/2 H.P. SINGLE-CYLINDER ENGINE.

THE HEART OF A MO-BIKE IS THE ENGINE.

FIT A

'BLUMFIELD'

(The engine which doesn't get tired)

**and AVOID HEART FAILURE
WHEN HILL-CLIMBING !**

Messrs. Blumfield, Ltd.,
70, Lower Essex St., Birmingham.

Sept. 7th, 1911.

Dear Sirs,

I am the fortunate possessor of a 3 1/2 "Blumfield" Single Engine, and am pleased to testify to its exceptional merits. It is absolutely "Conkless" clean, and has a fine reserve of power on the worst hills I have yet encountered. I have never been "held up" by engine trouble, and never expect to be. I am more than satisfied, and am delighted to give you permission to make any use of this testimonial you may wish.

Yours faithfully, T. RICE.

Tyre Service

The possibilities of the motor cycle were imperfectly realised before the advent of the Wood-Milne Steelrubber Tyre. Users of Wood-Milnes experience more comfort and a greater security than ever before at a much lower cost for tyres. Sweeter running; no time wasted on tyre troubles; no need to slow up on a bit of grease; good for all roads and all weathers.

You do not carry spare wheels on motor cycles—Wood-Milnes carry you further without cuts than any other tyres. Again, a slip on a motor cycle means a spill—invariably—and most likely a bad one. The “bite” of the Wood-Milne cover is marvellous, as there is the double advantage of the splendid non-slipping substance, Steelrubber, combined with the most efficient non-skid patterns that have ever been devised.

Wood-Milne

MOTOR CYCLE TYRES

Designed and built on the same principles as the famous Wood-Milne Motor Car Tyres, and including the wonderfully durable Steelrubber tread. “GRIPRIB,” STEEL-STUDDED, AND RUBBER-STUDDED PATTERNS.

SPECIAL; equal to Extra-Special of other makes.
EXTRA STRONG; equal to a standard car tyre.

The “Special” is suitable for fast work on medium-weight machines. The “Extra Strong” is suitable for passenger carrying machines, and powerful singles. For strenuous work on high power machines, Extra Strong with Steel Studs is recommended.

Wood-Milne Tubes for Motor Cycles, Endless and Butt-ended patterns. Wood-Milne Steelrubber Belts for sure grip. If you golf, Wood-Milne Golf Balls for distance and steadiness combined are unequalled.

The CLYNO

THE SIDECAR MOTOR CYCLE

IT LOOKS RELIABLE—AND
IT IS RELIABLE.

We say—and numerous satisfied owners will fully endorse the statement—that the "Clyno" sidecar machine is the best passenger combination ever offered to the public. We base our claim on indisputable facts—the performance of the "Clyno" in the A.C.U. Quarterly Reliability Trials (non-stop every time), in numerous Reliability Trials (highest award every time), on Porlock and Lynton Hills (first sidecar to vanquish these giants), and in general use (owners invariably satisfied).

: : : : :

The "CLYNO" looks "good," and is as good as it looks. Every detail has been considered carefully by the manufacturers, who are practical engineers and experienced riders. During 1911, "Clyno" machines were subjected to the most severe tests it is possible to conceive, and the valuable experience thus gained is embodied in the improved models we are now offering for 1912.

IT LOOKS FAST — AND
IT IS FAST.

Don't let another day pass before writing for prices and full particulars.

A7

CALTHORPE CONFIDENCE.

It's a feeling as uncommon as it is delightful—

Motor Cyclists who have ridden other Motor Bicycles tell us it's just incomparable—

And it's founded on that "OUT & HOME" quality—the quality which lifts the CALTHORPE to a place apart from every one of its competitors—

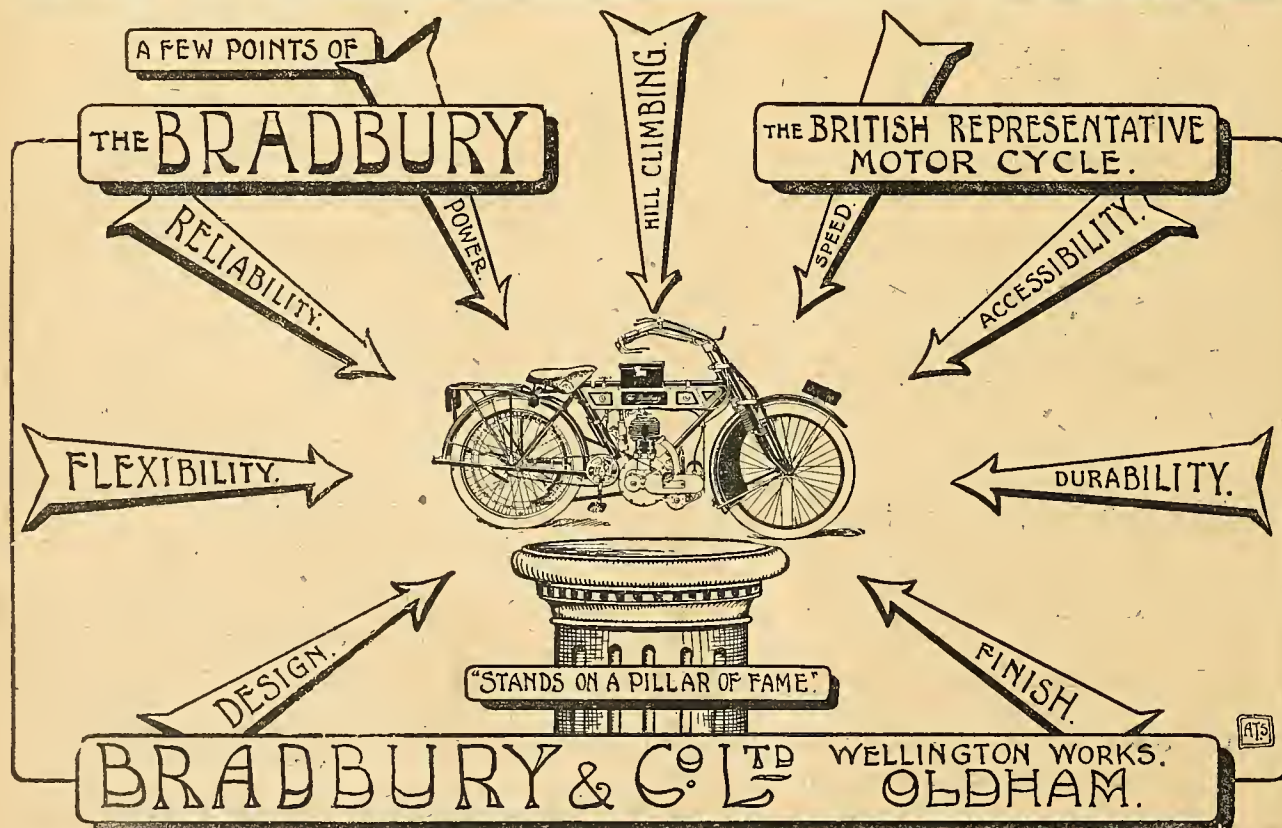

And, mind you, "CALTHORPE CONFIDENCE" does not mean increased initial cost—rather is the bicycle that bears that name easier to buy than any other that we know, and, when bought, costs less in up-keep because of its incomparable dependability.

For 1912 there are two models—THE 3½ H.P. TOURIST and THE 2½ H.P. LIGHTWEIGHT.

You should see them—also the CALTHORPE TWO-SPEED GEAR AND FREE ENGINE.

Let us send you List.

CALTHORPE MOTOR CYCLE CO., Barn St., Birmingham.

What, Lubrication!

*Watch your Drops (of oil) and the Gallons
will take care of themselves.*

Every drop of "RUSOLINE" Motor Oil counts and has full oiling efficiency. It gets right between the rubbing surfaces of the closest fitting bearing, reduces friction to a minimum, and gives you an all-round good result. For motor cycles and other fast revolving engines try Russell Bros.' products. We don't sell on our name alone, but on the good quality of our goods.

*Manufactured under the supervision of
W. RUSSELL*

(late of Price's Patent Candle Co. Ltd., London).

AMAC

International Hill Climb, Gometz, France,

DECEMBER 17th, 1911.

Fastest Time of the Day

was made by Mr. H. Bashall on
a Matchless,

Fitted
with

AMAC Carburetter

against the pick of the World's
International Riders.

THE ASTON MOTOR ACCESSORIES, LTD.,
TALFORD STREET, ASTON, BIRMINGHAM.

Our belief

is that after two years' scientific experimenting—two years' continuous testing—we have produced a Motor Cycle Tyre of absolutely unique merit—a tyre capable of creating World's Records in service and efficiency.

The new Tyre

is named the

**JOHN BULL
CROSS GROOVE**

It is produced by an entirely new process, and is made in three sizes, 26in. x 2in., 2½in., and 2¾in., and two strengths, viz.—"Standard" and "Tourist Trophy."

Absolute efficiency

has been our sole aim in its production—an unequalled service the object we have ever had before us—consequently we compete on quality and not, as others do, on price alone.

Policy

Ours is a "JOHN BULL" proposition—we offer you the tyre—ALL-BRITISH—unequalled in material and service and, as its price, we ask its true value.

Your order

We are anxious for your order—not for the value of it in itself, but for the repeats and recommendations which we know will follow.

Ask your agent for particulars, or, as a first step, write us for Booklet and large section.

THE LEICESTER RUBBER CO.,
Granby Rubber Works, Leicester.

—1912—

REX SIDETTES

Our Leading Lines.

To the Prospective Purchaser of a Passenger Machine.

The two most important points to consider are the Engine and the Two-Speed Gear.

The New Rex 4 h.p. Water-cooled Sidette de Luxe.

The New 6 h.p. Twin de Luxe Sidette.

The new Rex engines are of entirely new construction, and built on the most up-to-date and practical lines.

The valves are all side by side and interchangeable.

The bore and stroke of the 6 h.p. is $77\frac{1}{2} \times 95$, and the 4 h.p. $84\frac{1}{2} \times 95$.

These new engines have been thoroughly tested, and we can confidently recommend and guarantee them without fear. The new 6 h.p. is a revelation of flexibility, reliability, and reserve of power.

The Rex two-speed gear (made under Roc license) is now too well known to need much elaboration here. The great points about a two-speed gear are, that it should be fool-proof, reliable, and efficient—THE REX Two Speed Gear embodies all three points.

The chassis on the Sidettes is splendidly sprung with both C springs and coiled springs. The body is of exclusive design, and is manufactured of close woven cane. It is luxuriously upholstered on the lines of the most up-to-date car, and to ride in either of these Sidettes is a revelation. The body is on the Torpedo style, and fitted with side door.

The press were unanimous in their opinion that at the recent Motor Cycle Show at Olympia this combination was one of the finest and most practical exhibits in the Show.

PRICES:

6 h.p. Sidette - £75.

4 h.p. „ - £74.

Catalogues sent post free on application.

A TIMELY TALK to winter riders.

The weather is miserable, and if you appreciate real comfort awhile during the winter months, ensure it by the fitment of a P.M.C. Sidecar—with this Sidecar, you will be absolutely immune from side-slip, even upon greasy tram lines and sone sets—and the ease with which the machine can be manipulated in traffic without taking the feel off the foot rests gives added comfort and confidence of control. The ease of attachment, light weight, and scientific construction, make the P.M.C. the most practical and efficient Sidecar on the market.

Price, Coachbuilt, £7 12 6

„ Wicker, £5 17 6

Our 1912 Catalogue, containing a complete range of Sidecars, will be of interest to you. Copy sent post free on application.

THE PREMIER MOTOR COMPANY, LTD.,
ASTON ROAD, BIRMINGHAM.

Telegrams—"Primus, Birmingham."
Telephone—Central 4310.

PATENT 1442.

With our Quickfit Couplings any sidecar can be attached in sixty seconds, and detached in forty seconds. SINGLE-HANDED. NO TOOLS REQUIRED. SAFER than ordinary fittings—no nuts to come off or bolts to "strip." The strain on frame tubes is greatly reduced. Price 30/- the set of three couplings, to fit any make. 5/- allowed on old fittings (any make).

Start the New Year Well

by getting in touch with me and securing one of my "Perfect Second-hand Motor Cycles," or, if you require a new machine, no matter what make, delivered when you require it, I am your man. I keep adding names of satisfied clients to my weekly list. If you have any doubts as to our straightforward way of doing business, you ought to send to us for one of these, and get in touch with an uninterested adviser. Ask who we are, and how we conducted our business transactions with them. If you are near enough to us, give us a call. We won't press you to buy, but we think, after a personal inspection, that you will agree with us in saying, "We sell only guaranteed perfect motor cycles." Our Second-hand Motor cycles can be trusted to give you entire satisfaction. If they don't, send them back, and we will return your money. We cannot speak fairer than this. Our 1912 models are now arriving, and we shall be delighted to have your order. Please don't forget, if you have a motor cycle now and want to exchange, we are the best firm in the trade for you to get well served by. Expert assistance and advice gratis. Send me your enquiry now, and I shall have our best attention. Compliments of the season to you all, and good luck!

In answering these advertisements it is desirable to mention "The Motor Cycle."

Official
Repairers
to

Royal
Automobile
Club.

The most important point to be borne in mind when buying a second-hand motor cycle, is that unless the machine is in perfect order you will find yourself faced with the alternative of either riding a machine in an unsatisfactory condition, or making repairs and replacements, which will bring the total cost up to an amount you did not anticipate, and have probably not provided for. This would make your purchase a very questionable bargain.

You can ensure satisfaction by entrusting us with your order. We minutely overhaul every second-hand machine we offer for sale, and are, therefore, in a position to guarantee their condition.

May we send you our list?

Don't have a Funeral.
 Try a **SENTINEL SWITCH**
 instead—it's cheaper.

 Riders who use magneto machines should have
 perfect control over the ignition: you cannot get
 this by lifting the exhaust, or by using a spring
 contact affair—what you want is a Switch with
 a quick easy action, one that will fly off, or on,
 with a touch of the finger, leaving your hands
 free for brakes and other trouble.

 The Sentinel does all this, and, what's more,
 it's just the smartest fitting ever fixed on a
 handle-bar, not a bit unsightly—made of solid
 brass, with real stay-on plating. Suitable for
 Battery or Magneto Ignition—try one.

Copy of unsolicited testimonial received from
Mr. A. S. BRIGHT.

Glazebrook, 52, Elfindale Road, Herne Hill, S.E.,

16/5/11.

Dear Sirs,—On Saturday last I was entered for the South Eastern Club's Hill Climb. On the Friday I was unfortunate enough to have an accident and to damage the engine. Unable to effect repairs in the time, I took my courage in both hands, and got Mr. Dixon, of the New Hudson Co., to wire you to afford me facilities. I arrived at 8.30 a.m., Saturday, and demanded an engine you had not in stock, but you kindly put a fitter on assembling what parts you had. At 9.25 I left in a taxi with an engine incompletely assembled and untimed, minus valve caps and some other oddments, and which had never smelt gas, let alone having been run on the testing bench. I had wired to Mr. Dixon to get the other parts to Herne Hill and I met him at the station. We erected the machine in the train and timed it on the railway platform. This machine, untested and untried, made fastest time in the lightweight class, and secured a silver medal in the single cylinder touring class. I think this is a very striking testimony to the magnificent work and accuracy of finish you must put in. That an engine which, five hours ago was pieces of iron, should beat in open competition carefully adjusted and timed machines, on one of the stiffest hills I have encountered, is an achievement of which you may well be proud.

Yours faithfully (Signed) **A. S. BRIGHT.**

Are you nervous ?

If you are, probably that is why you do not enjoy motor cycling, or, it may be, why you have never taken up this fascinating means of locomotion. We make a special appeal this week to such as you, because we know from wide experience that the special features of the shaft-driven lightweight

2 $\frac{1}{4}$ h.p.

Motor Cycle

are capable of developing your powers of self-possession. How can it do this? Briefly, by its lightness, which renders it sensitive to steering; by its perfect balance and proportion which enable it to be handled with ease in even the most awkward places; by its automatic devices, such as the carburetter and lubrication, which relieve your mind and attention of the important functions performed by them; by its wonderful simplicity of handle-bar control, the operation of which would in a short time become second-nature to you—impossible to make a mistake; and last, but not least, by its powerful brakes. Your safety, as well as your pleasure, is thoroughly ensured if you ride this machine. Our Illustrated Booklet, which is supplied free, will tell you much more fully about the great advantages possessed by this F.N. machine.

A FINE TRIBUTE to the DURABILITY of the **PALMER**— the SCIENTIFIC TYRE.

MR. HARRY A. COOPER,

Grove Cottage, Keston, Kent, writes:

29th May, 1911.

"You will no doubt remember that I had a pair of your Cord Tyres on December 20th to fit on to my new Bradbury. These have now done 7,000 miles and until last week I did not have a

puncture. I have never had a suspicion of a side slip.

During the M.C.C. Mid-Winter Run to Exeter and back I was as comfortable as in a train and never touched my tyres once.

The following trials vouch for the Reliability of your tyres.

M.C.U. 24 hours' run to Exeter and back, December 26th and 27th, Gold Medal.

January Quarterly Trial. First Class Certificate and fastest time up Westerham.

Kentish Hill Climbing Tour, February 26th, "Motor Cycling" of February 28th says: Star Performance on Cudham and Hogs Trough Hills was made by H. A. Cooper.

April 29th. Purley Club Hill Climb, fastest time of the day.

May 13th. South Eastern Open Hill Climb, 1st in class 3 for T.T. Models and second fastest time of day.

I am certain that for Reliability and Speed your tyres cannot be beaten.
